Around the forelands the women ply the knife in a competitive spirit with lightning speed; and while they work, the air is often filled with the strains of popular songs and hymns, interspersed with the Gaelic music of the Highland girls, sung by these toilers to while away the midnight hours. On such a night, a fishing-town has an appearance quite unique. The lurid glare in a murky sky of the many lights burning in the yards, has a very weird effect; while the roll of carts and the shrill cries of the fisher-girls, mixed with the stentorian tones of 'the maister' issuing his orders at dead of night, give a romantic touch to the picture. Often among the gutters are to be found most respectable, educated females, who are tempted by the high remuneration paid to engage in the work, and who, when the fishing is over, assume another character, and may be seen at the Christmas balls in some of the smaller towns as the leaders of fashion. It may be noted here, that after being gutted, packed, and salted, the herrings are allowed to lie in barrels in the curing-yards for some little time. The barrels are then filled up, and otherwise completely cured; and having received the brand of the Fishery Board as a certificate of good quality, they are despatched to Germany and Russia and other centres where herrings form a staple article of food. The salting of herrings has hitherto been the chief method of curing; but recently, boric acid has been introduced for the same purpose, though how far it will be adopted in practice, is still a question of the future.

One feature of the fishing which presents an unusually pretty and romantic sight may be seen on a dark night towards the end of August. At that time the boats are usually within a mile or two of the shore; and when the gloaming deepens and the nets are shot, the crews prepare to hoist the lights required to be exhibited by law to prevent accidents happening with passing vessels. As darkness sets in, light after light appears, till the sea for a stretch of many miles is transformed into what seems a gaily illuminated city; but instead of the Cin and hustle associated with such an occasion, not a sound is heard but the gentle ripple of the summer sea, as its wavelets frolic on the sandy beach, or thread their way round the rocks near the old tower. The sight is ever new, and one so pretty and so fascinating, that on every occasion when it is available, the whole community, including those who have been privileged to witness it for a lifetime, eagerly seek the points of vantage where they can best view the fairy-like scene spread out before them.

In mostly all the great herring-fishery ports, the harbours during winter have a most oppressive stillness, and often the trade done for a protracted period would comprise the arrival and sailing of a few colliers and a limited number of windbound ships. In spring, the scene changes, however; and by July, every available inch of water area is appropriated to the use of craft employed in the staple industry; and at times so great is the pressure, that many vessels are obliged to lie in the bay and wait their regular turn before being permitted to enter the harbour. In addition to our own ships, a great many German vessels have been hitherto engaged carrying herrings; but within the last two years, Norwegian steamers, which were employed in the Norwegian herring business before steam was introduced here, have greatly taken up the carrying-trade, to the serious exclusion of the British sailing schooners, which held the trade in their own hands for half a century, and considered it strictly their own. In consequence of the altered aspect of affairs, a strong feeling exists among the old-fashioned mariners, especially the local skippers, against what they consider an unjust usurpation of their exclusive right, and many an aged salt may be heard sighing for the 'good old times.' But in spite of their quarter-deck arguments, which appear as old-fashioned as their craft, steam-carrying power is fast increasing; and it is more than probable that the once smart fleet of schooners, whose employment in the herring-trade was wont to yield the year's dividend to the owners, will soon be practically a thing of the past.

The social aspect of the fishermen engaged in the herring-fishery has undergone a remarkable change within the last quarter of a century; and the noisy, hard-drinking, indigent toilers of the deep have given place to a race of sober, industrious, religiously inclined class of men, who in many instances have amassed and have at their credit in the bank large sums of money. On the north and north-east coasts, thirty or forty years ago, fishermen as a class were reckoned amongst the hardest drinkers of the population, and one curious custom then existing, but which happily disappeared many years ago, was rather a strong proof of the not very enviable character attached to the men in those days. Before finally settling the terms of an agreement with the curer, the skipper always satisfied himself that one important clause was safe, which was to the effect that the curer was bound to supply a gallon and a half of whisky weekly for the exclusive use of the crew while prosecuting the fishing.

As years rolled on, the habits of fishermen gradually improved; and when the temperance movement spread its branches over the land, no class enlisted under its banners more readily, and no section of the community was more enthusiastic or adhered more firmly to the teetotal principles than did this section of the seafaring class. In a remarkably short time the thatched hovels gave place to neat stone and lime cottages; and the fishermen, instead of spending their evenings in the public-house, preferred either to stay at home and mend the nets or join in some temperance or religious movement which often necessitated a walk of

a good many miles to the chief town in the district where these meetings were usually held. The religious tone in most of the villages on the north-east coast and Moray Firth continues marked; and many of those whose conduct a generation ago was a reproach to their village, not only are now in comfortable circumstances, but take an active interest in all local affairs, and can conduct religious meetings in a way that would do credit to those regularly trained for the ministry.

Fishermen are not naturally cosmopolitan in their nature, and take comparatively little interest in matters not directly affecting themselves; but if a tawling agitation is being promulgated, or if a sudden gale deals destruction to fishermen anywhere on the coast, the villagers evince the greatest anxiety to obtain the latest information. War or rumours of war exercise a strong influence on their minds, and the weekly newspapers are anxiously looked for, and the reports on the subject keenly discussed; but stirring questions of national importance seldom or never disturb the equilibrium of village life. A local oracle is here and there met with, and though his learning may not be profound, he has sufficient ability to represent with some degree of intelligence the opinions or wishes of his fellow-villagers at any time that a question affecting their welfare is prominently before the public. Some of these oracles are vain of their learning; and many good stories are in circulation in the fishing districts indicative of their anxiety to air their learning, especially when a big word could be utilised, whether it suited the sense or not. One good example happened in Fraserburgh not many years ago on the occasion of an accidental meeting of a minister and a leading villager. During the fishing season, the minister was visiting in a part of the town where a row of small houses were built on exactly similar lines; and finding it difficult to distinguish his parishioner's house, asked a fisherman—at the moment remarking as to the similarity of the buildings—where the individual whom he wanted resided. The man drew himself up, and with the intention of impressing the minister with his erudition, proffered his services with the following remark: 'Weel, sir, I'm no a bit surprised at your difficulty, for the houses on this street are most unaninous.'

As has been already indicated, fishermen do not trouble themselves with the affairs of state, and the result is that food for conversation limits itself to incidents in their daily life, which, though at times painfully exciting, is oftenest most uneventful. During the herring-fishing season, when the men often do not see one another from Monday to Saturday, part of Sunday is invariably spent in discussing the results of the previous week's work. 'Between sermons,' three, four, and sometimes half-a-dozen fishermen congregate at a relative's or an acquaintance's lodgings, and having seated themselves, some on chairs, some on chests, and others on nets, and filled their pipes, proceed to narrate their experiences of the past few days; in the course of which, one man describes how, after sailing east-north-east, and putting Mormond Hill down, he shot his nets, and was rewarded with a good take, but got much destruction to netting in

consequence of other boats having shot over his 'fleet;' while another recounts most minutely every night's work from leaving till returning to the harbour, and explains that though they had been upon different grounds, they had failed to meet with any luck, although their neighbour Sandie, who was alongside of them, one night had got seventy crans. In this manner each skipper gives a little history of the week's labours; and the company having exhausted their store of news, take their departure to their respective homes, probably not to meet again till the following Sunday.

MY FIRST PATIENT.

'... And may I beg you to visit us in your private rather than in your professional capacity? Since my dear wife has been failing thus sadly, she has evinced a great dread of medical men; and were she to guess you other than an ordinary guest, I tremble for the consequences! The carriage will meet you at Blackburne Station at whatever hour you name.—Yours very truly,
ARTHUR CRAWFORD.'

This is an extract from a letter that I received on the 10th of June 1870, and being but a young fellow of twenty-six, I was very much elated thereby. The grand drawback to being what is called a specialist is that the generality of people—for what reason, I have never been able to discover—are afraid to employ you until you are well on in years, and consequently this Mrs Crawford for whom my services had been enlisted was my first private patient. My speciality was madness; and tiring equally of hospital-work and of idling in my own rooms, I was heartily thankful for the good luck that had befallen me. In a previous letter, Mr Crawford had given a detailed account of his wife's symptoms; and now all arrangements were completed, and I was due at his Berkshire home on the following day.

When the train steamed into the little country station, I found a carriage and pair ready to meet me. Evidently, to judge by the general get-up of the whole thing, the Crawfords were wealthy folk; and this impression was confirmed when we reached the house, which was standing in the midst of a lovely park. In true country fashion, the hall-doors were standing open, and my host met me on the threshold with outstretched hands.

'This is exceedingly kind of you,' he said genially, 'for I know you have come at your very earliest convenience.—Journey from town pleasant?—Yes? That's right.—James, take Mr Lennox's things to his room. Lunch in the morning-room, hey?—Come along, my dear sir; you must be half-famished.' So saying, he preceded me down a long corridor, whence I caught distant glimpses of a beautiful garden at the back of the house, and into a snug little room where luncheon was laid. While I discussed a cold chicken, Mr Crawford went on chatting; and ere I went to my room for a wash and brush up before presenting myself to his wife, we were excellent friends. I do not think I ever met a man who so much charmed me at first sight; may be, more than charmed, he captivated me. He was about thirty, and exceedingly handsome,

with fair curly hair, and bright blue eyes. He had a bronzed complexion, and a hearty laugh, and was altogether a most attractive specimen of a young Englishman. When I had finished luncheon, his manner changed abruptly as he began speaking of his young wife.

'I did not like to enter upon the subject before you were rested,' he began courteously; 'but I am intensely anxious you should see her. For some months past she has been suffering from intense melancholia, and lately she has taken a deep distrust of those around her, more particularly of me.' He stopped abruptly and bit his lip. 'Doctor, I simply worship her,' he went on passionately. 'When I married her five years ago, she was the blithest, merriest girl in all the shire; and now, to see her like this—why, it breaks my heart!' and he dropped into a chair and hurried his face in his hands.

There was an awkward pause, for in those days I was too inexperienced to be much of a hand at consolation, and then I stepped nearer to him and laid my hand upon his shoulder. 'Come, come,' I said cheerily, 'there is no need to despair like this. We must hope for the best. How does she show her distrust of you?'

He raised his head to answer me. 'By keeping the boy from me, for one thing. She will hardly let me touch him.'

'The boy? A son of yours?'

'Our only child,' he answered.—'A dear little fellow of nearly four; and she betrays a terrible fear whenever I have him with me.'

'Does she eat well?'

'Hardly at all.'

'Sleep at night?'

He shook his head; and then followed a string of various professional questions. Our conversation at an end, I requested to be shown to my room, promising to be in the drawing-room for five o'clock tea, when I should be introduced to Mrs Crawford.

'As Mr Lennox, if you please,' suggested her husband as we crossed the hall. 'You remember that I asked you to drop the doctor, and seem an ordinary visitor?'

Of course I agreed; and then he told me he had spoken to her of me as an old college friend; and finally he left me to myself.

When I descended to the drawing-room, I found both Crawford and his wife waiting for me. He was standing by the open window playing with the climbing roses that were nodding by its sill: he was talking merrily as I entered, and looked the personification of life and good spirits. A girl was standing by the mantel-shelf with her back towards me, and I had barely time to admire the slight figure and graceful pose, before Crawford's voice rang out in hearty cordiality.

'Ah! there you are at last! Let me introduce you to my wife.—Beatrice, this is Mr John Lennox.'

She had half turned when he began speaking; but as he said my name, she gave a sudden gasp and confronted me with large startled eyes. I have seen the eyes of a snared bird and those of a hunted stag, but I have never seen such a look of piteous fear as dwelt in hers then. For one moment she seemed half mad with terror; but the next it fled as quickly as it came, and

she held out her hand in greeting. As she did so, an ugly scar on the smooth white wrist caught my eye. It looked to me like an unskilful but intentional cut from a knife, and while we were exchanging commonplaces as to my journey, &c., I was wondering as to whether she had ever attempted her own life. She was in the first flush of her womanhood; and her glorious blue eyes and coil of auburn hair would alone have sufficed to stamp her as a beautiful woman, had it not been that the curious expression of her face outweighed every other fascination. She gave me the impression of being literally consumed by a terrible dread, to the nature of which I of course as yet held no clue; and with this dread, an equally strong desire to suppress all outward indication of it. Add to this, the fact that her face was entirely colourless, and that the hand she had given me, in spite of the June sunshine, was as cold as ice, and it will be seen that my first case promised to be full of interest.

She poured out the tea silently, while her husband and I went on chatting, and she did not speak again until he proposed to ring the nursery bell.

'We have not seen Bertie all day,' he added, 'and I know you would like to show him off to Lennox.'

'He is having his tea,' she rejoined quickly. 'Show him off in the morning, Arthur; I don't think we want him now.'

'O fie! There is an unkind mamma! I wonder what Bertie would say to you? He can finish his tea here, dear. I'll fetch him.'

'No, no; I'll go.' She ran out of the room as she spoke; and Crawford turned to me with a weary-looking smile.

'You see, Lennox? I generally give way; but I am afraid of it growing upon her, if I never see the child. He is such a splendid fellow!' As he spoke, his wife returned with the boy in her arms.

'I met him in the hall,' she explained; 'he was just coming in from his walk.—No, Arthur, don't take him: he is not at all heavy.' This last to her husband, who had advanced with outstretched hands. 'Look here, Bertie, darling. Who likes cake?' She seated herself on a low chair, still keeping a jealous arm around the child, and went on talking, this time to me. 'Arthur and I quarrel over this small boy.' She laughed a little, but it sounded very mirthless. 'The last cause of disension is his health. I think he is growing delicate and wants change, and papa doesn't agree. Does he, my beauty?'

The boy laughed as she held him yet more closely to her; and looking at his rosy cheeks and bright eyes, it seemed to me that there could not be a healthier youngster.

'I am afraid I must take papa's side,' I said. 'You must not alarm yourself unnecessarily, dear Mrs Crawford, for I think'—I stopped abruptly, alarmed by the expression on her face. I was new at my work, he it remembered; but I think that older men than I would have been frightened. Bertie had rebelled against the detaining arm; and sliding on to the floor, had run to his father and climbed into his arms.

A fine game of romps now ensued, and the mother sat and watched them. Sitting there facing her, I, too, was watching. In my student

days, I had kept a tame lizard, and by whistling to it, had been able to direct its movements at will, and now I was reminded of my whilom pet by watching Beatrice Crawford's eyes. Every motion of her husband's, as he ran round the room tossing the laughing boy in his arms, appeared to hold a fascination for her, and her gaze never left him but once. That once was when she walked swiftly to a further table and possessed herself of a paper-knife, which she handed to me, commenting on its curious make. It was of steel and sharply pointed; and I handed it back again with the remark, that it would make a nasty weapon if needed. She took it without glancing at me again; but her husband had caught her words, and now came up to us breathless and laughing, with Bertie clinging round his neck.

'Don't fear that thing, my darling,' he said tenderly. 'I hate to see such an ugly knife in your dear little hands.'

'Give it to Bertie, mamma,' cried the child, stretching dimpled hands for the coveted treasure; and his father, with an injunction to be careful, was taking it from her to give to him, when, with a muffled cry, she snatched the knife back and dashed it through the open window into the garden beyond.

'You shan't have it!—you shan't have it!' she cried excitedly, while a bright red spot burned on either cheek. 'You would'—With marvellous self-control, she stopped dead short; and after an almost imperceptible pause, she added in her usual quiet tones: 'Pray, forgive me, Arthur; I am so afraid of Bertie hurting himself.—Go up to the nursery, dear. Mamma will come to you.'

Awe-struck at her late passion, the child went gently out of the room, and his mother following him, I was left alone with Crawford. It went to my heart to see the pained, drawn look on his face; but the scene had at all events put one thing beyond a doubt: Mrs Crawford was not merely failing in brain-power—she was mad.

A couple of days went by, and I became fairly puzzled. All the ordinary verbal tests when applied to my patient proved complete failures. Her memory was excellent, and indeed in this respect she was far better than her husband, who was constantly forgetting things. As to her judgment, it struck me as above the average, for she was a widely-read woman, and we had a stiff argument one night as to the merits of our favourite authors. She managed her own housekeeping, and capably she did it too; and, in fact—not to exhaust the reader's patience by entering into details—the only visible outcome of her mental aberration was this extreme terror in which she lived, and for which I could find no reason. (I may remark parenthetically that the mad undoubtedly have rules of their own by which they are influenced. Experience thus teaching me that Mrs Crawford had some reason for this, to us, inexplicable dread—even though it might be but a fear of her own shadow—it became my business to solve this reason.) What baffled me most was the fact that while it was Crawford himself who primarily excited this terror, she was undeniably fond of him. Indeed, the word 'fond' is

hardly suitable, for she simply adored him. I never heard him express the slightest wish as to the household arrangements but it was instantly fulfilled; while every whim—and he was the most whimsical of men—was implicitly obeyed. In fact, at the end of a week I was precisely in the same state as when I first entered the house. But that my *amour propre* was piqued, and I felt angry at my non-success, I should have been paying a very enjoyable visit. Arthur Crawford made a capital host; and although, as I have already said, he was a very whimsical man, and was subject to unaccountable fits of depression, he and I got on excellently together.

At the end of the week, something happened which had the double effect of lowering me several inches in my own estimation, and of placing matters in a totally different light. It was an exceedingly hot night; and after we had all gone to bed, I was tempted to leave my room, and seating myself by the open window in the corridor, to indulge in an extra cigar. The fact that it was a fine moonlight night, and that while the corridor window boasted a lovely view, that of my own room looked into the stables, amply justified my choice of a seat. I had been there for perhaps an hour, when I heard the Crawfords talking in their room, which was on a level with my own. The tones were excited and eager; and fearing that Mrs Crawford might be lashing herself into a fury, and that her husband might be ignorantly increasing it, I stole down to their door and stood listening.

'Arthur, dear, give it to me. You don't want it to-night. Why not wait until the morning?'

These were the first words that I caught spoken in Mrs Crawford's usually gentle tones.

'Give it to you?—No; not I! I know a trick worth two of that. Ah, you think I don't know that you and that confounded mealy-mouthed doctor are in league against me.'

Crawford's voice, shrill and mocking, but undoubtedly his. Good heavens! was the man drunk? There was a moment's pause, and then he began again, this time more gently.

'Come, come, Beatrice. Drop this stupid joking. I only want to have a little cut at Bertie, just a little cut; and look! the knife is so bright and sharp, it cannot hurt him much.'

The wall seemed to reel around me as I leaned against it for support. In a flash of revelation that nearly blinded me, as I realised the full horror of the situation, I understood for the first time how matters actually stood. Crawford himself was the madman, and the devoted wife, whom I had been taught to look upon as insane, had known the truth all this time; and knowing it, for some inscrutable woman's reason, had shielded him, perhaps at the cost of her very life. In a moment the meaning of his many whims, his loss of memory, his fits of depression, were made clear to me; and as I thought of the martyrdom through which his girl-wife had passed, I cursed myself for the readiness with which I had been duped.

While these thoughts were rushing through my brain, I had noiselessly opened the outer

door, and now stood in the dressing-room, peering into the bedroom beyond. The door between the two was standing open; but a heavy curtain hung in the aperture, and by making a little slit in it by means of my penknife, I was enabled to command a view of the interior. At the farther end of the apartment lay Bertie asleep in his cot. Standing before him, clad in a long white wrapper, and with her auburn hair flowing over her shoulders, was the young mother herself; while at some paces from her stood Crawford, still in evening dress, and balancing in his fingers a long glittering dagger, that I recognised as one that usually hung in the library below. By this time he had dropped his angry tones, and was speaking in his accustomed pleasant fashion. 'You know, dear,' he was saying, 'it really is necessary that we both drink some. Half a glassful of young and innocent blood, and we both shall keep young and happy for ever.'

'Won't my blood do?' asked the girl desperately. She stretched her bare arms towards him and forced a smile to her poor quivering lips. 'You are much fonder of me, aren't you, dear? I shall do much better.'

He laughed softly. 'No, no, my darling; not you. I wouldn't hurt you for all the gold of all the Indies.' He stopped suddenly, as if struck by his own words. 'Gold!' he repeated. 'Ah! yes, of course, I must have gold. Where did I put it now?'

He retreated a few steps, looking uneasily from side to side.

'Perhaps you left it in the library.—Ring for James. Or go to Mr Lennox, Arthur; he will help you to find it.'

He laughed again—a low monotonous laugh, to which my hospital-work had but too well accustomed me, and then he moved nearer her, still balancing the dagger in his long nervous fingers. That terrible knife! If he had only put it down for a moment, I could have rushed in and secured it before turning to him; but as matters were, cruel experience taught me that the instant he caught sight of me, he would rush to the child, to carry his dreadful purpose into effect, and that the mother in all probability would fall the victim. On the other hand, I dared not quit my post to summon assistance, and so leave Beatrice entirely at his mercy. I glanced round the dressing-room, and the window-cord caught my eye. It was new and strong. I cut it as high as I could reach, and crept back to my hole at the curtain. Crawford was growing rapidly angry.

'Give me that boy!' he cried roughly. 'Get out of the way, Beatrice, and let me have him;' and he caught her by the arm and dragged her from the cot.

'Arthur, Arthur! husband, sweetheart!' She clasped both arms around his neck, and raised imploring eyes to his; but the sight of the thin white face only moved him to greater wrath.

'It is all your fault I have not made you strong long ago,' he exclaimed irritably. 'You never laugh now, and you can't sing, and you won't dance.'

'Dance? O yes, I can. Look, Arthur!' She drew rapidly back towards the cot, speaking in

her ordinary quiet voice. 'You shall do what you like with Bertie; I was only joking. Only we must have our dance first, you know.'

With a sudden movement, she stooped and lifted the sleeping child from the bed, talking all the time in an arch merry voice, that still retained its old power over the poor madman. He nodded approvingly as she began rocking to and fro with the boy in her arms, and he moved a chair or two, to give her more space.

'Dance, Beatrice!' and he began whistling a then fashionable valse, heating time to the air with the dagger, of which he never relinquished his hold.

'Very well,' she responded cheerily. 'Stand by the mantel-piece and give us plenty of room. Now, then, my baby boy; one, two, and off we go.'

My life has shown me instances of self-devotion in plenty; I have seen proofs of ready wit, and more of indomitable pluck; but I have never seen them so marvellously combined as on that terrible June night. Instinct taught me what she meant to do. She had persuaded her husband to stand at the end of the room farthest from the curtain that hid her one means of escape, and now she intended to hazard her only chance, dash through it, lock the door on the other side, and then go for help. Backwards and forwards, round and round, she circled, a weird enough figure in her white draperies. The little white feet were bare, and it taxed her utmost strength to hold the heavy boy in her arms; but with a sublime heroism of which I should never have believed her capable, she never once paused for breath. A miracle alone kept the child asleep; but when I saw the poor mother's lips move dumbly between the snatches of the gay valse she was humming, I felt that she was praying God he might not waken. Nearer and nearer the curtain she came; but, to my horror, I perceived that Crawford was growing uneasy and advancing slowly in the rear.

'Mrs Crawford! Quick!'

There was not a minute to be lost. I tore the curtain aside, and she rushed towards me; but ere I could fasten the heavy door, her husband was upon us. With a yell of baffled rage, he was tearing after her through the open doorway, and in another moment would have reached her with uplifted knife, when I tripped him up, and he fell headlong to the floor. He was stunned by his fall; and while I fastened his hands and feet by means of the cut window-cord, his wife went back to the inner room and rang loudly for assistance.

Ere he came to himself, Arthur Crawford was safely secured in my own room. Leaving him there under charge of the men-servants, I went back to seek Mrs Crawford. She was lying on the bedroom floor with her nervous fingers still tightly interlaced, and by her side sat her little son, warm and rosy from his broken sleep. He was kissing the paling lips as I came hastily into the room, and now held up a warning finger as I knelt beside them.

'Poor mamma is fast asleep,' he whispered. 'And she is so cold!'

She was not dead. The long and frightful mental strain through which she had passed

brought on brain-fever, and for some days we despaired of her life; but she came through it bravely; and ere the summer waned, I had the satisfaction of installing both mother and son in a seaside cottage, far enough away from her Berkshire home.

Crawford, poor fellow, only lived a few months, for a dangerous fall in the asylum grounds put a merciful termination to his confinement. During those few months, I visited him occasionally, and he always spoke most tenderly of his wife, whom he imagined to be dead.

When he died, I went to break the news to his young widow; and while staying in her pretty Devonshire cottage, I solved much that had puzzled me. Her terror at my first introduction to her had been occasioned by the fact that she had once recognised me as Lennox the mad doctor. I had been pointed out to her in the park the season before. She dreaded Arthur's incipient madness being known to any one; for she had a blind terror of a lunatic asylum in connection with her idolised husband, and hoped that a quiet country life, free from trouble and contradiction, might in time restore him. But had he never broken out before? I asked, for it seemed to me incomprehensible that so slight a frame should be capable of such courage. Once, she said, only once, and then he had been bent on killing himself. In struggling with him for the possession of the knife, he had accidentally cut her wrist, and so occasioned the ugly scar that disfigured it. As for Bertie's presence on that fatal night, she told me he had always been accustomed to sleep in their room; and as I had refused to second her theory that the child wanted change of air, and so aid in sending him out of the house, she could devise no other means of getting rid of him.

And then I took my leave; and I have never seen Mrs Crawford from that day to this; but still, in spite of a certain pair of sweet brown eyes which make the sunshine of my home, I am forced to admit that there is no woman on earth for whom I have such a boundless admiration as for that unfortunate lady of whom I at one time thought as my First Patient.

FYVIE CASTLE.

GREAT are the vicissitudes of landed property in these modern times. Estates of more than local name are constantly being placed in the market, and even manors and castles of national interest are occasionally brought to the auctioneer's hammer. Old families are dying out or becoming embarrassed, and many of 'the stately homes of England'—often associated with legendary lore and the history of centuries—have to be handed over to the highest bidder. We are not here concerned with the political or economical aspect of this transference of landed property; but even the most utilitarian will admit that there is something melancholy in seeing a fine old historic mansion advertised for sale, or a family divorced from an estate with which it

may have been connected for generations. On the other hand, nothing, we should fancy, would be more tempting to the new class of rich men desirous of acquiring landed possessions than the chance of securing some old family seat, of quaint architectural design, and crowded with memories of the past. A splendid chance of this kind was offered some time ago in the proposed sale of Fyvie Castle, in Aberdeenshire, along with the adjoining estate; but no sale was effected. This castle may be said to be complete in its way. It possesses dungeons, a 'murder-hole,' and a secret, inaccessible chamber, with, of course, a dreadful threat hanging over the head of him who first enters it; a 'Green Lady' is said to occasionally walk up and down its main staircase; a 'dripping stone' is one of its curiosities; a family history is associated with each of its four towers; it figures prominently in a well-known local ballad; and Thomas the Rhymer even delivered himself of a prophecy concerning it. Yet, withal, it is a comfortable and commodious mansion, pleasantly situated, with park, lake, river, and shootings attached. What more could one wish for in a castle?

The traveller from Aberdeen to Banff by railway may catch a glimpse of Fyvie Castle to his right when he has accomplished about three-fourths of his journey. He will only see its turret-tops, however, for the castle stands in a well-wooded hollow—familiarily known in the Aberdeenshire dialect as 'the howe o' Fyvie'—encircled by low, undulating hills and stretches of highly cultivated land. The castle occupies two sides of a square, and is a high and narrow structure of the old Scotch baronial type, which would be designated plain were it not for its numerous turrets and dormer windows, surmounted with carved canopies and statuary. It has something of the appearance of a French chateau, and it has indeed been cited by John Hill Burton in his *Scot Abroad* as one of the finest specimens of how the chateau architecture of France was superimposed upon the original grim square block of a Scotch baronial mansion. The chief front is to the south, and is formed by the union of three tall towers, built by and called after three successive families who, at one time or other, have been owners of Fyvie. Of these three towers, the most noticeable is the central one, the Seton Tower, named after a member of the Seton family, to whose French upbringing and architectural tastes the general design of the building is attributed. It is curiously recessed, two semi-round twin towers being united by an arch above the fourth story. In the recess thus formed, which is rendered striking by its great height and width, is the former grand entrance, leading into a low, vaulted passage, the doorway being defended by a ponderous iron grating bolted into the massive walls. The west side, terminating in a corresponding tower at the north end, is of more modern construction, but is in perfect harmony with the front. The main architectural feature of the castle, however, is, as already hinted, its many hardiwan turrets and dormer windows and high-pitched gables, the turrets being surmounted with stone figures, and the dormer windows with carved canopies. A good view of this portion of the structure is given in Billings's *Baronial*

and Ecclesiastical Antiquities of Scotland, the castle being there described (again by Hill Burton, who furnished the letterpress to Billings's engravings) as 'one of the noblest and most beautiful specimens of the rich architecture which the Scottish barons of the days of King James VI. obtained from France. Its three princely towers, with their luxuriant coronet of coned turrets, sharp gables, tall roofs and chimneys, canopied dormer windows, and rude statuary, present a sky outline at once graceful, rich, and massive, and in these qualities exceeding even the far-famed Glamis.' The interior of the building is in keeping with the exterior, and abounds in narrow passages, winding staircases, and small rooms; though there are apartments the size and elegance of which could hardly be predicated from a mere survey of the outside of the castle. For such an old place, the light and airiness of the rooms are something remarkable; while the views across the park and policies that are obtained from the windows are charming and charmingly diversified. But the main attraction is a grand stone staircase of unique design, said to be without an equal, or even a rival, in Scotland. It is best described as 'revolving in corkscrew fashion round a massive central pillar, the skill of the architect being chiefly shown in the turns and windings of the ribbed and vaulted roof, with its arches springing occasionally out of carved capitals in the walls.' The steps are of great breadth, and are so gently graduated, that it is easy to accept a tradition to the effect that the horse of one of the lairds used to ascend them.

The stone figures on the tops of the turrets, wrought in the red sandstone that lends colour to the canopies and other ornamentations, are somewhat diminutive, and, with one exception, have lost their personality, if they ever had any. This exceptional figure is said to represent Andrew Lammie, 'the trumpeter of Fyvie,' immortalised in a well-known Aberdeenshire ballad, *Mill o' Tifty's Annie*. The miller's daughter fell in love with the trumpeter, and was done to death by her family in consequence, the tragedy being completed by the pining away of the trumpeter. We quote the concluding verses of this truly pathetic ballad:

'Fyvie lands lie braid and wide,
And oh, but they be bouny!
But I wadna gie my ain true-love,
For a' this lands in Fyvie!

'But mak my bed, and lay me down,
And turn my face to Fyvie,
That I may see, before I die,
My benny Andrew Lammie!

They made her bed, and laid her down,
And turned her face to Fyvie;
She gave a groan, and died or near—
She ne'er saw Andrew Lammie.

The laird o' Fyvie ho went hame,
And he was sad and sorry;
Says, 'The bonniest lass o' the country-side
Has died for Andrew Lammie.'

Oh, Andrew's gane to the house-top
O' the bonny house o' Fyvie;
He's blawn his horn baith loud and shrill
O'er the lowland lass o' Fyvie.

'Mony a time hae I walked a' night,
And never yet was wary;
But now I may walk wae my lano,
For I'll never see my dearie.

'Love pines away, love dwines away,
Love—love decays the body;
For the love o' thee, now I maun dee;
I come, my bonny Annie!'

Mill of Tifty is still 'to the fore,' and the effigy of the trumpeter points his trumpet in its direction; and the ballad seems to have some truth in it, for the tombstone of the unfortunate Annie—her real name was Agnes Smith—was till recently in Fyvie kirkyard, being now replaced by a handsome monument; and documents show that her father was owner of the mill in 1672.

The castle as it now stands—there is supposed to have been an older castle or keep—is believed to date from about 1397, the oldest tower extant having been built by Sir Henry Preston—of the family of Preston of Craigmillar—who fought at Otterburn, and who acquired the estate from Sir James de Lindsay, 'Domines de Crawford et Buchan.' From the Prestons, the estate passed by marriage into a family called Meldrum; but the family most associated with the castle is the family named after it. In 1596, Fyvie was purchased from the Meldrums by Alexander Seton, third son of George, sixth Lord Seton, and brother of the first Earl of Winton. This Alexander Seton was first created Lord Fyvie, and then Earl of Dunfermline—the former title being apparently used by the family in the north. He was a lawyer-statesman of great ability and influence, and a favorite councillor of James I.'s. He held a number of state and judicial offices, being successively President of the Court of Session and Lord Chancellor of Scotland; and he was the King's Commissioner to the Scotch parliament of 1612, which rescinded the Act of 1592 establishing the Presbyterian system of church government. The second Lord Fyvie took a prominent part, under Montrose, in the operations against the Covenanters, and afterwards lived abroad with Charles II., and shared in the honours distributed at the restoration of the Merry Monarch. The fourth and last peer fought at Killiecrankie on the royalist side, was outlawed, and died at St Germain. The estate, which had been forfeited to the Crown, was sold in 1726 to William, second Earl of Aberdeen, who settled it on his eldest son by his third wife, Lady Anne Gordon, sister of Lord Lewie Gordon—the 'Lewie Gordon' of the Jacobite ballad; and it has since descended through members of junior branches of the Gordon (Aberdeen) family. Its present proprietor is Sir Maurice Duff-Gordon, son of Lady Duff-Gordon, whose pleasant *Letters from Egypt* have not yet escaped memory.

It will thus be seen that a considerable historic interest attaches to the castle that was so recently in the market. The domain of Fyvie, indeed, is said to have been a royal chase at one time; and some would even have it that in the reign of Robert the Bruce it was a royal residence, and was visited in 1296 by Edward I. on his progress through the north of Scotland. There is a 'Queen Mary Room' in the castle, and some good specimens of the furniture of

Mary's period, though it is doubtful if Mary herself ever occupied the room. The great Marquis of Montrose, who certainly encamped once in the neighbourhood of the castle, is reported to have spent a night under its roof; and a century later, the Duke of Cumberland marched through the policies of Fyvie on his way to Culloden.

Turning from the historical to the legendary, we have a prophecy of Thomas the Rhymer's respecting Fyvie:

Fyvie riggs and towers,
Hapless shall your meadmaes be,
When ye shall hae within your methes,
Frae harryt kirk's land, stanes three—
Ane in Preston's tower;
Ane in my lady's bower;
And ane below the water-yett,
And it ye shall never get.

Two of these stones have been found in their respective places, but the third one remains true to the seer's prediction. One of the weird stones is carefully kept, and is known as the 'dripping stone,' as at times it exudes a large quantity of moisture, often sufficient to fill a large basin with water. Singular to say, nothing is known of a 'water-yett,' or of there having been one; while the alleged raid on Church property is equally a mystery; and though the hapless fate of the ladies of Fyvie is not specified, it is a curious circumstance that no heir has been born in Fyvie Castle for several generations. But whatever the prophecy may portend, it completes the charm of a castle which possesses much to delight both the lover of the picturesque and the worshipper of the past.

BIRD NOTES.

Six poplar trees, in golden green,
Stand up the sweet May snow between—
The snow of plum and pear tree bloom—
And I, looking down from my little room,
Call to the bird on the bough: 'What cheer?'
And he pipes for answer: 'The spring is here.'

A month goes by with its sun and rain,
And a rosebud taps at my window pane;
I see in the garden down below
The tall white lilies a stately row;
The birds are pecking the cherries red:
'Summer is sweet,' the starlings said.

Again I look from my casement down;
The leaves are changing to red and brown;
And overhead, through a sky of gray,
The swallows are flying far away.
'Whither away, sweet birds?' I cry.
'Autumn is come,' they make reply.

Keenly, coldly, the north winds blow;
Silently falls the pure white snow;
Of birds and blossoms am I bereft—
Brave bright robin alone is left,
And he taps and chirps at my window pane:
'Take heart; the spring will return again.'

CLAIMANTS TO ROYALTY.

SINCE the famous Tichborne trial brought 'The Claimant' so prominently before the reading public, the general use of a term which accurately described his position without seeming to prejudice his case has given it universal currency as a convenient designation in similar cases of disputed or doubtful identity. For instance, the newspapers have recently announced a 'Napoleonic Claimant,' who makes his appearance in the most unromantic manner, by presenting himself before a magistrate at a police station in Paris, and asking for money to pay his passage to England. He claimed to be the Prince Imperial, the legitimate son of the Emperor Napoleon III. and the Empress Eugénie. The announcement of his death in Zululand was a mistake: he was not killed, but captured by the Zulus. After some time, he effected his escape, and having traversed Africa from south to north, he crossed the Mediterranean and landed at Marseilles. His poverty and his dignity prevented him from presenting himself before his mother, and so he stayed and worked in Marseilles incognito for several years. But he met the Empress once: it was at Vienna, at the tomb of Maximilian. So violent was his emotion, that he swooned away. The Empress herself raised him and tended him; but when he became conscious, she had gone. He wished now to go to her, but he was penniless. Would the magistrate grant him the sum necessary; and his mother, the Empress, would repay the loan? When asked to show his papers, he produced a book in which was entered the name of Pollak, a journeyman clock-maker of Vienna. It had been lent to him to enable him to maintain his incognito.

When he found that his story was not to be credited, he acceded to the magistrate of yielding to pressure put upon him by the Princes Victor and Louis, whose interest it was to supplant the rightful heir. He spoke in the language of a well-educated man; and when examined with a

view to determine his mental condition, he betrayed no symptom of derangement.

The methods of all Claimants have a certain similarity, though some have been more audacious and successful than others. This is perhaps the most audacious of modern instances. But there are many examples of Claimants more or less notorious in the history of past times, whose pretensions are quite as difficult to reconcile with recorded facts. In most of these historical instances the Claimants have advanced pretensions to the name and station of a deceased member of some reigning family, and much obscurity has thus been thrown around historical events, whose incidental details have been confused and complicated by the conflicting statements of contemporary or nearly contemporary records.

Perhaps the least known, but not the least curious and tragical story of a Claimant is that of the woman who, in the first year of the fourteenth century, attempted to personate the Maid of Norway, heiress to the crown of Scotland, and presumptive heiress also to that of Norway.—It had been given out that the Maid of Norway had died on her voyage to Scotland; but that, it was now alleged, was a mistake; she did not die; but she was 'sold' or betrayed by those who had charge of her, and carried away to an obscure hiding-place on the continent. She had at last found means to escape, and coming from Lubeck to Bergen—tho' very same port from which she had sailed for Scotland ten years before—she there presented herself to the people of Norway as the Princess Margaréte. Although her father, King Eirik, was now dead, and her uncle Hakon possessed the throne, her right of succession to the crowns of Norway and of Scotland had been secured by the marriage contract of Norburgh, by which her father had espoused her mother Margaret, the daughter of Alexander III., king of Scotland. The Claimant appeared old for her years, and was white-haired; but sorrow brings gray hairs more surely than age. She was a married woman; and her husband came with her

to Norway, and subsequently shared her tragic fate. King Hakon himself was present at her trial in Bergen, of which, unfortunately, no record exists. But we learn from the *Iceland Annals* that she was hurned to death as an impostor at Nordness, and her husband beheaded. When she was being taken through the Kongsgaard Port to the place of execution, she said: 'I remember well when I, as a child, was taken through this self-same gate to be carried into Scotland; there was then in the Iligh Church of the Apostles an Iceland priest, Hafidi by name, who was chaplain to my father, King Eirik; and when the clergy ceased singing, Sir Hafidi began the hymn *Veni Creator*, and that hymn was sung out to the end, just as I was taken on board the ship.'

Hafidi Steinsson, the priest here mentioned, had long since gone back to Iceland, where he died parish priest of Breidabotstad; and in chronicling his death, the annalist adds that 'he was King Eirik's chaplain at the time that his daughter Margaret was taken to Scotland, as she herself afterwards bore witness when she was being carried to execution at Nordness.' Indeed, so prevalent was the belief in the personal identity of the Claimant with the daughter of King Eirik who died on the voyage to Orkney in 1290, that the place of her execution became a resort of pilgrims; and many of the priesthood having countenanced the popular belief in her martyrdom, a chapel was built on the spot where she suffered; and though uncanonised, and reproached by the dignitaries of the church, her memory was held in reverence till the Reformation as St Maritte (Margaret), the Martyr of Nordness. In 1320, the number of pilgrimages to this irregular shrine had become so numerous that Bishop Audfinn of Bergen issued an official interdict against them, an interference which was resented by his canons, some of whom were bold enough to protest against its promulgation.

Nothing is known of the Claimant's previous history, except that the contemporary annalist states that she came to Bergen in a ship from Lübeck. Absolon Pedersen asserts that she came from Scotland, but gives no authority for the statement, and there is sufficient evidence in the records to render this highly improbable. But it is a very remarkable circumstance that Wyntoun, the popular historian of his time, gave credence in Scotland to the statement—which we must assume to have been that the popular belief—that the Maid of Norway was put to death in her own country by martyrdom. After giving circumstantial details of the sending of the Scottish embassy to Norway, consisting of Sir David of the Wemyss and Michael Scot of Balwearie, he adds, that when they arrived—

And appeared till have been
By the law of Norway Queen;
But that Maiden sweet for-thi [therefore]
Was put to death by martyrty.

In accordance with the usage of the period, the expression of the chronicler describing the manner of her death would be universally understood to mean burning at the stake; and the evident anachronism, as well as the inherent improbability of the narrative, is accounted for by the fact that it quite accurately describes the death of the Claimant, but assigns it to the time of the death of the Princess. The reason given by Wyntoun for the 'martyrdom' is, that the Norwegians—though their law allowed—could not brook the idea of a woman succeeding to the crown; and this also may be accounted for by the fact that the woman who suffered was a pretender to the crown.

No incident in Scottish history is more pathetic than that of the untimely death of the young Princess on her voyage to Orkney; and no single event in the whole course of that history has exercised a more important influence on the destinies of the nation. In these circumstances, we cannot cease to wonder how it came to pass that there is no authentic record of its details in the contemporary or nearly contemporary chronicles of Scottish or Norwegian history. The only contemporary document in Scottish record which notices her death is the letter of the Bishop of St Andrews to Edward I., dated at Leuchars the 7th of October 1290, in which the bishop states that there was a rumour of her death; but that he had heard subsequently that she 'had recovered of her sickness, but was still weak.' It was plain, however, that the bishop did not believe the rumour of her recovery, for he concludes his letter by praying King Edward to approach the Borders with his army to prevent bloodshed, seeing that Sir Robert Bruce had come to Perth and Mar and Athole were collecting their forces. On the Norwegian side, there is a total absence of authentic contemporary record of the time and manner of the death of the Princess; and there would have been absolutely nothing known of the details of her decease, if it had not been for the appearance ten years later of the Claimant, whom Munch, the historian of Norway, following Bishop Audfinn, has no hesitation in designating 'The False Margaret.'

In his official interdict of 1320, forbidding the people 'any longer to invoke that woman with great vows and worship as if she had been one of God's martyrs,' the bishop states that he has deemed it his duty to declare the truth as to her case: 'She said, indeed, that she was the child and lawful heir of King Eirik; but when she came from Lübeck to Bergen she was gray-haired and white in the head, and was proved to be twenty years older than the time of King Eirik's marriage with Margaret of Scotland. He was then only thirteen winters old, and consequently, could not have been the father of a person of her years. And then he had no other

Dead then was that Maiden fair,
That of law suld have been heir,

child than one daughter by Queen Margaret. This only child of King Eirik and Queen Margaret was on her journey to Scotland, when she died in Orkney between the hands of Bishop Narve of Bergen, and in the presence of the best men of the land, who had attended her from Norway; and the bishop and Herr Thore Hakonson and others brought back her corpse to Bergen, where her father had the coffin opened and narrowly examined the body, and himself acknowledged that it was his daughter's corpse, and buried her beside the queen her mother, in the stone wall on the north side of the choir of the cathedral church of Bergen.

Although we owe these details of the Princess's death and burial, meagre as they are, to the bishop's anxiety to confute the pretensions of the Claimant, there can be no room for doubt as to their strict truth. And yet it was possible, ten years after the event, for a Claimant so to influence the popular belief, that, although burned to death as a traitorous impostor, she was regarded by many of the priesthood as a martyr; and by the common people was not only worshipped as a saint in the church erected to her memory on the spot where she suffered, but celebrated in songs which long continued to be handed down among them. Even to this day, the precise date of the death of the Princess Margaret remains unknown; and until quite recently, it was generally believed that she had been buried in Kirkwall Cathedral, as is indeed stated by the Danish archaeologist Worsaae in his account of that edifice given in his work on *The Danes and Northmen in England*. No *History of Scotland*, until the issue of the last edition of Dr John Hill Burton's, has noticed the curious episode of the False Margaret, a knowledge of which is necessary in order to account for the fact that, in Wyclif's time, it was the popular belief in Scotland that the Maid of Norway had suffered martyrdom at the hands of her own countrymen.

It is curious that in connection with the history of Scotland, and before the close of the fourteenth century, we find the story of another Claimant not less audacious in his pretensions, but much more fortunate in his patrons, by whom he was maintained till his death as a state pensioner, and buried in one of the churches of Stirling under the royal name and regal title to which he had laid claim. There was this strange element in his case that he was the second personator of the same dead king. Readers of English history are familiar with the incidents of the revolution which placed Henry of Lancaster on the throne, and consigned 'the good King Richard' to a perpetual prison in Pontefract Castle. But the subsequent events in the life of the imprisoned monarch, and the date and manner of his death, are shrouded in an impenetrable obscurity. One of the ablest of our Scottish historians, Patrick Fraser Tytler, has even declared, after an elaborate investigation of the whole available evidence, that this second Claimant, whose story we are about to notice, was Richard II. in reality.

It is well known that shortly after the king's imprisonment, there was a conspiracy to replace him on the throne. The conspirators attempted to attract the people to their cause by spreading

abroad the rumour of his escape from Pontefract; and, as is stated by a contemporary chronicler, 'to make this the more credible, they brought into the field with them a chaplain called Father Maudelain, who so exactly resembled good King Richard in face and person, in form and speech, that every one who saw him declared that he was their former king.' The conspiracy failed; and those most deeply concerned in it, among whom was the first personator, Father Maudelain, were beheaded.

Shortly afterwards, it was given out that King Richard had died in Pontefract Castle, on or about the 14th of February 1399. Rumour, indeed, spoke freely of the suspicion, that if he were dead, he had surely been murdered by his enemies, and with the connivance of the reigning king. It was not till nearly a month after the alleged date of his death that, in order to silence the popular rumours, King Henry caused the body to be brought publicly to London 'with the face exposed,' and laid in state for two days in the church of St Paul, 'that the people might believe for certain that he was dead.' But, says the old chronicler formerly quoted, 'I certainly do not believe that it was the king, but I think it was Maudelain, his chaplain,' who had been beheaded little more than a month previously.

There were many who shared this unbelief; and in 1402, the rumours that King Richard was yet alive became so persistent and circumstantial, that King Henry dealt with them by putting to death a number of persons, principally priests and friars, for spreading such treasonable reports. The cause of the revival of these rumours at this time is revealed in a document issued by King Henry, requiring the sheriffs to arrest all persons guilty of spreading the report that King Richard was alive, which had arisen from a person calling himself King Richard having appeared in Scotland in company with one William Serle, who had been groom of the robes to Richard, and had possessed himself of his signet.

As the scene thus shifts to Scotland, we naturally turn to the Scottish chronicles and records for the further elucidation of the mystery. Wyclif and Bower—each writing of events which happened within his own lifetime—narrate the story of this second Claimant in much the same manner. He came from the out-lesles of Scotland, having been discovered in the kitchen of Donald, Lord of the Isles, by persons who had seen King Richard, and recognised his likeness. He was sent in charge of Lord Montgomery to Robert III. of Scotland, by whom he was well received, and assigned a pension of one hundred marks yearly. After King Robert's death, the pension was continued by the Regent Albany. The Scottish Chamberlain, in clearing his accounts with these annual payments, has entered them as paid to 'King Richard of England.' Finally, we learn from an old Scottish chronicle that when he died at Stirling in 1419, his body was buried on the north side of the high-altar of the Church of the Preaching Friars, and a long Latin epitaph graven over his tomb informed the reader that 'Here lies buried King Richard of England.' Yet it has been established as clearly as any such question can now be established by evidence, that this second personator of King

Richard was an adventurer named Thomas Ward, or Thomas of Trumpington, who, with his confederate William Serle, is exempted by name from the general amnesty granted to political offenders by Henry IV. in 1403.

IN ALL SHADES.

CHAPTER XXVIII.

MEANWHILE, Harry Noel himself was quite unconsciously riding round to the Hawthorns' cottage, to perform the whole social duty of man by Edward and Marian.

'So you've come out to look after your father's estates in Barbadoes, have you, Mr Noel?' Marian inquired with a quiet smile, after the first greetings and talk about the voyage were well over.

Harry laughed. 'Well, Mrs Hawthorn,' he said confidentially, 'my father's estates there seem to have looked after themselves pretty comfortably for the last twenty years, or at least been looked after vicariously by a rascally local Scotch agent; and I've no doubt they'd have continued to look after themselves for the next twenty years without my intervention, if nothing particular had occurred otherwise to bring me out here.'

'But something particular did occur—eh, Mr Noel?'

'No, nothing occurred,' Harry Noel answered, with a distinct stress upon the significant verb. 'But I had reasons of my own which made me anxious to visit Trinidad; and I thought Barbadoes would be an excellent excuse to supply to Sir Walter for the expenses of the journey. The old gentleman jumped at it—positively jumped at it. There's nothing loosens Sir Walter's pursestrings like a devotion to business; and he declared to me on leaving, with tears in his eyes almost, that it was the first time he ever remembered to have seen me show any proper interest whatsoever in the family property.'

'And what were the reasons that made you so very anxious, then, to visit Trinidad?'

'Why, Mrs Hawthorn, how can you ask me? Wasn't I naturally desirous of seeing you and Edward once more after a year's absence?'

Marian coughed a little dry cough. 'Friendship is a very powerfully attractive magnet, isn't it, Edward?' she said with an arch smile to her husband. 'It was very good of Mr Noel to have thought of coming four thousand miles across the Atlantic just to visit you and me, dear—now, wasn't it?'

'So very good,' Edward answered, laughing, 'that I should almost be inclined myself (as a lawyer) to suspect some other underlying motive.'

'Well, she is a very dear little girl,' Marian went on reflectively.

'She is, certainly,' her husband echoed.

Harry laughed. 'I see you've found me out,' he answered, not altogether displeased. 'Well, yes, I may as well make a clean breast of it, Mrs Hawthorn. I've come across on purpose to ask her; and I won't go back either, till I can take her with me. I've waited for twelve months,

to make quite sure I knew my own heart and wasn't mistaken about it. Every day, her image has remained there clearer and clearer than before, and I *will* win her, or else stop here for ever.'

'When a man says that and really means it,' Marian replied encouragingly, 'I believe in the end he can always win the girl he has set his heart upon.'

'But I suppose you know,' Edward interrupted, 'that her father has already made up his mind that she's to marry a cousin of hers at Pimento Valley, a planter in the island, and has announced the fact publicly to half Trinidad?'

'Not Mr Tom Dupuy?' Harry cried in amazement.

'Yes, Tom Dupuy—the very man. Then you've met him already?'

'He lunched with us to-day at Orange Grove!'

Harry answered, puckering his brow a little. 'And her father actually wants her to marry that fellow! By Jove, what a desecration!'

'Then you don't like what you've even so far of Mr Tom?'

Marian asked with a smile. Harry rose and leaned against the piazza pillar with his hands behind him. 'The man's a cad,' he answered briefly.

'If we were in Piccadilly again,' Edward Hawthorn said quietly, 'I should say that was probably a piece of pure class prejudice, Noel; but as we are in Trinidad, and as I happen to know Mr Tom Dupuy by two or three pieces of personal adventure, I don't mind telling you in strict confidence, I cordially agree with you.'

'Ah!' Harry Noel cried with much amusement, clapping him heartily on his broad shoulder. 'So coming to Trinidad has knocked some of that radical humbug and nonsense clean out of you, has it, Teddy? I knew it would, my dear fellow; I knew you'd get rid of it!'

'On the contrary, Mr Noel,' Marian answered with quiet dignity, 'I think it has really made us a great deal more confirmed in our own opinions than we were to begin with. We have suffered a great deal ourselves, you know, since we came to Trinidad.'

Harry flushed in the face a little. 'You needn't tell me all about it, Mrs Hawthorn,' he said uneasily. 'I've heard something about the matter already from the two Dupuys, and all I can say is, I never heard before such a foolish, ridiculous, nonsensical, cock-and-hull prejudice as the one they told me about, in the whole course of my precious existence. If it hadn't been for Nora's sake—I mean for Miss Dupuy's—and he checked himself suddenly—upon my word, I really think I should have knocked the fellow down in his uncle's dining-room the very first moment he began to speak about it.'

'Mr Noel,' Marian said, 'I know how absurd it must seem to you, but you can't imagine how much Edward and I have suffered about it since we've been in this island.'

'I can,' Harry answered. 'I can understand it easily. I had a specimen of it myself from those fellows at lunch this morning. I kept as calm as I could outwardly; but, by Jove, Mrs Hawthorn, it made my blood boil over within me to hear the way they spoke of your

husband.—Upon my honour, if it weren't for—
for Miss Dupuy,' he added thoughtfully, 'I
wouldn't stop now a single night to except
that man's hospitality after the way he spoke
about her.'

'No, no; do stop,' Marlen answered simply.
'We went you so much to marry Nora; and we
went to save her from that horrid man her
father has chosen for her.'

And then they began unburdening their hearts
to Harry Noel with the long arrears of twelve
months' continuous confidences. It was such a
relief to get a little fresh external sympathy,
to be able to talk about it all to somebody just
come from England, and entirely free from the
taint of West Indian prejudice. They told
Harry everything, without reserve; and Harry
listened, growing more and more indignant
every minute, to the long story of petty slights
and undeserved insults. At last he could restrain
his wrath no longer. 'It's preposterous,' he
cried, walking up and down the piazza angrily,
by way of giving vent to his suppressed emotion;
'it's abominable! it's outrageous! it's not to
be borne with! The idea of these people, these
hole-and-corner nobodies, these miserable, stupid,
ignorant noodles, with no more education or
manners than an English ploughboy—O yes, my
dear fellow, I know what they are—I've seen
them in Barbadoes—setting themselves up to be
better than you are—there, upon my word I've
really no patience with it. I shall flog some
of them soundly, some day, before I've done
with them; I know I shall. I can't avoid it.
But what on earth can have induced you to stop
here, my dear Teddy, when you might have
gone back again comfortably to England, and
have mixed properly in the sort of society you're
naturally fitted for?'

'I did,' Marian answered firmly; 'I induced
him, Mr Noel. I wouldn't let him run away
from these miserable people. And besides, you
know, he's been able to do such a lot of good
here. All the negroes love him dearly, because
he's protected them from so much injustice.
He's the most popular man in the island with
the black people; he's been so good to them,
and so useful to them, and such a help against
the planters, who are always trying their hardest
to oppress them. And isn't that something worth
staying for, in spite of everything?'

Harry Noel paused and hesitated. 'Tastes
differ, Mrs Hawthorn,' he answered more soberly.
'For my part, I can't say I feel myself very
profoundly interested in the eternal nigger ques-
tion; though, if a man feels it's his duty to
stop and see the thing out to the bitter end,
why, of course he ought in that case to stop
and see it. But what does rile me is the idea
that these wretched Dupuy people should ven-
ture to talk in the way they do about such a
man as your husband—confound them!'

Tea interrupted his flow of indignation.

But when Harry Noel had ridden away again
towards Orange Grove on Mr Dupuy's pony,
Hawthorn and his wife stood looking at one
another in dubious silence for a few minutes.
Neither of them liked to utter the thought
that had been uppermost in both their minds
from the first moment they saw him in Trinidad.

At last Edward broke the ominous stillness.

'Harry Noel's awfully dark, isn't he, Marian?'
he said uneasily.

'Very,' Marian answered in as unconcerned
a voice as she could well summon up. 'And
so extremely handsome, too, Edward,' she added
after a moment's faint pause, as if to turn the
current of the conversation.

Neither of them had ever observed in England
how exceedingly olive-coloured Harry Noel's com-
plexion really was—in England, to be as dark
as a gipsy is of no importance; but now in
Trinidad, girt round by all that curiously sus-
picious and genealogically inquiring society, they
couldn't help noticing to themselves what a very
dark skin and what curly hair he happened to
have inherited.

'And his mother's a Barbadian lady,' Edward
went on uncomfortably, pretending to play with
a book and a paper-knife.

'She is,' Marian answered, hardly daring to
look up at her husband's face in her natural
confusion. 'He—be always seems so very fond
of his mother, Edward, darling.'

Edward went on cutting the pages of his
newly-arrived magazine in grim silence for a
few minutes longer; then he said: 'I wish to
goodness he could get engaged and married
offhand to Nora Dupuy very soon, Marian, and
then clear out at once and for ever from this
detestable island as quickly as possible.'

'It would be better if he could, perhaps,'
Marian answered, sighing deeply. 'Poor dear
Nora! I wish she'd take him. She could never
be happy with that horrid Dupuy man.'

They didn't dare to speak, one to the other,
the doubt that was agitating them; but they
both agreed in that half-unspoken fashion that
it would be well if Harry pressed his suit soon,
before any sudden thunderbolt had time to fall
unexpectedly upon his head and mar his chance
with poor little Nora.

As Harry Noel rode back to Orange Grove
alone, along the level bridle-path, he chanced
to drop his short riding-whip at a turn of the
road by a broad canopce. A tall negro was
booming vigorously among the luxuriant row of
cane close by. The young Englishman called
out to him carelessly, as he would have done
to a labourer at home: 'Here you, hi, sir, come
and pick up my whip, will you!'

The tall negro turned and stared at him.
'Who you callin' to come an' pick up your
whip, me fren?' he answered somewhat sav-
agely.

Noel glanced back at the man with an angry
glare. 'You!' he said, pointing with an imperi-
ous gesture to the whip on the ground. 'I
called you to pick it up for me. Don't you
understand English?'

'You is rude gentleman for true,' the old negro
responded quietly, continuing his task of hoeing
in the canopce, without any attempt to pick
up the whip for the unrecognised stranger. 'If
you want de whip picked up, what for you
don't speak to naygur decently? Ole-time folk
has proverb, "Please am a good dog, an' him
keep don't cost nuffin." Get down yourself,
sah, an' pick up your own whip for you-self if
you want him.'

Harry was just on the point of dismounting
and following the old negro's advice, with some

remote idea of applying the whip immediately to the back of his adviser, when a younger black man, stepping out hastily from behind a row of cones that had hitherto concealed him, took up the whip and handed it back to him with a respectful salutation. The old man looked on disdainfully while Harry took it; then, as the rider went on with a parting angry glance, he muttered sulkily: 'Who dat man dat you gib de whip to? An' what for you want to gib it him dere, Peter?'

The younger man answered apologetically: 'Det Mr Noel, buckra from Englan'; him come to stop et Orange Grobe along ob de massa.'

'Buckra from Englan'! Louis Delgado cried incredulously. 'Him don't no buckra from Englan', I tellin' you, me brudder; him Trinidad brown man as sure as de gospel. You don't see him is brown men, Peter, de minnit you look at him?'

Peter shook his head and grinned solemnly. 'No, Mistah Delgado, him don't no brown man,' he answered, laughing. 'Him is dark for true, but still him real buckra. Him stoppiu' up at house elong ob de massa!'

Delgado turned to his work once more, doggedly. 'If him buckra, an' if him stoppin' up wit dem Dupny,' he said half aloud, but so that the wondering Peter could easily overhear it, 'when de great an' terrible day come, he will be cut off wit all de household. An' de day don't gwine to be delayed long now, neider.' A mumbled Arabic sentence, which Peter of course could not understand, gave point and terror to this last prediction. Peter turned away, thinking to himself that Louis Delgado was a terrible obeah man and sorcerer for certain, and that whoever crossed his path, had better think twice before he offended so powerful an antagonist.

Meanwhile, Harry Noel was still riding on to Orange Grove. As he reached the garden gate, Tom Dupny met him, out for a walk in the cool of the evening with big Slot, his great Cuban bloodhound. As Harry drew near, Slot burst away suddenly with a leap from his master, and before Harry could foresee what was going to happen, the huge brute had sprung up at him fiercely, and was attacking him with his mighty teeth and paws, as though about to drag him from his seat forcibly with his slobbering canines. Harry hit out at the beast a vicious blow from the butt-end of his riding-whip, and at the same moment Tom Dupny, sauntering up somewhat more lazily than politeness or even common humanity perhaps demanded, caught the dog steadily by the neck and held him back by main force, still struggling vehemently and pulling at the collar. His great slobbering jaws opened hungrily towards the angry Englishman, and his eyes gleamed with the fierce light of a starving carnivore in sight and smell of his natural prey.

'Precious vicious dog you keep, Mr Dupny,' Harry exclaimed, not over good-humouredly, for the brute had made its teeth meet through the flap of his coat lap-pets: 'you oughtn't to let him go at large, I fancy.'

Tom Dupny stooped and patted his huge favorite lovingly on the head with very little hypocritical show of penitence or apology. 'He don't

often go off this way,' he answered coolly. 'He's a Cuban bloodhound, Slot is; pure-blooded—the same kind we used to train in the good old days to hunt up the runaway niggers; and they often go at a black man or a brown man—that's what they're meant for. The moment they smell African blood, they're after it, like a greyhound after a hare, as quick as lightning. But I never knew Slot before go for a white man! It's very singular—excessively singular. I never before knew him go for a real white man.'

'If he was my dog,' Harry Noel answered, walking his pony up to the door with a sharp lookout on the ugly mouth of the straining and quivering bloodhound, 'he'd never have this chance again, I can tell you, to go for another. The brute's most dangerous—a most bloodthirsty creature. And indeed, I'm not sentimental myself on the matter of niggers; but I don't know that in a country where there are so many niggers knocking about (usually everywhere, any man has got a right to keep a dog that darts straight at them as a greyhound darts at a hare, according to your own confession. It doesn't seem to me exactly right or proper somehow.'

Tom Dupny glanced carelessly at the struggling brute and answered with a coarse laugh: 'I see, Mr Noel, you've been taking counsel already with your friend Hawthorn. Well, well, in my opinion, I expect there's just about a pair of you!'

(To be continued.)

TOBACCO CULTIVATION.

THE question of the cultivation of tobacco has recently been brought within the range of practical agriculture. In both Houses of Parliament the government has announced that permission will be given to grow this plant, and cure it in proper manner, as experiments, in various parts of the country, and more especially in Ireland. The Council of the Royal Agricultural Society of England, with His Royal Highness the Prince of Wales in the chair, determined to help the government in the matter, provided the government gave a grant towards the experiments. The subject thus becomes one of special moment. It is very doubtful, however, whether any experiments that can be made will give us much more information than we at present have regarding this crop. That it can be grown in this country is certain. To take up the first seed catalogue that comes to our hand—that of Messrs Carter & Co.—we find that for a long series of years past, the seed of no fewer than seven varieties of *Nicotiana* is announced as for sale. The plants are grown in many gardens, and the leaves are dried and used as fumigants against insects. In fact, so simple is the growth of the plant, that the only directions given are to 'Sow on heat, and transplant to good, rich, loamy soil, or sow out of doors in May.' That the plant can be grown is certain; but if grown on an agricultural scale, it will have to bear with the usual effects of climate, injurious insects, and the thousand-and-ones ills which plant-life is heir to. That is, so far as the plant is concerned. The great difficulty in every country will begin with the curing, and

is the cause of the tobacco crop being gradually given up.

So far as Europe is concerned, there has been a great decrease in tobacco cultivation during recent years. In the Netherlands, the acreage is at present something like half what it was ten or twelve years ago. In Belgium, the decrease in area has been considerable, but not to so great an extent. In Austro-Hungary the acreage under tobacco was in 1884 less by 8768 acres than two years previously. In Germany, the area of the crop fell from 1881 to 1883 by over 12,000 acres. Italy, with its magnificent climate, grows only 8202 acres; while in France, where the government purchase the crop, only 32,800 acres were grown last year. It is to America, however, that we must turn for our best information as to the growth of tobacco. In the last four census years, this crop was grown to the following extent: 1850, crop of 199,752,655 pounds; 1860, crop of 434,209,461 pounds; 1870, 262,735,341 pounds; and 1880, crop of 472,661,117 pounds, grown on 638,841 acres. Here we find that although there was a great decrease in the growth of this crop after the war, it gradually picked up again, and the crop is now as large as ever. In 1883, 451,545,641 pounds were grown on an area of 638,739 acres. Its total value was £8,091,072.

The method of cultivation adopted in the United States cannot fail to be of use to the English or Irish grower. In the first place, a word should be said upon the position of tobacco in crop rotations. Travellers in South America have often noticed the desolate appearance of some portions of the country. This is due to the exhaustion of the soil by continuous tobacco-growing. A very large proportion of what was known as tobacco land has thus been reduced to a condition of poverty, and has been left to itself, and is covered with weeds. A good authority declares that this fault can be easily remedied, and that by growing tobacco as a rotation crop. After two crops of tobacco have been taken from the land, and after this a crop of corn, and then a crop of clover or vetches, after the latter have been cut or fed off, the land may be again prepared for another crop of tobacco. A word may be said here also on manures. In the best tobacco plantations, two hundred pounds of nitrate of soda and two hundred and fifty pounds of superphosphate per acre are used—the former bringing up a heavier crop, and the latter improving its quality. Besides these, large applications of farmyard manure are made. Taking Wisconsin as the State more particularly to be treated of, we find that the seed-beds are burned lightly, and a liberal allowance of manure worked in, to the depth of six inches, with a hoe or spade. This work of preparation begins in July, when the manure is applied. The bed is reworked in August, and again in September, for the purpose of keeping down any weeds or grass that may spring up; and finally, in November, it is hoed and raked and prepared to receive the seed, which is either sown in the Fall or early in the succeeding spring. When sown in the Fall, the seed is not previously sponged. After sowing, the bed is compacted by rolling, tramping, or clapping with a board. The plants are carefully nursed

by liquid manuring and by weeding. The young plants are generally large enough for transplanting by the 1st of June.

The land for the main crop—that is, into which the plants are transplanted from the seed-bed—is ploughed in the Fall after the crop of the previous year, and twice in the spring—in May, and just before the 1st of June. Coarse and rough manures are applied with the autumn ploughing, and finer well-rotted sorts in May. After the last ploughing, the land is thoroughly pulverised by harrows or drags, and marked off for the plant. The varieties of tobacco grown are either the seed-leaf or the Spanish. If the former, the plants are placed two and a half feet by three feet apart; but if the latter, three feet by a foot and a half. Thus, if the seed-leaf variety, some five thousand five hundred plants are used to the acre; and if the Spanish, nine thousand six hundred. As soon as the soil is in proper condition to work after the plants have been set out, a cultivator with five teeth is run between the rows, and this is kept up once or twice a week, until the field has been gone over five or six times. The crop is hoed twice—once after the cultivator has been run through the first time. Very little earth is put round the plant, level cultivation being preferred. In some portions of the district, a horse-hoe is used in cultivating the crop; this implement, from its peculiar construction, enables the operator to go very near each plant and stir every portion of the soil. In very small patches, the cultivation is done entirely with the hoe, which is kept up every week until the plants are so large that they cannot be worked without breaking the leaves.

The next operations are termed 'topping' and 'suckering.' In about forty-eight or fifty days after the plants are set, if the crop has been well cultivated and the weather seasonable, the flower-buds make their appearance, and are pinched out, leaving from fourteen to sixteen leaves on each plant. None of the bottom leaves are taken off, but all are left to mature, or dry up, serving as a protection against the dirt. Fields, however, are often seen in full blossom before the tobacco is topped, and this results in great damage to the crop. Tobacco is suckered twice—once in about a week after it is topped, and again just before it is cut, which is generally about two weeks after topping. 'Suckering' consists in the removal of young suckers, which at this time make their appearance in large numbers. As has been noted, tobacco is generally ready for harvesting in two weeks after being topped; but there is considerable variation in the time on various soils. On warm sandy loams, the plant will be as ripe in twelve days as it will be on heavy clayey soils in eighteen days. This is one of the reasons why sandy loams are preferred.

Harvesting commences early in August, and continues without intermission until September. The time preferred for cutting is from two o'clock in the afternoon until nearly sundown, because at that time tobacco is less liable to be blistered by the heat of the sun. The instrument used for cutting is a hatchet, the plants being cut off nearly on a level with the ground, and laid back on the rows to 'wilt.' After wilting, they are speared on laths. Of the large seed-leaf variety,

only about six plants are put on a lath, but of the smaller Spanish (or Havana) variety, ten are not considered too many. After being speared on the laths, the latter are carefully put on a long wagon-frame, made for the purpose, and carried to the sheds, where they are arranged on the tier poles or racks, from six to ten inches apart, according to the size of the plant, but never so close as to permit them to touch each other. It requires six weeks to cure the Spanish variety perfectly, and two months to cure the seed-leaf. If the weather is dry, after the crop is out, the doors are kept closed during the day and opened at night; but extreme care must be taken not to cure too rapidly. In muggy, sultry weather, as much air as possible should be given, thorough ventilation being indispensable, to prevent 'pole-sweat.' Continuous damp weather and continuous dry weather are both to be feared. It is believed by many good growers that white veins are the result of a drought after the tobacco has been harvested, and it is said that no crop cured when there is plenty of rain is ever affected with them. Inferences of this kind, however, are too often drawn without considering a sufficient number of cases to warrant the enunciation of a general law. This is the view put forth by Mr Killebrew, in an able paper on Tobacco-culture written for the American government. He, however, further points out that it is a well-established truth, deduced from the universal experience of the cultivation of seed-leaf tobacco in every State, that a crop cannot be cured without the alternations of moist and dry atmospheres.

A few words may be said on the curing of tobacco generally. Three systems are adopted in the United States. It may be (1) air-dried; (2) dried by open-fire heat from charcoal or wood fires in the barn; or (3) by flues which convey heat from ovens and heaters built outside the barn. The last method is said to be the best, as a better control can be had over the temperature. No regular rule can be given, as the heat must be regulated according to circumstances, and must change with the weather. The main thing is to dry the tobacco gradually to secure a good colour, and to prevent mould. When the tobacco is dry, it must be kept so by gentle fires in wet or damp weather, and it is not touched for the purpose of 'bulking' until it has become soft and pliable. Artificial sweating is believed by some to be accompanied with less risk than sweating by the natural process; and second stories of warehouses are sometimes prepared as sweating chambers by being closely sealed or 'plastered.' These are heated by furnaces, and the temperature maintained at from one hundred and ten to one hundred and forty degrees.

After curing, the tobacco is prepared for market. This consists of stripping the leaves from the stalks, tying them up in large bundles, and afterwards sorting them. After being sorted in 'grades,' these are tied up in 'hands' of from eighteen to twenty leaves, securely wrapped with a leaf at the butt-end, and 'bulked' in piles, with the heads out and the tails overlapping in the centre of the bulk. Here it remains until the 'fatty stems' are thoroughly cured, when it is sold to the dealers. These latter pack it in

barrels and sweat the leaves still further; but into this subject we need not go, as it can have but little interest to the farmer who intends growing tobacco in this country.

So far as the cost of growing tobacco is concerned, a large and successful grower in Pennsylvania, some two years ago, published the following statement of cost and returns from a field of nine and a half acres: 215½ days' labour of men from preparing the seed-bed up to the hanging in the barn, £43; team-work, 38½ days, with feed for 42½ days, £30; curing, stripping, and marketing, £15: total, £88. The net receipts were £174; thus showing a profit of £86. This was in a fairly good year.

These few notes show us that tobacco is a crop requiring a great expenditure of labour and care, and that even in America the profits of thirty pounds per acre, about which we have heard so much, are not always realised. This probability, however, are so much against our getting really fine qualities of tobacco, that it is doubtful if this necessary capital will be put into the business.

'WHERE IGNORANCE IS BLISS.'

I WRITE these pages as a warning. I don't suppose any one will profit by it. From the time of Cassandra downwards, nobody has ever paid attention to warnings. But that is not my affair.

A London newspaper, some years ago, gave up several columns of its valuable space to the question: 'What shall we do with our boys?' I perused the correspondence with a strong personal interest, for I myself am the proprietor of a boy—several boys, in point of fact; but I refer more particularly to my eldest, aged nineteen, as to whom I felt that it was time something was settled. I have a great belief—partly derived from the before-mentioned correspondence, and partly from my own observation—in studying a boy's natural bent, and finding him an occupation in accordance with it. Such being the case, I began to study Augustus with a view to finding out his special aptitude; but, unless a really remarkable faculty of outgrowing his trousers may be so regarded, I could not for some time discover that he had any. By dint, however, of careful observation and cross-examination of the household, I elicited that he was addicted to making extremely offensive smells in the back kitchen with chemicals, and that he had what he called a 'collection' of beetles and other unpleasant insects stuck on pins in a box in his bedroom. It appeared, therefore, that his proclivities were scientific, and I ultimately decided to make an analyst of him. Accordingly, after disposing of sundry painful but presumably necessary arrangements as to premium, Augustus was duly articulated to a Public Analyst. I miss capital letters, because I observed that Mr Scrutin himself always did so. Why, I cannot say. Possibly, a public analyst—without capitals—would not command the same amount of public confidence. On consideration, I don't suppose he would.

Augustus' first demand on taking up his new

occupation was a microscope. 'And while you're about it,' he suggested, 'it had better be a good one.' At first, I was inclined to suspect that this was an artful device for the further indulgence of his entomological vices, and that the implement would be devoted to post-mortem examinations of deceased caterpillars or other kindred abominations. He assured me, however, that such was not the case, and that the microscope was nowadays 'the very sheet-anchor of analytical science.' The 'sheet-anchor' completely took the wind out of my sails. (I feel that there is rather a confusion of metaphor here, but, not being a nautical person, I don't feel competent to set it right.) I surrendered, humbly remarking that I supposed a five-pound note would cover it. The youthful analyst laughed me to scorn. The very least, he assured me, that a good working microscope could be got for would be ten or twelve pounds. Ultimately, I agreed to purchase one at ten guineas, and congratulated myself that at anyrate *that* was done with. On the contrary, it was only just begun. No sooner had my analyst secured his microscope, than he began to insist upon the purchase of a number of auxiliary appliances, which, it appeared, no respectable microscope would be seen without. He broke them to me by degrees. At first he only mentioned, if I remember right, an 'achromatic condenser,' at two guineas. Next came a 'double nospiece' (why 'double,' I don't know); then a polarising apparatus and a camera lucida (four pounds ten); then a micrometer and a microtome (three guineas more); then somebody's prism, at one pound five; and somebody else's microspectroscope, at I don't know how much. Here, however, I put my foot down. I am compelled to regard the sordid consideration of price, though science doesn't.

The microscope and its subsidiary apparatus were duly delivered; but my analyst appeared to be in no particular hurry to convey them to the laboratory where he was studying. On my making a remark to this effect, he replied: 'Haven't taken them to the laboratory? No; and I'm not going to. Mr Scrutin has got a precious sight better microscope than mine—cost sixty guineas without the little extra articles, and they were about thirty more. He's got a microspectroscope, if you like!'

I refrained from arguing the point, and mildly remarked that in that case he might have used Mr Scrutin's microscope, and saved me some twenty guineas. But he rejected the idea with scorn, and explained that *his* microscope was not for laboratory use, but for 'private study.'

So far as my observation went, my analyst's private study had hitherto been confined to a short pipe and the last number of some penny dreadful; but I did not think it wise to check his new-born ardour; I contented myself by observing that I only hoped he would 'stick to it.'

'No fear of that,' he rejoined, as indignantly as a limpet might have done in answer to the same observation. 'Why, microscopy is the most fascinating study out.—Just take a squint at that, now.'

I looked down the tube, but couldn't see anything at all, and made a remark to that effect.

'Oh, that's because you haven't got the focus. —Now, try again.'

I tried again, and saw a sort of network of red fibre.

'I'll bet sixpence you can't tell me what *that* is!' he exclaimed triumphantly.

I owned the soft impeachment.

'That's the maxillary gland of a rat.'

'Dear me!' I said.

'Yes. Isn't it lovely? Here's another.—Now, just look at that.' (A queer granular-looking object.) 'You don't know what that is?'

'Give it up,' I said.

'That's a section of the epidermis of the great toe.'

'Great too!' I exclaimed in disgust. 'What on earth have analysts got to do with great toes?'

'Oh, nothing particular,' he said airily. 'But we like to have as much variety as possible. I should like to have a section of everything, if I could get it.—Here's another pretty slide; that is the section of a diseased potato; and this one is a bit of a frog's leg.'

'Very instinctive, I daresay,' I remarked; 'but I hope you haven't made me spend twenty pounds merely to improve your acquaintance with frogs' legs and diseased potatoes. Mr Scrutin surely doesn't analyse such things as these?'

'I can't say we do much in frogs' legs,' he said; 'but there are lots of things adulterated with potato. Flour and arrowroot, and butter, and cocoa, and—and—a heap of things. And the potato's just as likely to be diseased as not. It *may* be, anyhow, and there you are! If you don't know what diseased potato looks like, you're done.'

'A pleasant lookout,' I replied, 'if half-a-dozen of the commonest articles of food are habitually adulterated.'

'Bless you, that's nothing,' he replied. 'If *that* was all, there wouldn't be much harm done. There are a jolly sight worse adulterations than that. In fact, pretty nearly everything's adulterated, and some of 'em with rank poisons.'

'Rank poisons! That's manslaughter!'

'O no; it isn't,' he calmly rejoined. 'Of course, they don't put in enough to kill you right off. And if you find something disagreeing with you, you can't swear what it is. It *may* be the nux vomica in the beer; but it's just as likely to be enteron in the water, or copper in the last bottle of pickles. However, you're all right now. With an analyst in the family, at anyrate you shan't be poisoned without knowing it. I'll let you know what you are eating and drinking.—This fellow!—and he patted the microscope affectionately.—'will tell you all about that.'

And it did. From that day forth I have never enjoyed a meal, and I never expect to do so again. I have always been particular to deal at respectable establishments, and to pay a fair price in the hops of insuring a good article. I have, or had, a very tolerable appetite, and till that dreadful microscope came into the house, I used to get a good deal of enjoyment out of life. But now all is changed. My analyst began by undermining my faith in our baker. Now, if there was one of our tradesmen in whom, more than another, I had confidence, it was the baker, who supplied what seemed to me a good,

solid, satisfying article, with no nonsense about it. But one day, shortly after the conversation I have recorded, my analyst remarked at breakfast-time: 'We had a turn at bread yesterday at the laboratory—examined five samples; and found three of 'em adulterated. And do you know?'—holding up a piece of our own bread and smelling it critically—'I rather fancy this of ours is rather dicky.'

'Nonsense!' I cried. 'It's very good bread—capital bread!'

'You may think so,' he continued calmly; 'but you're not an analyst. I shall take a sample of this to the laboratory, and you shall have my report upon it.'

'Take it, by all means. But if you find anything wrong about that bread, I'll eat my hat!'

'Better not make rash promises. I'll take a good big sample, and you shall have my report on it to-night.'

On his return home in the evening, he began: 'I've been having a go-in at your bread. It's not pure, of course; but there isn't very much the matter with it. There's a little potato, and a little rice, and a little alum; and with those additions, it takes up a good deal more water than it ought, so you don't get your proper weight.'

'Ahem!' I said, 'if that's the case, we'll change our baker. I'm not going to pay for a mixture of potatoes and water, and call it bread. But as for alum, that's all nonsense. If they put that in, we should taste it.'

'O no; you wouldn't. When alum is put in bread, it decomposes and forms sulphate of potash, an aperient salt. It disagrees with you, of course, but you don't taste it. As for changing your baker, the next fellow you tried might be a jolly sight worse; he might put in bone-dust, or plaster of Paris, or sulphate of copper. And besides, half the adulterations are in the flour already, before it reaches the baker. Of course, that doesn't prevent his doing a little more on his own account.'

And with that the matter dropped, so far as the bread was concerned; but my confidence was rudely shaken.

A few days later, my analyst remarked: 'I don't think much of this milk;' and he forthwith appropriated a sample for analytical purposes; but, happily, was compelled to own that it wasn't quite so bad as he expected. It had more than its proper proportion of water; but that might arise—he charitably suggested—from the cow being unwell. To make up the deficiency, it had been fortified with treacle and coloured with annatto, but these my analyst appeared to regard as quite every-day falsifications.

'It's a rascally shame,' I said. 'If one can't put faith in the milk-jug, it's a bad lookout for the Blue Ribbon gentlemen. However, let us hope that the tea and coffee are all right.'

'Not likely!' he rejoined. 'Nearly all tea is "faced," as they call it, more or less, and the facing is itself an adulteration. As for coffee, you don't expect to get that pure, do you? It's sure to be mixed with chicory, anyhow, and very probably with roasted acorns, beans, mahogany sawdust, or old tan. Baked horse-liver occasionally; but that's an extreme case. If by any remote chance there wasn't anything wrong in

the original coffee, you get it in the chicory; and very often there are adulterations in both; so you get 'em twice over.'

'If that's the case, no more ground coffee for me. We'll grind our own, and then we are sure to be safe.'

'You mustn't make too cocksure of that. Some years ago, an ingenious firm took out a patent for a machine to mould chicory into the shape of coffee-berries. Smart chaps those! And of course they can put anything they like into the chicory before they work it up.'

'That's pleasant, certainly. Then how is one to secure pure coffee?'

'You can't secure it, except by sending a sample to us, or some other shop of the same sort, to have it analysed; and if it's wrong, prosecute your grocer for adulteration. After doing that a few times, he might find it didn't pay, and give it up.'

'And how much would that cost?'

'Analysis of a sample of coffee, one guinea; analysis of butter, five guineas; analysis of milk, one guinea; analysis of tea, one guinea. Those are the regular charges for private analyses.'

'Rather expensive, it seems.—And how much would it cost to prosecute?'

'Ah, that I can't tell you,' said my analyst. 'Another five, or more, I daresay.—But look at the satisfaction.'

I did look at it, but ultimately decided to give my grocer the benefit of the doubt, and cherish a fond hope that he was better than his fellows. The subject dropped. But a few days later, there chanced to be apple-pudding on the table. With the dish in question my analyst had always been in the habit of consuming brown sugar, and a good deal of it. Now, however, on the sugar-basin—best Deumerara—being offered to him, he put on an expression as if he had been invited to partake of black draught.

'Raw sugar! No, thank you.'

'Hillo, what's wrong with the sugar? Is that adulterated too?'

'Very probably,' he loftily replied. 'But that's a small matter. The genuine article is bad enough.'

'Bad enough' indignantly interposed my analyst's mamma. 'That's Mr Grittle's very best moist—three-pence-threes-farthings a pound!'

'I daresay it is. If it was fourpence, it wouldn't make any difference.—Did you ever hear of the sugar-mite, *Acarus sacchari*?—'

'No; I can't say I ever did,' I said, 'and I don't want to, either. We have had enough of this sort of thing, and I am not going to have any more agonies over every article we eat.'

I had again put my foot down. But it was too late. I had even forbidden my analyst, under penalty of forfeiture of his pocket-money for several months to come, telling us anything whatever about the food we eat or the drink we imbibe; but the mischief was done. I have lost my confidence in my fellow-man, and still more in my fellow-man's productions. I may try in an imperfect way to protect our household. I may give the strictest orders that none but the refinedest of sugar shall be admitted into our store-cupboard; but who is to answer for the man who makes the jam and the marmalade, or the other man who makes the Madeira

cakes and the three-cornered tarts? And how much is there that we have not heard? I have silenced my analyst's lips, it is true; but there is also a language of the eyes, and still more a language of the nose, and when, with a scornful tip-tilt of the latter, he says, 'No, thank you,' to anything, my appetite is destroyed for that meal. I can't take a pill or a black draught without my disordered imagination picturing my chemist 'pestling a poisoned poison' behind his counter. I can't even eat a new-laid egg or crack a nut without wondering what it is adulterated with. This is morbid, no doubt. I am quite aware that it is morbid, but I can't help it. I am like Governor Sancho in the island of Barataria: my choicest dishes are whisked away from me—or rendered nauseous, which is as bad—at the hidding of a grin being who calls himself Analytical Science. He may not know anything about it, or he may be lying; but meanwhile he has spoilt my appetite, and the dish may go away untasted for me.

Truly, a little knowledge is a dangerous thing. The moral of my painful story is obvious. I intend to bring up the rest of my family, if possible, to occupations involving no knowledge whatever.

THE MONTH: SCIENCE AND ARTS.

About two years ago, we recorded an interesting discovery which had been made on the coast of Norway, that of a viking war-ship, which had formed the tomb of some forgotten Danish free-boater. We have now to chronicle a somewhat similar find, which has recently been unearthed at Brigg, in Lincolnshire. While the workmen were excavating the ground for a new gas-holder, they came upon a block of oak, which ultimately proved to be an ancient British vessel of extraordinary size. It is cut out of a solid piece of wood, and measures forty-eight feet in length, fifty-two inches in width, and thirty-three inches in depth. The boat is in a wonderfully good state of preservation, owing, no doubt, to the clayey nature of the soil in which it lies, and which has effectually sealed up every cranny against the intrusion of the air. The discovery of this prehistoric relic is of such interest, that it is to be hoped some way of preserving it from the action of the weather will be found before it is too late.

Only a few years ago, an ancient wooden causeway was discovered in the same neighbourhood—a causeway made of squared balks of timber fifteen feet long and ten inches square. The ends of these logs were bored with holes for the reception of pegs, so that the whole structure could be firmly fastened to the earth. This was evidently a necessary precaution; for the causeway crosses the valley of the river Ancholme, and would be subject to removal by the action of the tidal waters. It is believed that an extensive shallow lagoon once existed in the Ancholme valley, and that this was slowly filled up with alluvium. It is to this silting up with a non-porous soil that the preservation of both the boat and the causeway is due.

The *Times* of India raises a curious point about a certain meteor of unusual brilliancy which was seen in India on a certain night in January last. Curiously enough, a meteor which was described by eye-witnesses in almost the same language which was used by the Indian observers, passed over London on the same evening. It was travelling in an easterly direction, and appeared about two hours and a half before the meteor noted in India. The question raised by this double appearance is: Are these two meteors really one and the same? The distance between the two points of observation is between five and six thousand miles, which would give a rate of movement for the meteor of thirty-five and a half miles per minute. The question is a startling one, which we should think could be easily answered by consulting the logs of various vessels which were near the presumed track of the meteor on the night of its occurrence. Such an unusual appearance could not fail to have been recorded.

The celebrated Christy Ethnographical Collection has now been added to the British Museum, and for the first time it may be said that the country which has the best opportunities of studying prehistoric and semi-barbarous peoples in all the countries of the world, is not behind its neighbours in its collection of objects for promoting that study. Mr Henry Christy, who died in 1865, left his wonderful collection to four trustees, to deal with it as they might think fit in the best interests of science. These trustees offered the collection to the national Museum on the very wise condition, that it was not to become the property of the Museum until it should be publicly exhibited there. This proviso has prevented the collection being packed away into cellars for an indefinite time, a fate which has befallen too many treasures intrusted to the national Museum.

The delegates of the French Chambers of Commerce who accompanied M. de Lesseps during the late survey of the Panama Canal works, have now returned with hopeful tales of the ultimate success of the grand project for uniting the Atlantic and Pacific Oceans. Briefly put, the matter stands thus: let money be supplied, and the work can be brought to a glorious termination. M. de Lesseps affirms that the canal can be opened for traffic as soon as 1889; and he points to the circumstance that all contracts expire in 1888. But contractors are but mortal, and it is believed by experts that the hard Culebra rocks, which present the most formidable obstacle to the prosecution of the work, cannot be cut through in less than five years. These rocks are more than a mile in length, and in some spots they rise to a height of more than one hundred and fifty feet above the canal level.

In a recent article on 'The National Egg-supply,' a contemporary gives some interesting particulars regarding the productiveness of different kinds of fowls. The laying power of each hen is said to be on an average one hundred eggs per annum. This seems a small average. Some fowls will lay as many as two hundred and twenty per annum, but the larger proportion yield not more than from sixty-five to one hundred and twenty per annum. Care and proper food have much to do with productiveness, as all

keepers of fowls know well. A large portion of our egg-supply comes from Ireland, where the birds are not nearly so well tended as they are in England and Scotland. A score of Irish eggs selected at random from a large crate weighed a little under two pounds. The eggs from good Dorkings will weigh six ounces more than this. The eggs from Spanish fowls weigh two pounds fourteen ounces per score; while those from Legborns weigh as much as three pounds for the same quantity. The total cost of our annual egg-supply is calculated to be nearly seven millions sterling.

Mr W. K. Brooks, of the John Hopkins University of America, has put forward a new observation regarding oyster spat, which may account for the failure of the fisheries in many parts of this country. He remarks that the young oyster as it settles upon the bottom of the sea is in some localities so covered with sediment that it is killed at a very early stage of existence. He holds that the tender oyster should find a resting-place which must be clean as well as free from destructive pests. He recommends the employment of floating frames furnished with a bottom of galvanised wire-netting for the reception of the fry. Under such conditions, it is found that oysters grow with wonderful rapidity.

Anglers know well that the voracious pike is a fish most tenacious of life, and that hours after he has lain in the fishing-creel apparently dead, he is quite capable of giving a snap with his sharp teeth. But few are aware how long a pike will live out of his proper element. A Paris fishmonger recently received a quantity of fish from Rotterdam which were packed in ice. Among these was a pike over two feet long, which, on unpacking, was seen slightly to move its gills. The fish was placed in fresh water, with the result that in a few hours it was fully alive and very active. This fish, as far as can be learnt, was actually out of the water for three days, during which time it travelled nearly three hundred miles. It is now in the Trocadero Aquarium, and seems to have fully recovered from its curious experience.

The *Sanitary Record* informs metropolitan householders that their peace is threatened with a new danger. A London resident found that each time the water was turned on to his house, a plentiful supply of coal-gas was delivered gratis at the same time and through the same pipes. The explanation of the matter is as follows: in the particular street where this strange thing happened, the soil round the water main is completely saturated with gas from leaky pipes. When the water is turned off, there is a vacuum formed in the main, and gas is sucked in through imperfect joints, to be delivered to the unfortunate residents directly the water is again turned on. The matter can of course be easily remedied; but the serious lesson taught by the incident is that gas can find its way to water-pipes, and that sewer-gas may as easily do so as coal-gas.

The last application of rock-oil is a petroleum engine, which we saw working lately in London. In general appearance, it is like a gas engine; but it has a tank fixed above the cylinder which contains a supply of petroleum. This liquid is conveyed by a small pipe and pump to the

cylinder at the rate of about four drops per stroke of the piston rod. It is ignited by a spirit-lamp after having been mingled with sufficient air to form an explosive mixture. The working cost of the engine is calculated at three-halfpence per horse-power per hour for petrolum, and one-sixth of that sum for lubricating. The engine will be valuable where gas is not to be obtained and where steam is inadmissible.

Mr William Anderson lately delivered an interesting lecture before the Royal Institution 'On New Applications of the Mechanical Properties of Cork to the Arts.' He showed that cork was unique among solid substances in being capable of cubical compression both from forces applied in opposite directions and from pressure from all sides. This is shown when cork is immersed in water and is subjected to hydraulic pressure. The phenomenon in question is due to the peculiar cellular structure of the material, which causes it to behave more like a gas when under pressure than like a solid. Mr Anderson proposes to use cork instead of air in the air-vessels of water-raising machinery, and he showed by experiment how well fitted it was for doing this duty. He also proposes to use it in connection with gun-carriages in the following way: the carriage is to be furnished with hydraulic compressors in the customary manner, but the water in the cylinders is to be driven by the recoil of the gun into a vessel filled with cork. This will represent a store of energy which will run the gun out again when loaded, by the aid of a tap which will liberate the water from the compressed cork. The lecture certainly exhibited cork in a new character, and called attention to many ways in which it can be used with advantage.

The nebula in the Pleiades, so strangely discovered by photography, although it was quite invisible to ordinary telescopic scrutiny, has now been detected by more than one observer. It is, however, as may be guessed, an extremely faint object. MM. Perrotin and Thollon, of the observatory at Nice, say that they have seen it, but admit at the same time that this was only because they knew from the Paris photograph that it existed.

The number of valuable substances which can be extracted from coal-tar is marvellous, and would surprise gas manufacturers of a generation ago, who gladly gave away the tar to anyone who would take it. The last product of the black and ill-smelling fluid is a substance which has been named Saccharin, on account of its extreme sweetness, and the discovery is due to Professor Fahlberg. Saccharin is said to be two hundred and thirty times sweeter than the best cane-sugar. It has a great interest for the medical profession, for it can be used to render palatable the food of patients suffering from diabetes, and has been already adopted for this service in one of the Berlin hospitals. At present, the new sweetener costs forty shillings per pound. It has been ascertained by experiment that saccharin is innocuous; and we may feel sure that if its price can be reduced, it will become a formidable rival to sugar.

The chief of the United States Geological Survey, Major Powell, has discovered near California what he believes to be the oldest human habitations on the American continent.

The mountains in the vicinity are covered with beds of lava, in which have been excavated square rooms, lined with a kind of cement made with lava. Although these rock-dwellers were of prehistoric time, their work shows traces of an advanced civilisation. Several articles of pottery have been found in these cave-dwellings, as well as a kind of cloth made of woven hair. Wrapped in such a cloth, which tumbled into dust when touched, there was found a small image resembling a man. No fewer than sixty groups of these villages in the lava have been found.

Mr Eric S. Bruce, who has been experimenting during the past year for the government with a balloon for signalling purposes, which he has invented, is about to exhibit a balloon of the same kind at the Crystal Palace, Sydenham. This aerostat will have a capacity of eighty thousand cubic feet, sufficient to give it the necessary lifting power to carry up several passengers. The balloon will be a captive one, like that exhibited at Paris in 1878, and will, like its huge forerunner, be hauled down to the earth after each ascent, by steam-power. It will ascend for the amusement of visitors during the daytime, telephonic communication being maintained between the car and the earth; whilst at night it will be illuminated by the electric light, so that Mr Bruce's method of signalling may be fully demonstrated.

The number of deep wells sunk in London and its neighbourhood during the past thirty years has had the effect of lowering the general water level in the chalk to the amount of about twelve inches annually. But there is still a very large quantity available—so the experts say—without sinking shafts to extraordinary depths. Much interest attaches to the subject at the present time on account of the threatened action of the London corporation to sink wells for themselves, as the strongest protest they can offer against the high charges of the Water Company supplying the city.

The title of one of Turner's best pictures, 'The *Téméraire* towed to her last Moorings,' comes to the mind as one hears that the *Great Eastern*, the largest steamship ever built, too large, indeed, to be profitably worked, has steamed round to Liverpool to serve as a show-place during the Maritime Exhibition there. After this last duty is done, this monument of Brunel's wonderful skill will take up her position as a coal-bulk.

People who rejoice in the possession of wealth and who have plenty of time on their hands, generally develop into 'collectors.' Coins, pictures, books, china, orchids, postage-stamps, &c., have their periods as the fashionable things to gather together. The last craze of this kind is devoted to engraved plates. Old copper plates are perhaps the best; and the way to preserve and exhibit them is as follows: the plate is rolled with ink and polished, just as if an impression were required of it. It is then set aside for the ink to dry, when it receives a coating of clear varnish, to protect it from the oxidising action of the air. It is now framed and hung up like an ordinary picture.

The Kyrle Societies have seldom reason to congratulate iron manufacturers on the progress of their art; but it seems as if they might

heartily rejoice in a Report recently made at the instance of the North-eastern Steel Company as to this utilisation of an important by-product of the steel manufacture. The Report is on the results of experiments made to test the value of basic cinder as a manure, and is the joint work of Professor Wrightson and Dr Munro, of the College of Agriculture, Downton, Salisbury. Basic cinder, or basic steel slag, is the broken-up and useless lining of the converters used in the Thomas-Gilchrist process for dephosphorising iron, and is a bulky by-product of the manufacture. It contains from sixteen to nineteen per cent. of phosphoric acid combined with lime and other bases; and the Report in question puts it beyond a doubt that the undissolved phosphates of the cinder have an available and remarkable value for manurial purposes. Extensive and elaborate experiments conducted at Downton and elsewhere showed decisively that this heretofore inconvenient substance is an excellent fertiliser for swedes and other turnips, as well as for grass. It seems to be positively better for this purpose than ground coprolites, and only a little less effective than superphosphate. This interesting Report is published at the *Daily Exchange Office*, Middlesbrough. Similar experiments have been attended with like success in Germany; and from *Le Temps* it would appear that enterprising agricultural chemists are already in treaty with some of the blast-furnaces of Alsace-Lorraine for the purchase of all the slag produced by them.

The history of the recovery of a portion of the mails from the Cunard steamer *Oregon*, ought to supply chemists and inventors with a good deal of food for thought. Before the vessel sank, a portion of the mail was recovered, but by far the greater portion went down with her. This was the case with the registered letters, the portion of the mail containing securities, coupons, &c., to the value of at least one hundred thousand pounds, besides drafts, letters of credit, &c., of which the value was unknown. A notice has been issued by the Liverpool postmaster which tells us that the whole of these registered letters have been recovered. The letters were thoroughly soaked, but the post-office authorities dried them as carefully as they could and sent them on to their destination. All the mail-matter that has been recovered was badly damaged by wetting, while the bags which were subjected to long-continued soaking at the bottom of the sea were very much damaged. In one case, a fifty pound note sent from Frons to Chicago was delivered only just recognisable, but still sufficient to insure its being honoured.

These facts have led an American scientific journal to urge the necessity for waterproof mailbags, waterproof paper, and waterproof ink. Waterproof mailbags alone will not be sufficient, as, in the process of handling them or raising them from a sunken vessel, they are liable to be rendered leaky. Waterproof paper, again, would be of no service unless it was accompanied by waterproof ink. The mailbags need only be waterproof in the ordinary acceptance of the term; and if there could be certainty that they would remain so, nothing more would be needed to protect documents or anything else placed in them; but as holes are likely to be worn or

torn in them, the only final resource is the production of paper and ink that will resist the prolonged action of sea-water. If such a paper and ink can be produced at a reasonable cost, they would meet with a ready market throughout the civilised world. But the paper must be lighter, more flexible, and more opaque than the waterproof parchment paper now obtainable.

The lesson which the loss of this *Oregon* seems to teach the commercial world is, that a convenient waterproof paper is required for transatlantic correspondence. Modern chemistry and mechanical invention ought to be able to meet this want.

No class of the community has received so much good advice as that to which the farmer belongs, and it would be a wonder if he did not resent some of it, and say that it is not good advice that is wanted most, but good seasons. However, when a practical lesson comes within one's reach for the better utilisation of available material, only a foolish person would neglect to learn it. In the model dairy at the Brighton Show, last summer, Professor Long gave an explanatory demonstration of the simple methods of making three kinds of soft cheese, by the employment of tinned-iron hoops, beech-boards, straw-nuts, milk-vessels, draining-shelves, and a thermometer. In the *Journal of the Bath and West of England Society*, he has recently drawn attention to the subject again, and explains his method whereby the farmer may utilise his skim-milk by the profitable manufacture of soft cheese. It seems that anybody can learn the processes; and a few experiments will teach the practice of ripening the cheeses in an apartment having a regulated temperature proper for the development of the necessary white mould, followed by blue mould, producing the most accepted flavour.

From a gallon of 'whole' milk, costing sixpence, Professor Long made Brie cheese—the most famous of French varieties—worth, at ten days to three months old, from one shilling to one shilling and sixpence; from half a gallon of milk, half of it skim-milk, valued at twopence-halfpenny, he made Coulommiers, a round cheese worth at least eightpence; and from skim-milk only, costing about one penny, he made a square variety, of his own invention, named Graveley cheese, partaking of the qualities of the Limburg of Germany and the Livarot of France. We understand that nearly six millions of the delicious Brie cheeses are made annually in certain districts of France for the Parisian market. An important point will be gained, however, in this country, if some of our farmers begin to convert their skim-milk into a product which will sell at three or four times the value of the milk.

Honey-wine is said to be excellent; and Dzierzon—one of the most famous German writers on scientific bee-keeping—tells us that it is often manufactured by peasants in Eastern Europe. It is made as follows: Twenty-five pounds of honey are mixed with four and a half gallons of water in a bright copper boiler, the mixture being gently boiled and constantly skimmed during half an hour. Three pounds of finely powdered chalk are then gradually added, under constant stirring. The tough scum which rises

to the surface is skimmed off, and when no more rises, the liquid is poured into a wooden vessel, where it is allowed to settle. The liquid is then carefully decanted into the cleaned kettle, mixed with six pounds of finely powdered and recently burned charcoal, and raised to boiling. It is now once more poured into the wooden vessel, allowed to cool, and then filtered through felt or flannel. It should be stated that the chalk is added to neutralise free acid, whilst the charcoal removes the waxy taste. The filtered liquor is then transferred to the boiler, mixed with the white of twenty-five eggs, and raised to boiling, when the coagulated albumen will have clarified the liquid. After having kept the liquid at a gentle boil for one hour longer, it is allowed to cool, and is then poured into a cask, which must not be quite full, and the bung-hole covered with a piece of clean linnen. In this condition it is allowed to remain until fermentation has been completed. When it is perfectly clear, the liquid is drawn off into bottles. We are told by Dzierzon that this wine, if properly prepared, resembles the best brands of Madeira, and is a truly royal beverage. It keeps for any length of time, provided the bottles are stored in a cool cellar.

A NEW THEORY OF DEW.

THE explanation of the formation of dew and hoar-frost which Dr Wells published about seventy years ago, has been almost universally accepted as satisfactory ever since. Shortly stated, Dr Wells' 'Theory of Dew' is as follows: Air always contains a certain amount of moisture in the form of invisible vapour. The hotter the air is, the more vapour will it contain. Thus, during a warm day, a good deal of moisture passes into the air; and when the temperature falls in the evening, some of it is deposited as a fine mist. But even when this mist does not appear, dew is formed. As soon as the sun is down, especially if it is a clear evening, the grass, trees, shrubs, and even the soil itself rapidly get cooled by radiating into space the heat which they contain. These cooled bodies in turn cool the warm air above them, and this causes it to deposit more or less of its moisture, which appears either as a film or in minute drops of dew. The points of the grass, small twigs, and all other good radiating surfaces are cooled the most; and accordingly we find the dewdrops most abundant on these bodies; whilst on metal or hard stone surfaces, which are poor radiators, we seldom or never find any dew. A clear, cloudless sky, which promotes radiation, is always favourable to the formation of dew; but on cloudy nights, little is formed, because the clouds return the heat radiated from the earth.

Hoar-frost is only dew deposited on bodies cooled below the freezing-point. It is formed in winter when the temperature of the air during the day is only a little over this point. At night, the grass and ground are soon cooled below thirty-two degrees Fahrenheit, and what moisture is deposited appears as minute ice-crystals or hoar-frost.

Many experiments can be cited which tend to strengthen and confirm this explanation. Thus, every one is familiar with the fact of glass bottles, mirrors, &c., being covered with moisture on being brought into a warm room. The same thing happens with a cold cabbage leaf, or with a bundle of vegetables or a bunch of flowers. On a cold night, the windows of a warm room soon get dimmed. Still more striking is a phenomenon which frequently occurs in countries where the temperature is much below the freezing-point in winter. The houses are well heated, and if a number of people are together, as in a ballroom, the air soon becomes moisture-laden. If the ventilation is not over-good, it may happen that a door or window will be opened. With the rush of cold air from without, the merry-makers are often alarmed by being suddenly covered with hoar-frost, or sometimes even a shower of snow. This does not come from the outside, as it occurs most readily on cold, clear, starlit nights. It is the moisture of the air of the room suddenly cooled below freezing-point that appears as snow or hoar-frost. Many similar experiments may be noticed, all of which are satisfactorily accounted for on Dr Wells' theory.

Yet, within the last few months, Mr Aitken, in a communication to the Royal Society of Edinburgh, has brought forward many observations, and the results of numerous experiments, which appear to prove that Dr Wells' theory of dew is not, after all, correct.

The essential difference between the old and the new theories is as to the source of the moisture which forms the dew. Instead of being condensed from the air above by the cooled vegetation, Mr Aitken maintains that it comes from the ground. The author of the original theory admits that some of the dew might come from below, but affirmed that it must be an exceedingly small proportion. Mr Aitken's experiments, on the contrary, seem to prove that most if not the whole comes from the ground.

It is quite clear that the grass and soil do get rapidly cooled on dewy nights; but if they are below the temperature of the air above, the ground just under the surface is much warmer. Thermometers placed on the surface of grass were often found ten to eighteen degrees lower than those placed under the surface among the stems. In such circumstances, vapour must be rising from the soil, and part of it will condense on the grass, which has been cooled by radiation. By carefully weighing small squares of turf cut from a lawn before and after the appearance of dew on them, it was always found that they *lost* weight. If the dew had condensed out of the surrounding air, the turf would have *gained* in weight by the amount of dew deposited. It was thus clear that vapour was rising from the ground, only part of which was condensed on the grass, the remainder passing into the air.

Another experiment, pointing to the same conclusion, was made by inverting thin trays over the grass. On dewy nights these trays were always found wet on the under surface; and the grass below them was always much wetter than that freely exposed outside. The moisture rising from the ground was evidently trapped and condensed, instead of being allowed to pass freely into the atmosphere.

The explanation of the absence of dew on the surface of stones, roads, and other hard surfaces, on the old theory was, that these, being poor radiators, did not get much cooled. But closer observation shows that dew does form on stones and clods and gravel, only it is chiefly on the under surfaces. Thus, slates laid over both hard and gravelly roads are always found dripping wet on their under surfaces on dewy nights; while their upper surfaces and the surrounding roads are dry. During frost, too, clods and stones on the surface of the soil are almost always found to be covered with hoar-frost, showing that the moisture is trapped as it rises from the soil.

But perhaps the most interesting observations and experiments were those made to determine the origin of the 'dewdrops' on grass and vegetables. In the first place, it is found that these drops do not appear on all plants. Some are wet, while others growing alongside are dry, though there could be no great difference in their radiating power. Then the leaves do not get wet all over, but only at the edges and on the tips. A closer observation reveals the fact that these so-called, 'dewdrops' are formed at the end of the minute veins of the leaves and grass, and are not now recognised as dew at all, but moisture exuded from the interior of the plants themselves. Moreover, these drops always appear before the true dew in the evening, and very often are seen when no true dew is formed. They even appear when the vegetables are placed under conditions where condensation of the surrounding water-vapour is impossible, and must, therefore, be due to the vital activity of the plants.

Another observation may be mentioned which clearly shows that moisture rising from below may become condensed on the cooled surfaces of loose material. If the weather is at all cold, the beard and moustaches get covered with moisture; and in very cold climates, the eyebrows, hair, and whiskers get covered with a coating of hoar-frost. The moisture which forms this certainly comes from the body, which is always at a much higher temperature than the surrounding air.

All these observations and experiments have led to the conclusion that moisture is constantly being given off from the earth; and that, except on the rare occasions when a warm moisture-laden wind blows gently over a previously cooled surface, it only returns to the surface of the ground after being condensed into rain, sleet, snow, or hail. Dew is only a portion of the outward current trapped on the exposed and cooled surfaces of the grass and other bodies.

COMRIE EARTHQUAKES.

REGARDING earth-tremors or earthquakes, which, curiously enough, seem to be mainly confined in Scotland to Comrie, in Perthshire, a correspondent writing from Comrie kindly favours us with the following notes as to the erection which is there devoted to the registering of earthquakes. Our correspondent says:

I recently visited the building with a view of giving you a few notes as to its history and

torn in them, the only final resource is the production of paper and ink that will resist the prolonged action of sea-water. If such a paper and ink can be produced at a reasonable cost, they would meet with a ready market throughout the civilised world. But the paper must be lighter, more flexible, and more opaque than the waterproof parchment paper now obtainable.

The lesson which the loss of the *Oregon* seems to teach the commercial world is, that a convenient waterproof paper is required for transatlantic correspondence. Modern chemistry and mechanical invention ought to be able to meet this want.

No class of the community has received so much good advice as that to which the farmer belongs, and it would be a wonder if he did not resent some of it, and say that it is not good advice that is wanted most, but good seasons. However, when a practical lesson comes within one's reach for the better utilisation of available material, only a foolish person would neglect to learn it. In the model dairy at the Brighton Show, last summer, Professor Long gave an explanatory demonstration of the simple methods of making three kinds of soft cheese, by the employment of tinned-iron hoops, beech-boards, straw-mats, milk-vessels, draining-shelves, and a thermometer. In the *Journal of the Bath and West of England Society*, he has recently drawn attention to the subject again, and explains his method whereby the farmer may utilise his skim-milk by the profitable manufacture of soft cheese. It seems that anybody can learn the processes; and a few experiments will teach the practice of ripening the cheeses in an apartment having a regulated temperature proper for the development of the necessary white mould, followed by blue mould, producing the most accepted flavour.

From a gallon of 'whole' milk, costing sixpence, Professor Long made Brie cheese—the most famous of French varieties—worth, at ten days to three months old, from one shilling to one shilling and sixpence; from half a gallon of milk, half of it skim-milk, valued at twopence-halfpenny, he made Coulommiers, a round cheese worth at least eightpence; and from skim-milk only, costing about one penny, he made a square variety, of his own invention, named Graveley cheese, partaking of the qualities of the Limburg of Germany and the Livarot of France. We understand that nearly six millions of the delicious Brie cheeses are made annually in certain districts of France for the Parisian market. An important point will be gained, however, in this country, if some of our farmers begin to convert their skim-milk into a product which will sell at three or four times the value of the milk.

Honey-wine is said to be excellent; and Dzierzon—one of the most famous German writers on scientific bee-keeping—tells us that it is often manufactured by peasants in Eastern Europe. It is made as follows: Twenty-five pounds of honey are mixed with four and a half gallons of water in a bright copper boiler, the mixture being gently boiled and constantly skimmed during half an hour. Three pounds of finely powdered chalk are then gradually added, under constant stirring. The tough scum which rises

to the surface is skimmed off, and when no more rises, the liquid is poured into a wooden vessel, where it is allowed to settle. The liquid is then carefully decanted into the cleaned kettle, mixed with six pounds of finely powdered and recently burned charcoal, and raised to boiling. It is now once more poured into the wooden vessel, allowed to cool, and then filtered through felt or flannel. It should be stated that the chalk is added to neutralise free acid, while the charcoal removes the waxy taste. The filtered liquor is then transferred to the boiler, mixed with the white of twenty-five eggs, and raised to boiling, when the coagulated albumen will have clarified the liquid. After having kept the liquid at a gentle boil for one hour longer, it is allowed to cool, and is then poured into a cask, which must not be quite full, and the bung-hole covered with a piece of clean lincn. In this condition it is allowed to remain until fermentation has been completed. When it is perfectly clear, the liquid is drawn off into bottles. We are told by Dzierzon that this wine, if properly prepared, resembles the best brands of Madeira, and is a truly royal beverage. It keeps for any length of time, provided the bottles are stored in a cool cellar.

A NEW THEORY OF DEW.

THE explanation of the formation of dew and hoar-frost which Dr Wells published about seventy years ago, has been almost universally accepted as satisfactory ever since. Shortly stated, Dr Wells' 'Theory of Dew' is as follows: Air always contains a certain amount of moisture in the form of invisible vapour. The hotter the air is, the more vapour will it contain. Thus, during a warm day, a good deal of moisture passes into the air; and when the temperature falls in the evening, some of it is deposited as a fine mist. But even when this mist does not appear, dew is formed. As soon as the sun is down, especially if it is a clear evening, the grass, trees, shrubs, and even the soil itself rapidly get cooled by radiating into space the heat which they contain. These cooled bodies in turn cool the warm air above them, and this causes it to deposit more or less of its moisture, which appears either as a film or in minute drops of dew. The points of the grass, small twigs, and all other good radiating surfaces are cooled the most; and accordingly we find the dewdrops most abundant on these bodies; whilst on metal or hard stone surfaces, which are poor radiators, we seldom or never find any dew. A clear, cloudless sky, which promotes radiation, is always favourable to the formation of dew; but on cloudy nights, little is formed, because the clouds return the heat radiated from the earth.

Hoar-frost is only dew deposited on bodies cooled below the freezing-point. It is formed in winter when the temperature of the air during the day is only a little over this point. At night, the grass and ground are soon cooled below thirty-two degrees Fahrenheit, and what moisture is deposited appears as minute ice-crystals or hoar-frost.

Many experiments can be cited which tend to strengthen and confirm this explanation. Thus, every one is familiar with the fact of glass bottles, mirrors, &c., being covered with moisture on being brought into a warm room. The same thing happens with a cold cabbage leaf, or with a bundle of vegetables or a bunch of flowers. On a cold night, the windows of a warm room soon get dimmed. Still more striking is a phenomenon which frequently occurs in countries where the temperature is much below the freezing-point in winter. The houses are well heated, and if a number of people are together, as in a ballroom, the air soon becomes moisture-laden. If the ventilation is not over-good, it may happen that a door or window will be opened. With the rush of cold air from without, the merry-makers are often alarmed by being suddenly covered with hoar-frost, or sometimes even a shower of snow. This does not come from the outside, as it occurs most readily on cold, clear, starlit nights. It is the moisture of the air of the room suddenly cooled below freezing-point that appears as snow or hoar-frost. Many similar experiments may be noticed, all of which are satisfactorily accounted for on Dr Wells's theory.

Yet, within the last few months, Mr Aitken, in a communication to the Royal Society of Edinburgh, has brought forward many observations, and the results of numerous experiments, which appear to prove that Dr Wells's theory of dew is not, after all, correct.

The essential difference between the old and the new theories is as to the source of the moisture which forms the dew. Instead of being condensed from the air above by the cooled vegetation, Mr Aitken maintains that it comes from the ground. The author of the original theory admitted that some of the dew might come from below, but affirmed that it must be an exceedingly small proportion. Mr Aitken's experiments, on the contrary, seem to prove that most if not the whole comes from the ground.

It is quite clear that the grass and soil do get rapidly cooled on dewy nights; but if they are below the temperature of the air above, the ground just under the surface is much warmer. Thermometers placed on the surface of grass were often found ten to eighteen degrees lower than those placed under the surface among the stems. In such circumstances, vapour must be rising from the soil, and part of it will condense on the grass, which has been cooled by radiation. By carefully weighing small squares of turf cut from a lawn before and after the appearance of dew on them, it was always found that they lost weight. If the dew had condensed out of the surrounding air, the turf would have gained in weight by the amount of dew deposited. It was thus clear that vapour was rising from the ground, only part of which was condensed on the grass, the remainder passing into the air.

Another experiment, pointing to the same conclusion, was made by inverting thin trays over the grass. On dewy nights these trays were always found wet on the under surface; and the grass below them was always much wetter than that freely exposed outside. The moisture rising from the ground was evidently trapped and condensed, instead of being allowed to pass freely into the atmosphere.

The explanation of the absence of dew on the surface of stones, roads, and other hard surfaces, on the old theory was, that these, being poor radiators, did not get much cooled. But closer observation shows that dew does form on stones and clods and gravel, only it is chiefly on the under surfaces. Thus, slates laid over both hard and gravelly roads are always found dripping wet on their under surfaces on dewy nights; while their upper surfaces and the surrounding roads are dry. During frost, too, clods and stones on the surface of the soil are almost always found to be covered with hoar-frost, showing that the moisture is trapped as it rises from the soil.

But perhaps the most interesting observations and experiments were those made to determine the origin of the 'dewdrops' on grass and vegetables. In the first place, it is found that these drops do not appear on all plants. Some are wet, while others growing alongside are dry, though there could be no great difference in their radiating power. Then the leaves do not get wet all over, but only at the edges and on the tips. A closer observation reveals the fact that these so-called 'dewdrops' are formed at the end of the minute veins of the leaves and grass, and are not now recognised as dew at all, but moisture exuded from the interior of the plants themselves. Moreover, these drops always appear before the true dew in the evening, and very often are seen when no true dew is formed. They even appear when the vegetables are placed under conditions where condensation of the surrounding water-vapour is impossible, and must, therefore, be due to the vital activity of the plants.

Another observation may be mentioned which clearly shows that moisture rising from below may become condensed on the cooled surfaces of loose material. If the weather is at all cold, the beard and moustaches get covered with moisture; and in very cold climates, the eyebrows, hair, and whiskers get covered with a coating of hoar-frost. The moisture which forms this certainly comes from the body, which is always at a much higher temperature than the surrounding air.

All these observations and experiments have led to the conclusion that moisture is constantly being given off from the earth; and that, except on the rare occasions when a warm moisture-laden wind blows gently over a previously cooled surface, it only returns to the surface of the ground after being condensed into rain, sleet, snow, or hail. Dew is only a portion of the outward current trapped on the exposed and cooled surfaces of the grass and other bodies.

COMRIE EARTHQUAKES.

RECORDING earth-tremors or earthquakes, which, curiously enough, seem to be mainly confined in Scotland to Comrie, in Perthshire, a correspondent writing from Comrie kindly favours us with the following notes as to the erection which is there devoted to the registering of earthquakes. Our correspondent says:

I recently visited the building with a view of giving you a few notes as to its history and

construction. I may state that about fourteen years ago, the British Association applied to Mr Drummond of Drumearn for leave to erect a house on his property, which he at once granted free of charge, and assisted to defray the cost of erection.

The reason why the British Association selected a site here and erected this earthquake-house at Comrie, was on account of the long-continued periodical shocks that had been felt in Upper Strathearn, particularly from the year 1780 to 1848. About the former date, they had been rather severely felt over the whole district, and damage to some extent done to buildings. On a sheet of water near to Lawers House, the ice was shattered to pieces. Some of the inhabitants at that time kept a record of their occurrence; and we believe the late Sir David Dundas, of Duntra, had a seismometer placed on his estate in Glenlednoch, to the north of Comrie; but there seems to be no evidence to show that it had ever indicated any shock. Coming down to the year 1839, the inhabitants of the village of Comrie were greatly alarmed, about eleven o'clock on the night of the 23d of October, by one of the most violent tremors that had been experienced there; and the good people rushed out of their houses and assembled in the old Secession Church for prayer, which was conducted by the Rev. R. T. Walker, the minister of that church. Many others fled to the hills. But no serious damage was done to property, save some rents in the chimneys. From 1839 to 1847, tremors continued to be more frequent, causing considerable alarm by the movements of furniture and crockery.

The work of erecting the building proposed by the British Association was carried out under the care of the late Dr James Bryce of Glasgow, who resided here for many seasons, and was well acquainted with the locality and its geological formation. The site chosen is a rising ground near Drumearn House, and is built on rock that is supposed to extend a considerable distance westward. The building is stone, and slated, and is about seven feet square inside. The floor is laid with Arbroath pavement, on solid rock, and is overlaid with fine sand, on which are placed two boards, at right angles to each other. These boards are six feet long by nine inches broad, and on each are placed, standing, nine round wooden pins, varying from the fourth of an inch to an inch and a half in diameter, but all of one height (eight inches).

The building is in excellent condition, and the pins or markers are in their place, awaiting the action of an earthquake to record the desired information as to the severity and direction of this now seemingly extinct agency of force in Upper Strathearn. The size of pin or cylinder thrown down, and the direction in which it falls, indicate the strength of shock as well as its direction. Any one who feels interested and may wish to visit the building will readily get access by applying to Mr Drummond.

Many theories have been propounded as to the cause of the earthquakes which have visited this district. The late Mr Patrick McFarlane of Comrie, who took a great interest in them, erected a seismometer in the steeple of the parish church of Comrie, which was visited by many of the

members of the British Association and others; but so far as we are aware, it never registered any markings. It was a very simple apparatus. The pendulum was of considerable length, and all but rested on a table overlaid with magnesia, which, being light, offered no resistance to the oscillation of the pendulum. A few slight shocks occurred between 1847 and 1877, but these attracted little notice.

I may remark that no earthquake had, till recently, been felt here for some years, consequently, there had been no registering. But on Sunday morning 18th April last, at one o'clock, and again on Thursday the 22d of the same month, about half-past five A.M., a slight earthquake occurred. I visited the earthquake-house on both occasions; but there were no markings, none of the pins having fallen.

WHICH?

If thou art false as thou art fair,
And false the fairest fair may be,
Again the wondrous power to snare,
Again the siren's self we see.
There's danger in those dimpling smiles,
It glances from that witching e'e,
And he who would escape thy wiles,
Must quickly from the tempter flee.

For better far, as sages tell,
From fickle fair to bid adieu,
Than fall beneath the magic spell
Of charms the heart may ever rue.
Beware, if false, of beauty bright,
Beware that luring beacon's ray,
For, oh! the love that trusts its light,
May drift a wreck ere dawn of day.

But if thou'rt true as thou art fair,
Art leal in heart, though seeming gay,
Wouldest ever constant prove, and no'er
With faithful heart all faithless play,
Then thou'rt a gem worth more than gold,
More precious than the ruby rare,
More to be prized than wealth untold,
True heart enshrined in form so fair.

JOHN NAPIER.

The Conductor of CHAMBERS'S JOURNAL begs to direct the attention of CONTRIBUTORS to the following notice:—
1st. All communications should be addressed to the Editor, 339 High Street, Edinburgh.

2d. For its return in case of ineligibility, postage-stamps should accompany every manuscript.

3d. To secure their safe return if inelligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, should have the writer's Name and Address written upon them in FULL.

4th. Offerings of Verse should invariably be accompanied by a stamped and directed envelope.

If the above rules are complied with, the Editor will do his best to ensure the safe return of ineligibile papers.

HOSTESS AND GUEST.

BY MRS POWER O'DONOGHUE.

PART I.—THE DUTIES OF A HOSTESS.

I HAVE often thought that a few practical hints relative to the preparations for and treatment of a guest who comes to be a member of the household for a while, would not, perhaps, be thrown away upon the general company of readers. I therefore venture to offer these hints in homely fashion, feeling that I am, as it were, treading upon almost new ground, for the matter is one that appears to me to have been, considering its importance, wonderfully little discussed.

Before entering upon my subject, I would wish to say that my observations and advice are not addressed to those heads of families who have large establishments and a numerous staff of servants at command; such, of course, have merely to signify to the housekeeper or upper house-maid that a guest is expected, and give directions that such and such a room be prepared: the green, the yellow, blue, or any other colour, as the case may be. I desire rather to write for those heads of houses who belong to the middle classes, and for ladies who, for lack of means, can afford to keep but one servant, or at the most two.

It may, perhaps, be said that in the former case a visitor ought not to be invited at all; but that is mere nonsense, for there are times and circumstances when such a mark of civility is undoubtedly due, and when it cannot with propriety be avoided; nor need there be any reason, in a properly regulated household, why a guest should not be lodged and entertained quite as comfortably, if less luxuriously, in an unpretentious dwelling as within the lordliest halls. Of course, a great deal must depend upon the style of living to which the visitor is accustomed. It would, for instance, be unwise for a hostess with limited means at her command to undertake the entertaining of a wealthy nabob, who, from being born with the proverbial silver spoon

in his mouth, knows nothing of difficulties or struggles with the world, and is in consequence a mere mass of selfish exactitude and caprice. Nor would it be judicious for a person of moderate income to invite a gourmet, who lives to pamper his appetite, and is guilty of such vulgar pomposities as passing the wines beneath his nose before tasting them, in order that he may boast of his knowledge of the various vintages to which they belong. It is likewise unwise for a host or hostess of limited resources to extend an offer of hospitality to a fine lady or gentleman who cannot travel without a maid or valet in attendance upon them. Strange servants are an intolerable nuisance among a household, and it is usual for those who have had experience of them, to declare that they would rather entertain a dozen guests in the dining-room than cater for one in the kitchen or servants' hall.

In the event of a hostess deeming it a necessity—which sometimes occurs—to invite a guest whose household and style of living are to her knowledge superior to her own, she should not be in the least ashamed to confess the fact, or feel in the smallest degree embarrassed about doing so. She should, on the contrary, refer to it—once only—with easy grace, exhibiting no trace of 'awkwardness,' for there is not any shame in being unable to cope with those who are wealthier than ourselves, nor can riches ever weigh against gentility of soul. Were we to ape what we cannot have—to strive after position which we cannot attain—to attempt style that we cannot keep up—to cheat honest tradesmen out of their lawful earnings in order to gratify some expensive taste which we have no right to indulge—then, indeed, might a blush lawfully arise; but there is nothing in upright frugality to make even the most sensitive feel ashamed.

I have said, refer to the matter once only, because I consider it a sign of extreme bad taste to keep perpetually offering apologies to visitors, in the event of things not being quite so grand or imposing as the hostess may desire. How

frequently we are put to the pain of listening to such sentences as: 'Do, pray, take some more; although I know it is not so good as you have at home'—'I hope you slept well, though I am afraid you missed your own fine big room,' &c. This display of deferential anxiety cannot be otherwise than painfully embarrassing to a visitor, and looks as though the hostess were either throwing out perpetual hints for compliments upon the excellence of her house and table, or as if she were really uncomfortably conscious of deficiencies which are perhaps noticeable to herself alone. A few words—the briefer the better—spoken to the guest on arrival, or inserted in the note of invitation, are sufficient to answer all purposes: 'You are aware, Miss—or Mr.' (as the case may be), 'that our means are not sufficient to admit of any style; but I hope you will be comfortable, and I am sure you will be welcome.'

A hostess of moderate income, such as I am writing for, should always ascertain personally that the bedchamber intended for her guest's use is comfortably arranged and the bed-clothing properly aired. These are things which, if left to the care of the ordinary run of servants, will in most instances be performed in a very slovenly manner. As I intend that these observations shall be of a decidedly practical nature, I shall state plainly my ideas respecting the arrangement of a guest-chamber in an ordinary middle-class house. Ignoring, then, the existence of a family bathroom, the visitor's apartment should be provided with a bath, a large sponge, and a plentiful supply of towels. The first of these should be kept turned up in some spare corner by day, and laid down at night by the chambermaid, with a square of oilcloth or felt underneath, to save the carpet from being wetted; for some persons are very untidy bathers, and make a terrible splashing when they indulge in a 'tub.' The sponge should be kept in a little basket, made to hook on to the lower rail of the towel-stand, which is in every way preferable to keeping it in a bag. Care should be taken that the looking-glass does not, when touched, make a low salaam—the upper end coming down upon the nose of the visitor, while the lower portion departs out of sight! This is very frequently the case in hotels and lodging-houses, and indeed in too many private dwellings also; and it can be so easily rectified by the bestowal of a little care upon the screws, that it is quite wonderful how persons can contentedly go on from month to month propping up the disabled toilet-mirror—or leaving others to do it—with a hairbrush, or pocket-handkerchief, or half a newspaper folded into a pad.

Be sure, also, if you are expecting a visitor, to leave the wardrobe in the guest-chamber perfectly empty, and all the shelves neatly swept and papered. Be certain to attend particularly to this matter, more especially if the expected visitor be a lady, for it is pitiable to con-

plate the inconvenience which neglect of it may entail. See that every article of clothing is removed from drawers and wardrobe; and do not from negligence leave half-a-dozen dresses hanging up in the latter, or an array of laces and fineries folded away in the former. Nothing can possibly be more conducive to the discomfort of a lady-guest than—just when she has bolted her door and has divested herself of her outer garments to dress for some dinner or dance—to have the hostess knock and bounce in, with: 'I beg your pardon; I know you won't mind me; but I find the dress I want to wear is in your wardrobe.' Or, 'My opera-mantle is stowed away in one of your drawers.'

I have occasionally stayed at houses, and very frequently at hotels, where there was no such thing in my room as a wardrobe at all, in any shape or form—not even a shelved press, or a clothes-rack on the wall. This is dire misery, and is an unpardonable omission on the part of those in authority over the management of affairs. It is not by any means a matter of necessity that a costly glass-pannelled wardrobe should be provided. Many households cannot afford such; but a neatly painted one is not an extravagance; and in the event of a narrow staircase or doorway preventing ingress to such a piece of furniture, there is an excellent plan for improvising a wardrobe, which I have seen tried with great success. Nail up a substantial clothes-rack in a recess of the room; suspend a brass rod across it, on which are curtains hung on rings, and cover in the top with strong calico, leaving a neat valance of the curtain-stuff, bordered with fringe, to hang over the edge. Any place, in short, which will allow of coats and dresses being hung up, to prevent the creasing which they suffer by folding, and to preserve them from dust, cannot fail to be acceptable to a visitor, when he or she comes to unpack.

Always make sure that the window-blinds are in perfect working order. They are at times too stiff, or too loose, or so much out of gear that if drawn down at night they remain immovable in the morning, and the guest is obliged to dress in semi-darkness. See, also, that the windows themselves are properly in order. Every window ought to be made to open both at top and bottom, as this admits of the immediate and thorough ventilation of the room. If, however, through defective carpentering in the first instance, the windows are hermetically sealed at the top—as is too frequently the case in old houses—make certain at all events that the lower sash opens and shuts with ease, and that when closed it does not admit a draught. Above all things, see that means are provided to prevent the shaking of windows in windy weather. Few things are so aggravating to the temper, and at the same time so wearying to the constitution, as being kept awake at night by the ceaseless and monotonous 'carg, hang' of a loose window-sash, which, after all, can be very easily remedied without adopting the old-fashioned method of thrusting a toothbrush handle or rack-comb between the sashes, to act as a sort of

wedge. Procure two neat flat pieces of wood, about four inches in length; drill a hole in the centre of each; affix one at each side of the window-frame with a screw, which you must not drive in too closely, but leave sufficient of the head for the wood to revolve or move upon. You will find that by slightly lifting the outer or lower end of the wood, the other end becomes pressed against the edge of the window-sash, which it holds perfectly steady; and that by declining or lowering this outer or lower end, the sash is released from pressure. The plan is an invention of my own; and I must not be considered egotistical for saying that it is an excellent one, as it will silence the noisiest window in an instant of time. A small bar of brass, treated in the same manner as the wood, looks more ornamental, and is of course stronger, where much pressure is desirable. Should there be any aperture or draught, a neat piece of cloth may be nailed along the sash, and will effectually exclude it.

Take especial care that the carpet does not wrinkle about the door, or in any other way prevent its shutting. I have seen some extremely awkward things occur from the neglect of this precaution. A relative of mine, who was of a very neat and systematic disposition, observed upon one occasion that there was a great crease in the carpet of his sitting-room at an hotel where he went to stay; and being of a practical turn of mind, he got out his own little hammer, and with the aid of a tack or two, soon set matters to rights. It happened, however, that the waiter was in the habit of overcoming difficulties by making a rush at the door; and as he followed this plan an hour later, when carrying in a heavy tray, the consequences were disastrous, for the door flew open with the greatest ease, and tray and waiter came tumbling into the room together.

You should make sure, also, that the bolt and lock of the door are in proper order. Many persons cannot sleep easily unless their door is fastened; and it is pleasant for the hostess to expend a few pence upon the mending of a lock or bolt, than to hear her guest, at dead of night, dragging a heavy box or table, or chest of drawers, or some other unwieldy thing, across the floor of the chamber, to barricade the door against imaginary disturbances.

Ascertain, likewise, that there are night-lights, matches, and a substantial taper left in the room—as also writing materials, pins, hair-pins—if the expected guest be a lady—perfume, and a few amusing magazines or other specimens of light literature, as well as the Book of books; for some persons waken early, and enjoy a brief spell of reading before getting up.

These may perhaps appear very minute details to go into, but believe me the chamber in which they have been thoroughly attended to—no matter how plain and unpretentious it may be—will prove infinitely more comfortable than the most luxuriously furnished room in which they have been overlooked.

It is an excellent plan, in a limited household, to have various matters connected with house-keeping in readiness before the guest arrives. A good supply of fresh table-napkins; a number

of knives, forks, and spoons arranged in a side-board drawer in the dining-room; a few plates and glasses within the locker, in order to obviate the necessity for continually ringing the bell; a supply of sweets made; and a good marketing laid in. Many persons deem this an impossibility in warm weather; but few things are so, if properly managed. There are many kinds of sweets that will keep good for days; even those in the manufacture of which milk has been employed, will not sour if the milk be first boiled and slightly flavoured, or if condensed milk be used in place of fresh. Of course, a great deal depends also upon keeping such things in a perfectly cool atmosphere.

With regard to meat, a joint may be preserved for many days by wrapping it loosely in a fine cloth wrung out of vinegar, and hanging it in a draught of air. If the weather be very warm, the cloth must be remoistened twice, or even thrice a day. Tinned provisions are excellent in summer, and are invaluable in cases of emergency; tongues, curries, and soups being amongst the best of the eatables thus preserved.

A breakfast-table, to be comfortably set, should have a separate tea or coffee equipage for each individual, except in cases where the family is very large; then one may be made to serve for two persons. In like manner, no dinner-table can be said to be properly appointed where there is any handing about of salt-cellars, water-bottles, or other necessities; nor can there be any excuse for it in these days of cheapness, when very neat little salt-cellars of moulded glass can be had for a penny apiece. I have even seen some as low as half that price and yet quite presentable.

Do not exercise your mind too much about amusing your guest. I have often thought that in some foreign countries, and notably in many parts of America, the relation of host and guest was a sort of double slavery. The host has the comfort and amusement of his guest so painfully at heart, that both undergo, for the time being, an amount of social misery that entirely spoils the freedom and pleasure of the visit. In our country it is different. Go to spend a week in an Englishman's house, and you may be sure that neither your host nor hostess will bother you with trifling matters unless you seem to desire it. Everything goes on as though you were not there, and yet, *per contra*, the house and its belongings are practically yours so long as you remain. I consider it the extreme of bad taste to pursue a visitor with continual offers of amusement. If treated as a member of the family and suffered to amuse himself, he will generally do very well, and will feel much happier and more at ease than when he is too closely looked after. I have heard persons complain bitterly of undue attentions and continual running after, from which they have suffered far more acutely than if actually neglected. 'Where is Mrs Dash? Who is sitting with her?' cries the hurried hostess. 'Good gracious! is it possible she has been left by herself? Go at once, Mary, or Julia, or Tommy, and sit with her, and amuse her until I have time to come.' And all the while, perhaps, the hapless Mrs Dash is struggling to get a letter or two written, or a bill or account made

up, and is congratulating herself upon the unwonted luxury of a few delicious moments of absolute quiet. She is revelling in the thought of being left alone, when, lo! Miss Mary, aged ten, comes awkwardly in, and stands sniffing in the window, or sits sideways upon the piano-stool, strumming with one hand at the notes, which is her idea of keeping the visitor company until mamma comes. Or Master Tommy, aged twelve, enters with a burst of noise, and proceeds to relate to the afflicted guest how he and Jack Jones are in the same Latin class; and how said Jones is beyond him in Euclid, though inferior in something else; and how Brown licked Black for calling him a dunce—with a variety of other information, by no means interesting to unconcerned parties. To this annoyance there are few of us who have not been subjected. A greater error of judgment can scarcely be committed. To make a guest feel comfortable and at home, leave him pretty much to his own devices. To be always striving to amuse him is a poor compliment to his own resources.

If in the winter-time a visitor comes to stay in your house, inquire early whether he prefers a fire in his bedroom at night, or a hot jar laid into the bed. If the latter, so much the better; it not only economises the coals, but is an immense saving of trouble to the housemaid in the mornings, as she has not then an additional grate to make up.

During the stay of your guest, if a lady, do not suffer her to pay anything towards the expenses of cabs, trains, or laundry, neither to defray the cost of her own concert or theatre tickets. Whilst in your house, she is, or ought to be, a member of your family, and it is not worth while, for the sake of a trifling additional outlay, to do anything which bears upon it the smallest stamp of meanness. If, however, the guest be a gentleman, there may—under certain circumstances—be some little relaxation of the rule; but where a lady is concerned, it cannot be too stringently adhered to.

Opinions vary as to the propriety of inviting a departing visitor to remain longer. The hostess should, I think, be guided by circumstances and surroundings. A lady cannot well press a gentleman to stay, unless he be a special friend or relative, or that it is her husband's desire that he should do so. It is, however, quite usual to ask a lady to extend her visit a few days beyond the time fixed by her for departure. Not to do so would appear in most cases inhospitable, or at all events coldly formal, which amounts to much the same thing. It is an excellent plan, however, when giving an invitation, to name the time that the recipient of it is intended to remain. 'We shall expect you to come to us for a fortnight;' or, 'Stay with us from Monday to Thursday;' will enable the guest to know precisely the limit to which his visit ought to be prolonged.

Make it a rule never to introduce any subject that could be unpleasant or embarrassing to a visitor. Avoid strictly the smallest allusion to household worries, as also questions of politics and religion; and if your household be, unhappily, one in which family jars are at times wont to figure, banish all such entirely out of view, for the

time at least, if not for all time, as nothing can possibly be more painful to a guest than witnessing bickerings upon subjects with which he has no sort of sympathy. A visitor, remember, can have but one feeling upon all such dreary occasions: namely, an intense desire to get well out of the way with all convenient speed.

Be careful, also, that your guest shall see nothing of your share of household duties or drudgery, otherwise he, or she, will be made to feel excessively uncomfortable. A hostess who presides over a limited establishment will have many duties to perform, and countless little matters to engage her attention and need her helping hand; but a visitor should not on any account be permitted to witness these things. A well-bred orderly hostess will get her work done quietly and without fuss, nor will she ever exhibit that bustling, anxious demeanour which is the characteristic of so many really kind and otherwise excellent entertainers.

It will not be out of place here to speak a warning word to ladies—mistresses of households—who allow their overwhelming anxiety respecting the success of the dinner preparations to appear on their countenances during the progress of the meal. Which of us is unfamiliar with the flushed face, eager eyes, and look of tortured suspense with which some hostesses regard the carrying in of the various dishes? I am now, of course, speaking of plain, old-fashioned family dinners, where the joints and sweets are laid upon the table. The hostess may be, and probably is, engaged in conversation with the guest who occupies the seat on her right or left hand, as the case may be; but the preoccupied manner, the wandering thoughts, the painful effort at appearing interested in whatever topic may be under discussion, are only too apparent—as are likewise the harassed look if, on the lifting of the covers, anything is discovered to be wrong, and the palpable look of relief if, on the other hand, there seems to be no reasonable ground for apprehension or complaint. All such facial reflexes of the soul can and ought to be avoided. They are frequently the result of nervousness, and are in such cases a misfortune, yet one which is quite curable and capable of being easily overcome. A hostess who cannot preserve her serenity upon even the most crucial occasions, is lacking in one of the most essential qualities of an entertainer. The thoughtless spilling of her best wine, the soiling of her whitest tablecloth, nay, even the smashing of a whole trayful of her best old family china, should not cause one muscle of her countenance to change.

On the other hand, an affected ignorance respecting the contents of the day's bill of fare is at times almost as fatal as the opposite extreme. I was myself present at a dinner-party at which one of the untutored stable-helpers had been brought in, on an emergency, to assist. 'What are these, John?' inquired the languid hostess, as John tremblingly thrust forward a dish of tartlets just under her right elbow. 'I don't know ma'am, really,' he replied; 'but I think they're tuppence apiece!'

I shall conclude this portion of my subject by remarking, that if a hostess has a lady-visitor in her house and does not keep a carriage, she ought, when the guest is about to depart, to

make arrangements that a cab or other vehicle shall be in waiting at the door in good time, to convey the visitor to train, boat, or whatever else may lead to her destination. Gentlemen are usually understood to see after such matters for themselves.

IN ALL SHADES.

BY GRANT ALLEN,

AUTHOR OF 'BABYLON,' 'STRANGE STORIES,' ETC. ETC.

CHAPTER XXIX.

In spite of his vigorous dislike for Tom Dupuy, Harry Noel continued to stop on at Orange Grove for some weeks together, retained there irresistibly by the potent spell of Nora's presence. He couldn't tear himself away from Nora. And Nora, too, though she could never conquer her instinctive prejudice against the dark young Englishman—a prejudice that seemed to be almost ingrained in her very nature—couldn't help feeling on her side, also, that it was very pleasant to have Harry Noel staying in the house with her; he was such a relief and change after Tom Dupuy and the other sugar-growing young gentlemen of Trinidad! He had some other ideas in his head beside vacuum pans and saccharometers and centrifugals; he could talk about something else besides the crop and the cutting and the boiling. Harry was careful not to recur for the present to the subject of their last conversation at Southampton; he left that important issue aside for a while, till Nora had time to make his acquaintance for herself afresh. A year had passed since she came to Trinidad; she might have changed her mind meanwhile. At nineteen or twenty, one's views often undergo a rapid expansion. In any case, it would be best to let her have a little time to get to know him better. In his own heart, Harry Noel had inklings of a certain not wholly unbecoming consciousness that he cut a very decent figure indeed in Nora's eyes, by the side of the awkward, sugar-growing young men of Trinidad.

One afternoon, a week or two later, he was out riding among the plains with Nora, attended behind by the negro groom, when they happened to pass the same corner where he had already met Louis Delgado. The old man was standing there again, cutlass in hand—the cutlass is the common agricultural implement and rural jack-of-all-trades of the West Indies, answering to plough, harrow, hoe, spade, reaping-hook, rake, and pruning-knife in England—and as Nora passed, he dropped her a grudging, half-satirical salutation, something between a bow and a courtesy, as is the primitive custom of the country.

'A very murderous-looking weapon, the thing that fellow's got in his hand,' Harry Noel said, in passing, to his pretty companion as they turned the corner. 'What on earth does he want to do with it, I wonder?'

'Oh, that!' Nora exclaimed carelessly, glancing back at it in an unconcerned fashion. 'That's only a cutlass. All our people work with cut-

lasses, you know. He's merely going to hoe up the canes with it.'

'Nasty things for the niggers to have in their hands, in case there should ever be any row in the island,' Harry murmured half aloud; for the sight of the wild-looking old man ran strangely in his head, and he couldn't help thinking to himself how much damage could easily be done by a sturdy negro with one of those rude and formidable weapons.

'Yes,' Nora answered with a childish laugh, 'those are just what they always hack us to pieces with, you know, whenever there comes a negro rising. Mr Hawthorn says there's very likely to be one soon. He thinks the negroes are ripe for rebellion. He knows more about them than any one else, you see; and he's thoroughly in the confidence of a great many of them, and he says they're almost all fearfully disaffected. That old man Delgado there, in particular—he's a shocking old man altogether. He hates papa and Tom Dupuy; and I believe if ever he got the chance, he'd cut every one of our throats in cold blood as soon as look at us.'

'I trust to goodness he won't get the chance, then,' Harry ejaculated earnestly. 'He seems a most uncivil, ill-conditioned, independent sort of a fellow altogether. I dropped my whip on the road by chance the very first afternoon I came here, and I asked this same man to pick it up for me; and, would you believe it, the old wretch wouldn't stoop to hand the thing to me; he told me I might just jump off my horse and pick it up for myself, if I wanted to get it! Now, you know, a labourer in England, though he's a white man like one's self, would never have dared to answer me that way. He'd have stooped down and picked it up instinctively, the moment he was asked to by any gentleman.'

'Mr Hawthorn says,' Nora answered, smiling, 'that our negroes here are a great deal more independent, and have a great deal more sense of freedom than English country-people, because they were emancipated straight off all in one day, and were told at once: "Now, from this time forth, you're every bit as free as your masters;" whereas the English peasants, he says, were never regularly emancipated at all, but only slowly and unconsciously came out of serfdom, so that there never was any one day when they felt to themselves that they had become freemen. I'm not quite sure whether that's exactly how he puts it, but I think it is. Anyhow, I know it's a fact that all one's negro women-servants out here are a great deal more independent and saucy than the white maids used to be over in England.'

'Independence,' Harry remarked, cracking his short whip with a sharp snap, 'is a very noble quality, considered in the abstract; but when it comes to taking it in the concrete, I should much prefer for my part not to have it in my own servants.'

(A sentiment, it may be observed in passing, by no means uncommon, even when not expressed, among people who make far more pretensions to democratic feeling than did Harry Noel.)

Louis Delgado, standing behind, and gazing with a malevolent gleam in his cold dark eyes after the retreating buckra figures, beckoned in

alliance with his skinny hand to the black groom, who came back immediately and unhesitatingly, as if in prompt obedience to some superior officer.

'You is number forty-tree, I tink,' the old man said, looking at the groom closely. 'Yes, yes, dat's your number. Tell me; you know who is dis buckra from Englan'?'

'Dem callin' him Mistah Noel, sah,' the black groom answered, touching the brim of his hat respectfully.

'Yes, yes, I know him name; I know dat already,' Delgado answered with an impatient gesture. 'But what I went to know is jest dis—can you find out for me from de house-serbants, or anybody up at Orange Grove, where him fader an' him mudder come from? I want to know all about him.'

'Missy Rosina find dat out for me,' the groom answered, grinning broadly. 'Missy Rosina is de young le-ady's waitin'-maid; an' de young le-ady, him tell Rosina pretty well eberyting. Rosina, she is Isaac Pourtales' new sweetheart.'

Delgado nodded in instantaneous acquiescence. 'All right, number forty-tree,' he answered, cutting him short carelessly. 'Ride after buckra, an' say no more about it. I get it all out ob him now, surely. I know Missy Rosina well, for true. I gih him de lub of Isaac Pourtales wit me obeeh, I tellin' you. Send Missy Rosina to me dis ebenin'. I has plenty ting I want to talk about wit her.'

OLD CITY TREES.

It might seem to many, at first sight, almost ludicrous to be directed to search for poetry in that most prosaic of all places, the Old City of London. The busy cry of 'commeree,' which all day long deafens the ear and deadens the finer senses, excludes all thoughts beyond those which tend to the discovery of the state of the various markets—the price of stocks, the rate of exchange at Paris, Berlin, or St Petersburg—the condition, in fact, of all the monetary and mercantile affairs in the world. Yet if these 'toilers' had a moment to spare, and would look around them and reflect, they would find that there are spots in the City which have inspired many a poet.

Starting for a 'walk down Fleet Street,' and entering at the Middle Temple gate, we come upon a scene which has been immortalised by Shakspeare—the scene of the original factions of York and Lancaster. In this garden, Plantagenet says:

'Since you are tongue-tied, and so loath to speak,
In dumb significance proclaim your thoughts:
Let him that is a true-born gentleman,
And stands upon the honour of his birth,
If he suppose that I have pleaded truth,
From off this briar pluck a white rose with me.'

To which Somerset replies:

'Let him that is no coward, nor no flatterer,
But dare maintain the party of the truth,
Pluck a red rose from off this thorn with me.'

In the background of this garden, with its fine

trees and flowers, where the great dramatist placed, in his imagination, this historical incident, may be seen the old walls and buttresses of the Middle Temple Hall. The descent into the garden is after the Italian fashion, from a court, in the centre of which stands that celebrated fountain of which nearly every noted author has spoken. Who does not remember Ruth Pinch—that devoted sister of Tom's, in *Martin Chuzzlewit*, walking under the trees in Fountain Court, and meeting there—by the merest accident, of course—her lover? 'Merrily the fountain leaped and danced, and merrily the smiling dimples twinkled and expanded more and more, until they broke into a laugh against the basin's rim, and vanished.' There is a graceful poem by L. E. L. (Miss Landon) on this much admired and petted fountain in the Temple Gardens:

The fountain's low singing is heard on the wind,
Like a melody bringing sweet fancies to mind:
Some to grieve, some to gladden; around them they
 cast
The hopes of the morrow, the dreams of the past.
Away in the distance is heard the vast sound
From the streets of the city that compass it round,
Like the echo of fountain's or ocean's deep call;
Yet the fountain's low singing is heard over all.

There is no place, one can see from reading Charles Lamb, which he loved more than the Temple to wander in. 'What a transition for a country-man visiting London for the first time,' he remarks in his *Essays*, 'the passing from the crowded Strand or Fleet Street by unexpected avenues, into its magnificent, ample squares, its classic green recesses.' . . . What a collegiate aspect has that fine Elizabethan hall, where the fountain plays, which I had made to rise and fall, how many times! Among the Temple trees there was formerly a colony of rooks, brought there by Sir Edward Northey, a well-known lawyer in the time of Queen Anne, from his house at Epsom. The thought had in it a touch of humour. The rook, both in his plumage as well as in his habits, is a legal bird: he is strongly addicted to discussions, lives in communities, and has altogether the grave appearance of a 'learned brother.' But these rooks have ceased to assemble in the Temple Gardens for many years.

For a long time, also, a favourite residence of rooks was that beautiful tree which still stands at the left-hand corner of Wood Street, on turning out of Cheapside. As late as 1845, two new nests were built there; and a trace of them is still visible. The spot where the tree stands marks the site of the church of St Peter-in-Cheap, a church destroyed by the Great Fire. The terms of the lease of the low houses at this west corner, with their frontage in Cheapside, did the erection of another story, it is said, or the removal of this tree. Is it possible that Wordsworth, passing one summer day down Cheapside, observed

the tree, and gained the inspiration which led to the *Reverie of Poor Susan*?

At the corner of Wood Street, when daylight appears,
Hangs a thrush that sings loud—it has sung for three
years;
Poor Susan has passed by the spot, and has heard
In the silence of morning the song of the bird.

'Tis a note of enchantment. What ails her? She sees
A mountain ascending, a vision of trees;
Bright volumes of vapour through Lothbury glide,
And a river flows on through the vale of Cheapside.

Within one of the inner courts of the Bank of England there is a garden tastefully planted with trees and shrubs, some of considerable age; and in the centre there springs forth a large fountain, mushroom-shaped, which plays during the office hours for the benefit of the clerks who inhabit that portion of the building, and for the 'toilers' who pass in and out with their bills of exchange and their bags of gold. The sparrows which congregate here flutter from branch to branch, twittering, 'as though they called to one another,' as Charles Dickens describes it, 'Let us play at country'; a place where 'a few feet of garden,' he says in *Edwin Drood*, 'enable them to do that refreshing violence to their tiny understandings.' This green spot, like many others still to be seen in the City of London, was once a churchyard; it belonged to the church of St Christopher in Threadneedle Street.

But one of the greenest spots in the City, although only a corner of it remains, is perhaps Drapers' Hall Gardens. It is shut in on all sides by newly constructed mansions, and only those who have business to transact among the stock-brokers, who have their offices in these buildings behind Throgmorton Street, have any suspicion of its existence. It may be reached by wandering through courts and alleys; it has almost a park-like appearance, if you are fortunate enough to gain a glimpse of it from an elevated and slightly distant point of view. Here there is also a fountain visible among the trees. But how different this garden once was! In the sixteenth century it was an estate, the property of Thomas Cromwell, Earl of Essex. It was purchased from him, in the reign of Henry VIII., by the Drapers' Company. The gardens then extended northwards as far as London Wall, and commanded a fine view of Highgate and the adjoining heights. In Ward's *London Spy*, it is spoken of as a fashionable promenade an hour before dinner-time.

In the neighbourhood of the Monument and of Thames Street, these gardens may be met with at nearly every turning by those who care to wander into nooks and corners in search of them. By walking up St Mary-at-Hill out of Thames Street, and entering through a narrow iron gateway with bars like a prison, above which may be seen in stone a grinning skull and crossbones, one comes upon some fine trees

with their branches extending overhead in the passage-way. Or, again, when descending St Dunstan's Hill, hard by, what is more beautiful in the City than the trees in the churchyard of St Dunstan, with the gray and black masonry of the church, against the green leaves, with its four lofty towers rising above?

To the account of the trees and gardens mentioned above may be added a short statement of many others existing in out-of-the-way nooks and corners within the boundary of the city of London. Many of the small open patches where these trees are found were once undoubtedly burial-grounds of churches, or the sites of churches long since taken down. After the beautiful grounds of the Temple, the only other large open spaces within the boundaries of the City are Finsbury Square, Finsbury Circus, Charterhouse Square, and Trinity Square. All these are well laid out with grass, shrubs, trees, and flowers, and are used as promenading places by the inhabitants. It should be here mentioned that the trees referred to in this notice are all young, or at most middle-aged, and that no such thing as a really 'old' tree exists anywhere within the City of London.

We will now continue our ramble, or tour of inspection; and starting from Temple Bar, we proceed eastward down Fleet Street. Here the first trees we notice are two or three small and sickly specimens growing in the churchyard of St Bride, Fleet Street; they are not very ornamental, or much to look at. Passing on up Ludgate Hill, St Paul's Cathedral is reached. The grounds round the church are prettily laid out, and contain many trees, but all young, small, and weedy. Just to the east of St Paul's, in Watling Street, is a little inclosure very neatly planted with shrubs only, and having in its midst a large square altar-tomb of some departed City worthy. This spot was once a burying-ground, or the site of a church long since removed. Proceeding eastward, and turning down Queen Street, just out of Cannon Street, two tall and rather fine plane-trees are observed growing in the front of a grand old mansion, once, of course, the residence of a City magnate, but now cut up and let out as offices. These planes are worthy of remark as affording one of the few instances now occurring of trees found in private grounds inside the City.

We now pass up Queen Street into Cheapside, and thence into Aldersgate Street. Here we find the ground, once the churchyard of St Botolph, Aldersgate, has been beautifully laid out as a garden, planted with trees, flowers, and shrubs, and furnished with numerous seats, and affording a delightful promenade or resting-place in summer-time, and is much enjoyed by the immediate neighbourhood. Another plot of ground, lying on the west, but belonging to Christ Church, Newgate Street, has also been planted and laid out; but, because it belongs to another parish, it is separated from the St Botolph's garden by a low wall and railing, although the two grounds actually adjoin.

Continuing our walk northward, we arrive at Charterhouse, once celebrated for its high-class school, which has now been removed into the

country. Adjoining, is Charterhouse Square, laid out with trees, shrubs, and grass like an ordinary London square, and surrounded by private dwellings. Returning south, and then going east, we reach St Alban's, Wood Street, which has a little ground round it, decorated with four trees and shrubs. Close by is St Mary-the-Virgin, Aldermanbury, with four trees round it. Just beyond is a small churchyard that once belonged to St Mary, Staining, containing two trees and shrubs; and a little farther is St Olave, Jewry, with six trees and shrubs, all weedy and sickly.

Passing on into Cannon Street, we turn down Lawrance Poultney Hill, where we discover a disguised burial-ground, with a public passage-way passing through the midst of it. The plot is planted with eighteen sickly-looking, weedy trees, large and small, as well as some stunted shrubs. Passing over King William Street, we reach the top of Lombard Street, where one little sickly-looking tree is seen in front of the church of St Mary Woolnoth. Continuing down Lombard Street, and turning to the right, we come upon the disguised burial-ground of St Nicholas Acon, situated in Nicholas Lane. This little plot is very neatly laid out with shrubs, and planted with three small trees. Passing on into King William Street, we ultimately reach London Bridge, where, close by in Thames Street, we find the large church of St Magnus-the-Martyr, with its tall and peculiar tower and spire, near the Monument. It has no churchyard, but a small inclosed space round it contains a dozen unhealthy-looking young trees. A little beyond this, close to the church of St Mary-at-Hill, three trees are observed growing in what is apparently the private ground or garden in the rear of a dwelling-house. A few minutes farther east, we come to the fine church of St Dunstan-in-the-East, standing in the midst of a well-kept churchyard, and having ten goodly young trees, of fair height and girth, which always have a very agreeable appearance in the summer-time. Still farther on east, we come to St Olave, Hart Street, with its little churchyard, planted with ten small trees; and close by we see the church of Allhallows (Barking), Tower Street. This fine old church is one of the few which escaped the great fire of 1666. It stands in a roomy churchyard, decorated with twenty-four trees, and having somewhat the appearance of a village church and churchyard.

We now emerge into one of the most interesting spots in all London, interesting not only in an historical sense, but peculiarly so from the terrible tragedies of which it was so constantly the theatre—namely, Tower Hill. This vast space, extending from the Tower gates northward to the Trinity House, was once entirely open; but now a small portion of its northern extremity is inclosed and neatly planted with grass, shrubs, and trees. As the Tower itself is situated outside the City boundaries, we must not include its trees and plantations in this notice, which strictly applies to trees in the City only. We therefore turn our steps westward; and in a little court, leading from Mark Lane to Fenchurch Street, called Star Alley, we come on a curious relic of the past, a gray medieval church tower, square in shape, with its stair turret at one corner, which once belonged to the church of Allhallows (Staining),

Mark Lane. The nave of the church has long since been removed, and the small plot of ground round the old tower is now prettily laid out with six young trees, many shrubs, yuccas, and other ornamental plants.

Threading our way to Bishopsgate Street, we find the churchyard of St Botolph, through which a public footway leads to a neighbouring street. The ground, right and left, is tastefully laid out as a garden with pretty shrubs and trees, the effect being pleasing and agreeable, especially in summer. Nearly opposite is the ancient church of St Ethelburga, hidden behind the houses, with a small confined space at the back, in which are fine trees. Two or three more trees are found in a small inclosure in the vicinity at the back of this church. Close by is also the curious and interesting church of St Helen, Bishopsgate, and in the great round it are four ill-looking, scraggy trees.

Returning southward, and reaching Cornhill, we find a little burial-ground in the rear of the fine church of St Michael, Cornhill, neatly laid out, and planted with three small trees. Close by is another large church, St Peter-upon-Cornhill, with its small confined churchyard, also neatly laid out, and planted with two small unhealthy-looking trees.

Taking our way westward, we pass Christ's Hospital in Newgate Street. The boys' playground is a large open paved courtyard, destitute of grass, trees, or shrubs; but in the private gardens in the rear, trees, shrubs, and flowers are to be found, having a pleasant appearance. A little way beyond, we find St Andrew's, Holborn, and in the open churchyard surrounding the church are many trees, but not much cultivation. Passing through the quaint old gateway, we find ourselves in the interior of Staple Inn, Holborn, with its Hall and gardens. The latter are neatly laid out with grass, shrubs, and trees, and carefully kept, affording a quiet retreat from the noise and racket of Holborn during the bright days of summer.

In conclusion, it may perhaps be worthy of remark that nearly all the places referred to are very small indeed, mere 'garden nooks'; some are churchyards surrounding churches; and for these reasons, apparently, none of them are open for the use of the public as places of recreation, except the cultivated churchyards of St Paul's Cathedral, and St Botolph, Aldersgate, close by; and the squares of Finsbury, Trinity, and Charterhouse, which are open to the immediate residents. St Botolph, Bishopsgate, has, as already stated, a footway through its prettily laid out churchyard.

It is at least remarkable how trees will suddenly appear in the City in the most out-of-the-way corners, where a green leaf would be about the last thing looked for; yet such is the case, as it has already been shown. There are two sickly, scraggy, young trees in a little court, up a narrow dirty lane, on the south side of St Paul's Cathedral, and at Stationers' Hall, where no one would dream of looking for vegetation; and two or three more in Barnard's Inn, Holborn, an inn devoted to law and lawyers. The peculiar character of 'City trees' in nearly all cases, is that they are lanky, thin, and generally poor and unhealthy looking. It is rare,

indeed, to find a tall, well-grown tree in any of these odd nooks and corners of the old City; perhaps the three finest in size and height are two plane-trees in front of a private house—now used as offices—in Queen Street, Chopside; and the well-known single tree at the corner of Wood Street, Chopside; but these instances are few and far between.

TREASURE TROVE.

A STORY IN FOUR CHAPTERS.—CHAP. I.

SAINT QUINIANS—that quaint little town which nestles in a valley close by the cruel, tumbling North Sea—looked forward, sixty years ago, to market-day as the one weekly break in the monotony of its existence, just as it does now. On Wednesdays, Saint Quinians became the centre to which active life converged from a score of villages and hamlets that regarded it as their metropolis. Wednesday was a point in the calendar upon which hinged all arrangements, and by which all events were calculated: people met upon Wednesday who never saw each other at any other time; and the news of Wednesday was the latest obtainable by many folk even at an epoch when forty coaches left London every evening. And if Saint Quinians' shopkeepers looked forward to Wednesday as their busy day—if the farmers looked forward to it as the link which bound them with the outer world—if the local youth saved up their money and their spirits, and let them both out on Wednesday, Bertha West, who lived with her father in a solitary house on the shore, some four miles from the town, looked forward to it as the day when she met her sweetheart, Harry Symonds, and spent the happiest hours of her week. Every Wednesday, Harry Symonds met her at the old South Gate—the only one remaining to tell of days when Saint Quinians was a port of some fame, and contributed its quota of ships and men to the national navy—and if she was prevented from coming, a very miserable week was in store for the young man, as John West, the father of Bertha, did not approve of the attachment, for the rather selfish reason, that if his daughter married, he was left alone in the world.

They had been sweethearts in this semi-clandestine manner for more than a year, and Harry Symonds was beginning to face mentally the awkward problem of what was to be done, should the old man persist in his opposition to the match. Not only this; but the young man was aware that the pretty girl whom he had learned to regard as his own inalienable private property was the object of very marked attention on the part of a certain Jasper Rodley, a youth who bore no very high character in the town, who had suddenly disappeared from it for three years, and had as unexpectedly returned; and although Harry trusted Bertha implicitly, he thought that a settlement of affairs would be an advisable step. And so when, one bright spring Wednesday morning, he met the girl coming with her market baskets on her arm along the path over the sandhills, she observed that his face was serious, and very naturally

jumped at the conclusion that something was wrong.

'Why, Harry,' she exclaimed, 'there's a face for a lover to make who sees his sweetheart only once a week! There's nothing wrong, is there?'

'No, dear,' replied the young man, his face instantly brightening at the sound of her voice; 'there's nothing wrong. I've been thinking, that's all. And how are matters at home? How's the father?'

'Just as usual, Harry. Father's been depressed all the week; but I've got him to set to work on his flagstaff and battery with two real guns, so that he'll be all right.'

'I wonder what depresses him?' asked Harry. 'You've always described him as such a jovial old seadog.'

'I don't know; but ever since the *Fancy Lass* was wrecked, he's been different at times.'

'And Mr Rodley—has he been annoying you with any of his attentions lately?' asked Harry.

'No. But I've seen him more than once about our house.'

'How did he find out where you lived? And what is he doing there?'

Bertha shook her head, and said: 'I don't know. I seem to think that there has been some acquaintance formed between father and him. He has never been inside the house, to my knowledge; but I fancy they meet now and then.'

The young man was silent for a few moments; then he continued: 'Well, never mind, Bertha. So long as we are true to each other, he cannot come between us. He's a queer fellow, and people say odd things about him. If you remember, he disappeared from Saint Quinians about the same time that my sad business with the bank took place.'

'You mean, when the bank's sovereigns were stolen, and you were dismissed for cul—cul—What was it, Harry?'

'Culpable negligence, my dear.'

'Yes, that was it; and a great shame it was!' cried the girl warmly. 'I wonder where the sovereigns went to?'

'Ah! where indeed?' asked Harry. 'They were never traced. But old Cusack, our cashier, who disappeared with them, took good care that they never should be traced. It's my belief that they went to sea, for three thousand pounds in sovereigns are not carried away so easily. However, after all, it did me no harm. Every one agreed that I was cruelly treated. I got a new berth immediately; and I'm much better off now than I should have been if I'd remained in the bank's service; so well off, in fact, Bertha, that I'm beginning to think it almost time for us to come to some decision as to what we shall do.'

'O Harry! there's plenty of time to think about that; and it's—it's so pleasant making love; and besides, I must break it gently to father, for he has no idea of parting with me yet.'

'But he surely can't expect that you should spend your life in that tumble-down old smuggler's cottage.—Hillo! there's Rodley, skulking about like a whipped cur. We'll go on.'

So the happy pair proceeded into the market,

Harry holding the girl's baskets whilst she made her usual purchases, until the clock striking ten warned the young man that he was due at his office. He saw Bertha on her road home as far as the South Gate, and was hurrying across the market-place, when he caught sight of Jasper Rodley walking swiftly in the direction taken by Bertha. He stopped and watched. He saw Rodley catch the girl up just as she was disappearing beneath the archway, raise his hat, and continue by her side in spite of Bertha's evident annoyance. Harry Symonds retraced his steps so far that he could watch the progress of the pair out of the town. Suddenly, he observed Mr Rodley attempt to put his arms round Bertha's waist, whereupon the girl struggled, got free, and ran on.

This was too much for Harry. He ran out by the gate, and, coming up to Bertha and her tormentor, said to him: 'Mr Rodley, what do you mean by daring to force your attentions where they are not wanted?'

Jasper Rodley, a tall, well-built young fellow, of about Harry's age and size, started at first; but, shoving his hands into his pockets, surveyed his questioner for a moment with disdain, and asked: 'And what has that to do with you, Mr Dismissed Bank-clerk?'

Harry was itching to thrash him on the spot; but respect for Bertha's presence induced him to bottle up his wrath as best he could, and reply: 'You've no right to bother any girl if she doesn't want to have anything to do with you. And look here—your character hereabouts isn't so high that you can afford to call other people names, so I warn you to keep a civil tongue in your head, or something might be done that you wouldn't like, and something might be said that would make you look a little small.'

This last bit was added at random, but it seemed to have a strange effect upon Rodley, who turned pale for a moment, but recovered himself and retorted: 'Done and said, indeed! You couldn't do much that I'm afraid of, and at any rate people couldn't say of me what they do of you. How about these sovereigns, eh?'

'Look here, Rodley. If I did my duty, I should give you a thrashing on the spot. Just be off.—Miss West is betrothed to me. That's enough. Do you hear?'

Jasper Rodley walked off, with a savage scowl on his face and an imprecation on his lips.

'O Harry dear!' cried the girl, who was trembling with fright, 'I'm so glad you didn't fight.'

'Fight with a cur like that!' exclaimed Harry. 'Men of his kidney don't fight.—What has he been saying to you, my darling?'

'Oh, such terrible things, Harry! He says that he will marry me whether I like it or not—that father is in his power, and has consented; and that I had better make up my mind to give you up before it is too late.'

'Why, what on earth can he mean? Your father in the power of a rascal like that—to consent to your marrying him! He's only trying to frighten you. And yet you say that you have seen him with your father. I think I shall tackle Mr Jasper at once and make him explain his dark speeches. There's one thing—I'm not going to have him continue his tormenting of

you, whether your father is in his power or not.—And now, good-bye, dearest; you're safe now.'

So the girl pursued her homeward road; and Harry Symonds walked rapidly back into the town. Just within the gate, he came up with Jasper Rodley. 'Rodley,' he said, 'I'm going to the office to give an excuse for my absence. Kindly wait here until I come back, as I want to speak to you.'

'If you want to speak to me, you'd better do so at once; I've other things to attend to, and I'm not going to hang about here waiting for you.'

'Very well, then,' said Harry; 'let's go where people can't remark us. Here, we'll turn on to the ramparts.'

So they went along the pleasant walk which ran upon what had been, in old, stirring times, the walls of Saint Quinians, a broad path, bounded by shrubs and trees on one side, and by the deep stony ditch on the other.

'I want an explanation from you,' said Harry, 'about what you have just said to Miss West concerning her father being in your power and your determination to marry her.'

'That's easily given,' replied Rodley. 'At a word from me, old Captain West could be ruined and disgraced. I'm as much in love with Bertha—'

'Miss West, if you please.'

'I said "Bertha," and I repeat it,' continued Rodley. 'I'm as much in love with her as you are, and I intend to marry her. If I can't marry her, I ruin her father.'

'How can you ruin him?'

'It's very likely I should tell you—isn't it?' answered Rodley with a sneer.

'I intend to find out.'

'Very well then, find out,' retorted Rodley.—'And now I must be off.'

'You don't go until I have an explanation,' cried Harry. 'I don't believe a word of what you say, and I believe you are only trying to terrify the poor girl into submission.'

'Come now, Symonds, don't be a fool; we're men of the world, and it's time we understood one another. I tell you once and for all, if Bertha West does not marry me, I'll have her father up in the felon's dock.—There; I've said more than I intended, so good-morning.'

He endeavoured to push past Harry; but the latter harried the way, saying: 'You'll have poor old Captain West up as a felon! Why, man, you're mad! A simple old man like that, who never stirs beyond his garden, who never said an evil thing of any one, much less did a wrong to any one! Come, be more explicit.'

'I've said more than I intended,' continued Rodley; 'and you don't get another word out of me.'

Again he tried to get past Harry, and again Harry prevented him, saying: 'Neither of us shall budge from here until I find out more about this.'

Rodley made a desperate effort to get past Harry. The two men struggled together, and as they were evenly matched in weight and strength, the issue was doubtful. Suddenly, Rodley loosened his hold of Harry's arms, stooped, caught him by the legs, and jerked him

over the steep side of the rampart. Harry fell heavily, struck a projecting mass of stone half-way down, and rolled amongst the sharp stones and rubbish at the bottom, where he lay motionless and bleeding. Rodley did not stop to look after him, but walked rapidly back into the town.

TRIAL BY ORDEAL.

ONE of the most remarkable judicial systems of olden times was the trial by ordeal, a mode of procedure founded on the presumption that, should a person be wrongfully accused, heaven would interpose, and in some marked way make his innocence undeniable. With the exception of China, this test was of almost universal adoption in the middle ages; and, whilst still surviving amongst the uneducated portion of most civilised communities, is even nowadays largely practised by uncultured races. As far as its origin is concerned, it may be traced back to remote antiquity; and the bitter water by which conjugal infidelity was revealed—an ordeal pure and simple—will readily occur to the biblical student as an interesting instance in Hebrew legislation and history. Herodotus relates how King Amasis—whose reign immediately preceded the invasion of Cambyse—was, when a private person, fond of drinking and jesting, and by no means inclined to serious business. As soon, however, as means failed him for the indulgence of his amusements, he used to go about pilfering; and such persons as accused him of having stolen their property—on his denying it—were wont to take him to the oracle of the place, where he was oftentimes convicted, and occasionally acquitted. The Greeks had their ordeals, a good illustration of which occurs in the *Antigone* of Sophocles, where the soldiers offer to prove their innocence in various ways:

Ready with hands to bear the red-hot iron,
To pass through fire, and by the gods to swear,
That we nor did the deed, nor do we know
Who counselled it, nor who performed it.

This mode of purgation, the scholiast tells us, was in common use at that time.

There was also the water ordeal, and a certain fountain near Ephesus was specially employed for this purpose. As soon as the accused had sworn to her innocence, she entered the water with a tablet affixed to her neck, on which was inscribed her oath. If she were innocent, the water remained stationary; but if guilty, it gradually rose until the tablet floated. Traces of the same system are to be met with in the history of ancient Rome; and amongst notable instances may be quoted that of the vestal Tucca, who proved her purity by carrying water in a sieve; and that of Claudia Quinta, who cleared her character by dragging a ship against the current of the Tiber, after it had run aground, and resisted every effort made to remove it. But, as Mr Lea points out in his essay on

The Ordeal, 'instances such as these had no influence on the forms and principles of Roman jurisprudence, which was based on reason, and not on superstition. With the exception of the use of torture, the accused was not required to exculpate himself. He was presumed to be innocent, and the burden of proof lay not on him, but on the prosecutor.'

The ordeal trial prevailed in France from before the time of Charlemagne down to the eleventh century. The ancient Germans, too, were in the habit of resorting to divination; and their superstitious notions, writes Mr Gibson, led them to invent many methods of purgation or trial now unknown to the law. It should be added, also, that the Germans were specially tardy in throwing off this relic of barbarism; for, at a period when most vulgar ordeals were falling into disuse, the nobles of Southern Germany established the water ordeal as the mode of deciding doubtful claims on fiefs; and in Northern Germany it was instituted for the settlement of conflicting titles on land. Indeed, as recently as the commencement of the present century, the populace of Hela, near Danzig, twice plunged into the sea, an old woman, reputed to be a sorceress, who, on persistently rising to the surface, was pronounced guilty, and beaten to death. Grotius mentions many instances of water ordeal in Bithynia, Sardinia, and other countries, having been in use in Iceland from a very early period.

In the primitive jurisprudence of Russia, ordeal, by boiling water, was enjoined in cases of minor importance; and in the eleventh century we find burning iron ordered 'where the matter at stake amounted to more than half a grivna of gold.' A curious survival of ordeal superstition still prevails to a very large extent in Southern Russia. When a theft is committed in a household, the servants are summoned together, and a sorceress is sent for. Should no confession be made by the guilty party, the sorceress rolls up as many little balls of bread as there are suspected persons present. She then takes one of these balls, and addressing the nearest servant, uses this formula: 'If you have committed the theft, the ball will sink to the bottom of the vase; but if you are innocent, it will float on the water.' The accuracy of this trial, however, is seldom tested, as the guilty person invariably confesses before his turn arrives to undergo the ordeal.

Again, in Spain, trial by ordeal was largely practised; and it may be remembered how, during the pontificate of Gregory VII., it was debated whether the Gregorian ritual or the Mozarabic ritual contained the form of worship most acceptable to the Deity. When the chance of deciding this contest amicably seemed hopeless, the nobles resolved to arrange the controversy in their customary manner, and, according to the historian Robertson, the champions—one chosen by either side—met and fought. But in the year 1322, in Castile and Leon, the Council of Palencia

threatened with excommunication all concerned in administering the ordeal of fire or water—a circumstance which is important, as pointing to the disappearance of this mode of trial in Spain.

Furthermore, the practice of trial by ordeal was under the Danish kings substituted for the trial by combat, which, until the close of the ninth century, had been resorted to among the Danes for the detection of guilt and the acquittal of innocence. In Sweden, says Mr Gibson, the clergy 'presided at the trial by ordeal; and it was performed only in the sanctuary, or in the presence of ministers of the church, and according to a solemn ritual.' And yet, as he rightly observes, its abolition in Europe was due to the continued remonstrances of the clergy themselves. One form of ordeal practised in Sweden was popularly known as the *trius tærn*, and consisted in the accused carrying a red-hot iron, and depositing it in a hole twelve paces from the starting-point. In accordance with the accustomed mode of procedure, the accused fasted on bread and water on Monday and Tuesday, the ordeal being held on Wednesday, previous to which the hand or foot was washed. It was then allowed to touch nothing until it came in contact with the iron, after which it was wrapped up and sealed until Saturday, when it was opened in the presence of the accuser and the judges.

In the years 1815 and 1816, Belgium, says Mr Lea, was disgraced by ordeal trials performed on unfortunate persons suspected of witchcraft; and in 1728, in Hungary, thirteen persons suspected of a similar offence were, by order of the court, subjected to the ordeal of cold water, and then to that of the balance. Referring to the ordeal of the balance, Mr Tylor informs us that the use of the Bible as a counterpoise is on record as recently as 1759, at Aylesbury in this country, where one Susannah Haynoke, accused of witchcraft, was formally weighed against the Bible in the parish church. In Lombardy, ordeal by hot water was a form of procedure much resorted to; and in Burgundy this was also supplemented by the trial by hot iron.

The instances thus quoted show how universally practised throughout Europe in bygone years was the trial by ordeal; and if we would still see it employed with the enthusiastic faith of the middle ages, we must turn to eastern countries, where, owing to the slow advance of civilisation, many of their institutions still retain their primitive form. Indeed, as Mr Isaac Disraeli remarks, 'ordeal is the rude law of a barbarous people who have not yet obtained a written code, and not advanced enough in civilisation to enter into the refined inquiries, the subtle distinctions, and elaborate investigations which a court of law demands.' This is specially true in the case of India at the present day, where the same ordeals are practised as were in use five or six centuries ago. Thus, the guilt or innocence of an accused person is still tested by his 'ability to carry red-hot iron, to plunge his hand unhurt in boiling oil, to pass through fire, to remain under water, to swallow consecrated rice, to drink water in which an idol has been immersed, and by various other forms

which retain their hold on public veneration.' Professor Monier Williams, too, says that trial by ordeal is recognised by the code of Manu, and quotes the subjoined rules: 'Let him cause a man (whose veracity is doubted) to take hold of fire, or dive under water, or touch the head of his wife and sons one by one. The man whom flaming fire burns not and water forces not up, and who suffers no harm, must be instantly held innocent of perjury.'

In Japan, ordeals extensively prevail; and amongst the many superstitious practices kept up, we are told how the 'goo'—a paper inscribed with certain cabalistic characters—is rolled up and swallowed by an accused person, this being commonly supposed to give him no internal rest, if guilty, until he confesses. A similar mode of procedure is practised by the Siamese, and under a variety of forms was prevalent in former years. With it, too, we may compare the mouthful of rice taken by all of a suspected household in India, which the thief's nervous fear often prevents him from swallowing.

Formerly, this practice was observed in our own country with the corned or trial-slice of consecrated bread or cheese. Even now, says Mr Tylor, peasants have not forgotten the old formula: 'May this bit choke me if I lie.'

In Tibet, a popular ordeal consists in both plaintiff and defendant thrusting their arms into a caldron of boiling water containing a black and white stone, victory being assigned to the one who is fortunate enough to obtain the white. Such an even-handed mode of procedure, if generally used, must, as Mr Lea remarks, 'exert a powerful influence in repressing litigation.'

Among further curious specimens of ordeal trial mentioned by this author may be noticed those in use in certain parts of Africa. Thus, the Kalabarese draw a white and black line on the skull of a chimpanzee, which is then held up before the accused, 'when an attraction of the white line towards him indicates his innocence, or an inclination of the black towards him pronounces his guilt.' In Madagascar, a decoction of the nut of the Tangena—a deadly poison—is administered to the accused. If it act as an emetic, this is considered a proof of innocence; but if it fail to do so, the guilt of the accused is confirmed. Dr Livingstone describes a similar ordeal as practised in Africa, and tells us how 'when a man suspects that any of his wives have bewitched him, he sends for the witch-doctor, and all the wives go forth into the field, and remain fasting till that person has made an infusion of the plant called "fobo." They all drink it, each one holding up her hand to heaven in attestation of her innocence. Those who vomit it are considered innocent; but those whom it purges are pronounced guilty, and put to death by burning. The innocent return to their homes, and slaughter a cock, as a thank-offering to their guardian spirits.'

It should be noted, too, that such modes of trial have been introduced with much effect into mediæval poetry and romance. Thus, says Mr Gibson, 'there was the mantle mentioned in a ballad of which Queen Guenevere is the principal heroine, and which is supposed to have suggested to Spenser his conceit of Florimel's girdle.'

Lastly, as far as our own country is concerned, trial by ordeal existed from a very early period. When the Anglo-Saxons were unable to decide as to the guilt of an accused person, they invariably resorted to this test, the law requiring that the accuser should swear that he believed the accused to be guilty, and that his oath should be supported by a number of friends who swore to their belief in his statement and to his general truthfulness. Trials of this kind, however, were often fraudulently conducted. Thus, when William Rufus caused forty Englishmen of good quality and fortune to be tried by the ordeal of hot iron, they all escaped unhurt, and were acquitted. But upon this the king declared that he would try them by his own oath. According to the legendary account, it was by this mode of ordeal that Queen Emma, the mother of Edward the Confessor, was tried in order to clear her character from the imputation of an intrigue with Alwyn, Bishop of Winchester. Then there was the ordeal known as the 'corncod', or noisel of excretion, already alluded to, which consisted of a piece of bread, weighing about an ounce, being given to the accused person, that, if he were guilty, it might cause convulsions and paleness and find no passage; but turn to health and nourishment if he were innocent. The sudden and fatal appeal to this trial by Godwin, Earl of Kent, in the year 1053, when accused of the murder of Ælfred, the brother of Edward the Confessor, ranks amongst the most curious traditions of English history. Hallam relates how 'a citizen of London, suspected of murder, having failed in the ordeal of cold water, was hanged by order of Henry II., though he had offered five hundred marks to save his life. It appears as if the ordeal were permitted to persons already convicted by the verdict of a jury.'

Ordeals were abolished in England about the commencement of Henry III.'s reign. An edict dated January 27, 1219, directs the judges then starting on their circuits to employ other modes of proof, 'seeing that the judgment of fire and water is forbidden by the Church of Rome.' Matthew Paris, enumerating the notable occurrences of the first half of the thirteenth century, alludes to the disuse of the ordeal. But it was no easy matter to root out such a deep-rooted superstition, instances of which were of constant occurrence. Thus, the belief that the wounds of a murdered person would bleed afresh at the approach, or touch, of the murderer long retained its hold on the popular mind; and in a note to the *Fair Maid of Perth*, we are told how this bleeding of a corpse was urged as an evidence of guilt in the High Court of Justiciary at Edinburgh as late as the year 1668. An interesting survival of this notion still exists in the north of England, where we are told that 'touching of the corpse by those who come to look at it is still expected by the poor who visit their house while a dead body is lying in it, in token that they wished no ill to the departed, and were in peace and amity with him.'

Another of the few ordeals that still linger in popular memory may be seen occasionally in some country village, where persons suspected of theft are made to hold a Bible hanging to a key, which is supposed to turn in the hands of the thief—a survival of the old classic and medieval

ordeal described in *Hudibras* as 'th' oracle of sieve and shears, that turns as certain as the spheres.' But instances of this kind are mostly confined to the uncultured part of the community, for, happily, ordeals have long since had their day, and are now discarded from the laws of the more civilised nations.

A NORMAN STRONGHOLD.

THE lover of antiquity may well lament when he sees our ancient fortresses nearly levelled to the ground; but the friend of rational freedom will rejoice, when he reflects on the design for which such works were erected, and on the many calamities to which they have given occasion. Amongst the existing but dismantled and ruined fortresses connecting the present with the sanguinary scene of strife and bloodshed of the past, is the famous castle of Pontefract, in Yorkshire, which sustained two memorable sieges by Cromwell's soldiery. This celebrated edifice is supposed to be of Saxon origin; and the site of it is perfectly agreeable to their mode of fortification. While the Romans formed their camps on a plain or on the level ground, and defended them by a fosse and a vallum, the Saxons raised the area of their camps and castles, if the ground was level, or selected hills as places best adapted for defence and security. The elevated rock on which the castle is built stands wholly insulated, forming a site which, without much trouble or expense, might soon be converted into a stronghold. In support of the theory as to its Saxon origin, it may be mentioned that, since the demolition of the castle, it has been found that the great round tower stood upon a raised hill of stiff hard clay, of which material the Saxons usually made their foundations.

After the Conquest, Ilbert de Lacy received a grant of the place, and about 1076, all his vast possessions being confirmed to him, he soon after began to erect the castle. This noble structure cost immense expenso and labour, and no one, unless in possession of a princely revenue, could have completed it. This formidable structure and magnificent palace was carried forward for the space of twelve years with unremitting attention. Ilbert de Lacy, when he laid the foundation stone of the castle, gave it the name of Pontfretre, because the situation, as he conceived, resembled the place so called in Normandy where he was born. Historians, however, have differed much respecting the origin of the name. Thomas de Castleford, who was bred a Benedictine monk, and who wrote the history of this place, accounts for it by the following miracle. William, Archbishop of York, and son of the sister of King Stephen, returning from Rome, was met by such crowds of people desirous to see him and receive his blessing, that a wooden bridge over the river Aire, near to this place, gave way and broke down, by which accident vast numbers fell into the river. The

bishop, affected at the danger of so many persons, is said to have prayed with such fervour and success that no one perished. To perpetuate so striking and so signal a miracle, the pious Normans, says Thomas, gave the name of Pontefract or Broken-bridge to this place.

The tower of York minster, distant upwards of twenty miles, is distinctly visible from this elevated rock. The situation of the castle contributed greatly to its strength, and rendered it almost impregnable. It was not surrounded by any contiguous hills, and the only way it could be taken was by blockade. The staterooms of the castle were large, and accommodated with offices suitable for the residence of a prince. The style of the building shows it to be Norman; though it has received various additions and improvements of a later date.

The barbican was situated on the west side of the outer yard beyond the main guard. Barbicans were watch-towers, meant for the accommodation of the outer guard and for the protection of the main entrance to the castle. They were sometimes advanced beyond the ditch, to which they were joined by drawbridges. The north side of the barbican area was formed by the south wall of the hallum or castle-yard, in the centre of which was the porter's lodge, the grand entrance into the yard of the castle. The whole of this area was sometimes called the barbican, and within it stood the king's stables and a large barn. A deep moat was cut on the west side of the castle. Within the wall of the ballium or great castle-yard were the lodgings and barracks for the garrison and artificers, the chapel of St Clement, and the magazine. The magazine is cut out of a rock, the descent to which is by a passage four feet wide, with forty-three steps to the bottom. Near this place was a large dungeon, the entrance to which was at the seventeenth step of the passage, and was a yard in breadth; but it is now stopped up by the falling-in of the ruins. The wall, as you descend these steps, is inscribed with many names. The entrance into the hallum was usually through a strong machicolated and embattled gate between the two towers, secured by a herse or portcullis. Over this were the rooms intended for the porter of the castle. The towers served for the *corps de garde*. On an eminence at the western extremity of the ballium stood the keep or donjon, called the Round Tower. It was the citadel or last retreat of the garrison. The walls of this edifice were always of an extraordinary thickness, and having in consequence withstood the united injuries of time and weather, now remain more perfect than any other part of the castle. Here on the second story were the staterooms for the governor. The lights were admitted by small chinks, which answered the double purpose of windows, and served for embrasures whence the defenders might shoot with long and cross bows. The different stories were frequently vaulted and divided by strong arches; on the top was generally a platform with an embattled parapet, whence the garrison could see and command the exterior works.

Tradition says Richard II. was confined and murdered here by a blow with a battleaxe from

Sir Piers Exton. Fabian and Rapin inform us 'that on Richard's arrival at Pontefract Castle, Sir Piers Exton is related to have murdered the king in the following manner. On the king's arrival at the castle, he was closely confined in the great tower. Soon after, Sir Piers Exton, a domestic of Henry's, was sent down with eight ruffians to imbrue their hands with the blood of this unfortunate king. On the day of their arrival, Richard perceived at dinner that the victuals were not tasted as usual. He asked the reason of the taster; and upon his telling him that Exton had brought an order against it, the king took up a knife and struck him on the face. Exton with his eight attendants entered his chamber at that instant, and shutting the door, attempted to lay hold of Richard. He immediately perceived their fatal errand, and knew he was a lost man. With a noble resolution, he snatched a halbert or poleaxe from the foremost of them and defended himself so bravely that he slew four of his assailants. Whilst combating with the rest of the murderers, Exton got upon a chair behind him, and, with a poleaxe, discharged such a blow on his head as laid him down at his feet, where the miserable king ended his calamities.' Stow says 'that the most probable opinion is that he was starved to death by order of King Henry IV., suffering the most unheard-of cruelties, keeping him for fifteen days together in hunger, thirst, and cold, before he reached the end of his miseries.'

Henry IV., after his accession to the throne, and during the whole of his reign, honoured the castle at Pontefract, the paternal residence of his family, by his frequent residence. Many stato documents were dated from this castle. After the battle of Shrewsbury, in which fell the valiant Hotspur and near six thousand of the rebels, the king marched to Pontefract, to watch the motions of the Scots and the Earl of Northumberland. He granted full power to certain persons to treat with the king of Scotland, in a document which is dated at Pontefract Castle, August 6, 1403. These and other similar acts of the king and many of his successors originated in this celebrated castle. Lord Rivers, Sir Richard Grey, and Sir Thomas Vaughan, were executed in this fortress in the reign of Edward V.

The castle of Pontefract was the only one that held out against the parliament in the reign of Charles I. The garrison long and obstinately maintained themselves against the overwhelming numbers of the besieging army under Fairfax, until famine and reduced numbers compelled them to capitulate. Great and numerous were the deeds of heroism and daring displayed in their sallies against their foes, who in more than one encounter were put to rout. The besiegers, seeing no prospects of taking the castle by the breach they had made, began to mine, in order to blow up some of the towers. On the discovery of this, the garrison sank several pits within the castle, and commenced their mines from them. The number of pits within and without the castle is said to have been above a hundred. No great advance was made against the brave defenders, even by the arrival of Cromwell himself, who adopted every measure to compel them to surrender the fortress. On the 30th of January 1649, Charles was beheaded. The

news of this event had no sooner reached the garrison, than they loyally proclaimed his son, Charles II. But the want of provisions and the hopelessness of relief were stronger than the enemy, and towards the end of March the garrison walked out of the castle. In compliance with an order, the fortress was dismantled, and rendered wholly untenable for the future. General Lambert, to whom the execution of this order was intrusted, soon rendered this stately and princely stronghold a heap of ruins. The buildings were unroofed, and all the valuable materials sold.

Thus fell this castle, which had successively been the stronghold of the brave and warlike Saxons, the residence of a proud and imperious Norman conqueror, the turreted seat of the high aspiring Dukes of Lancaster, the palace of princes and of kings, at some periods a nest of treachery and rebellion, and at others the last hope of vanquished royalty.

SOME SIMILES.

'THE child of the past and the parent of the future,' is not an unhappy simile for the—present. Happiness has been likened to a ghost; all talk about it, but few, if any, have ever seen it. Ambition's ladder rests against a star, remarks a clever writer, who also tells us that a proverb is a short truth sandwiched between wit and wisdom.

Eloquence is a coat of many colours judiciously blended. No one thing will make a man eloquent. Flattery has been termed a kind of had money to which our vanity gives currency. Society, like shaded silk, must be viewed in all situations, or its colours will deceive us. Kindness is the golden chain by which society is bound together; and charity is an angel breathing on riches; while graves have been poetically called the footsteps of angels.

Language is a slippery thing to deal with, as some may find when selecting their similes. Says a writer: 'Speak of a man's marble brow, and he will glow with conscious pride; but allude to his wooden head, and he's mad in a minute.' The young lecturer's 'similes were gathered in a heap' when he expressed the whole body of his argument on Deceit in the following: 'O my brethren, the snowiest shirt-front may conceal an aching bosom, and the stiffest of all collars encircle a throat that has many a bitter pill to swallow.'

Plagiariats are a species of purloiners who filch the fruit that others have gathered, and then throw away or attempt to destroy the basket.

It has been truly said that the abilities of man must fall short on one side or other, like too scanty a blanket when you are in bed: if you pull it upon your shoulders, you leave your feet bare; if you thrust it down upon your feet, your shoulders are uncovered. The man, we are told, who has not anything to boast of but his illustrious ancestors, is like a potato—the only good belonging to him being undergrowth.

A man at a dinner in evening dress has been likened to a conundrum: you can't tell whether he is a waiter or a guest. A Yankee, describing a lean opponent, said: 'That man doesn't amount to a sum in arithmetic; add him up, and there's nothing to carry.' An American critic in reviewing a poem, said: 'The rhythm sounds like turnips rolling over a barn-floor, while some lines appear to have been measured with a yard-stick, and others with a ten-foot pole.'

An amusing illustration was given by a parent when asked by his boy, 'What is understood by experimental and natural philosophy?' The answer was: 'If any one wants to borrow money, that is experimental philosophy. If the other man knocks him down, that is natural philosophy.' Curious and comical illustrations seem natural to many children. A little girl, suffering from the mumps, declared she felt as though a headache had slipped down into her neck. 'Mamma,' said another youngster, alluding to a man whose neck was a series of great rolls of flesh, 'that man's got a double-chin on the back of his neck.' A little three-year-old, in admiring her baby brother, is said to have exclaimed: 'He's got a boiled head, like papa.'

Talking of curious similes—among the southern languages of India is the Telooogo or Telinga, so rough in pronunciation that a traveller of the nation speaking it before a ruler of Bokhara, admitted that its sound resembled 'the tossing of a lot of pebbles in a sack.' A simile for scarlet stockings is firehose—laughter is the sound you hear when your hat blows off—and trying to do business without advertising is said to be 'like winking at a girl in the dark.' An unpoetical Yankee has described ladies' lips as the glowing gateway of beans, pork, sauer-kraut, and potatoes. This would provoke Marryat's exclamation of, 'Such a metaphor I never met afore.' Much more complimentary was the old darkey's neat reply to a beautiful young lady whom he offered to lift over the gutter, and who insisted she was too heavy. 'Lor, missy,' said he, 'I've used to lifting barrels of sugar.' Wit from a man's mouth is like a mouse in a hole; you may watch the hole all day, and no mouse come out; but hy-and-hy, when no one is looking for it, out pops the mouse and streams across the parlour.

Marrying a woman for her money, says a philosopher, is very much like setting a rat-trap and baiting it with your own finger.

An American writer says: 'A man with one idea always puts me in mind of an old goose trying to hatch out a paving-stone.' An editor's simile of man's career is summed up in the lines: 'Man's a vapour full of woes, starts a paper, busts, and goes.'

We all recollect how the Bath waters were associated in Weller's mind with the 'flavour of warm flat-irons.' The humorist who created that character was often reminded of a printer's parenthesis by the appearance of a bow-legged child, and the elongated pupils of a cat's eyes before a bright light were likened by him to 'two notes of admiration.'

Just as children call a locomotive 'a puff-puff,' savages will use sounding similes to supply the lack of language. The war-rockets sent amongst the Abantes soon became known as 'ehoo-shoo,' to describe their hissing; and we have heard that a battlefield firing shell was referred to by some of the Zulus as a 'boom-byby,' the first representing the report of the gun, the second the explosion of the projectile.

To touch on the poetic and romantic style of similes. Moore, if we rightly recollect, sings of 'rose-leaves steeped in milk' as a simile for a beautiful complexion. One of the gallant poets of France wrote of Mary Queen of Scots that her complexion was 'clear as a white egg with a blush on it;' and it certainly is probable that Elizabeth was as jealous of Mary's wonderful complexion as of her claims to the English throne. Beauty has been called a solitary kingdom. Another writer says: 'The red, white, and blue—the red cheeks, white teeth, and blue eyes of a lovely girl are as good a flag as a young soldier in the battle of life can fight for.' A German poet refers to a fishing-rod as being typical of a young girl. He says: 'The eyes are the hooks, the smile the bait, the lover the gudgeon, and marriage the hutter in which he is fried.' Matrimony has been well likened to a harque in which two souls venture forth upon life's stormy sea with only their own frail help to aid them; the well-doing of their craft rests with themselves.

A French wit of a post-office turn of mind evolves the following: 'A married woman is a letter which has reached its address. A young girl is a letter not yet addressed.'

Home has been described as the rainbow of life. A laughing philosopher once, in a moral lecture, compared human life to a table pierced with a number of holes, each of which has a peg made exactly to fit it, but which pegs, being stuck in hastily and without selection, chance leads inevitably to the most awkward mistakes; 'for how often do we see,' the orator pathetically concluded—'how often do we see the round man stuck in the three-cornered hole!' Sir Walter Scott, who alludes to this simile, says: 'This new illustration of the vagaries of fortune set the audience into convulsions of laughter, excepting one fat alderman, who seemed to make the case his own, and insisted that it was no jesting matter.'

PROCESSIONARY CATERPILLARS.

In the month of February, these 'processionary caterpillars'—as they have come to be called—are seen in large numbers both at Archacon and Biarritz. Sometimes chains of two and three hundred may be observed marching in solemn procession either on the *plage* or on the roads. It is clearly seen that they choose the smooth paths of life, as they are rarely, if ever, seen to perambulate the sandy, uneven forest, from which they emerge throughout the whole day. Not infrequently, they mount the steps of a villa, to take a peep at the interior, to the dismay of travellers unaccustomed to such extraordinary, though perfectly harmless callers. On such occasions they divide into small detachments, as if to ensure that the presence of a whole battalion was inconvenient; for at other times,

whatever be the length of the chain, or how oft soever divided, they invariably unite, and the one who starts as leader retains the post, as if by common consent, until their return to the nests they have left in the early morning. Alas! for the fruit-trees that fall in their way on what may be termed their foraging expeditions. They halt many times to regale themselves on succulent leaves, and when fully satisfied, return to their nests in the evening. These nests are longitudinal in form, similar to those of wasps, but smaller. They are composed of the dry needle-points of the pine, divided into minute particles; and are ingeniously woven together by gossamer threads as fine as those of the spider, but in appearance so silky as to resemble the work of the silkworm. As it covers the whole nest, the intention is evidently to keep the fabric together. Should any one, impelled by curiosity, attempt to pull the nest to pieces, to discover more of this texture, and afterwards touch his own eyes, inflammation may set in, and even death ensue. This enables us to understand how injurious so virulent a poison must be to the young trees. Many of large growth in the forest of Archacon have been completely destroyed by these insects. They are never seen during the great heat of summer. In mid-winter, they leave the nests by shoals, unite, and burrow in the earth. There, underground, the long chain forms itself into a ball, and many of the caterpillars die. After a time, the rest emerge from their cocoon existence, and return to the trees, where they make fresh nests on the deserted ones of the preceding year.

BY THE RIVER.

We met at morning by the willowed river,
Long years ago, when both our hearts were young!
We met to watch the lights and shadows quiver,
And listen to the song the waters sung.
But deeper than the music of its flowing,
The tide of love flowed on from mind to mind;
While overhead the elder blooms were blowing,
And dewy fragrance filled the wooing wind.

We stand beside the waters of the river,
But now the moaning of the sea is near!
Far off the beacons 'mid the dimness quiver,
And rolling breakers fill our hearts with fear.
No longer choristers of morning greet us,
Or blossoms of the May-time droop above;
But shadows of the twilight rise to meet us,
And cloud the golden harvesting of love.

Ah! listen to the rushing of the river
Towards its haven in the restless sea,
While like a leaf upon its tide for ever
Our life flows onward to Eternity.
Oh, 'mid its eager tumult and commotion,
This whirl of waters, and the dash of foam,
May Love, the beacon, shining o'er the ocean,
Lead us together to our Father's home!

LIFE IN MARS.

THE question as to the habitability of other worlds than ours has always been a very fascinating one, and, indeed, it is not surprising that it is so; for since the days when the earth was debased from her proud position as centre of the universe, and was assigned her proper place among the planets, there seemed to be no particular reason why she alone should produce life, and why other planets, apparently as suitable for this purpose as she is, should wander uninhabited through space.

Up to the present time, it must be confessed, we have met with nothing but disappointment in this branch of inquiry; for not only have we not detected living creatures on any other member of the solar system, but, with the single exception we are considering, there is apparently no other body whose surface is under conditions which would lead us to suppose that it might support life, or at least life in any form with which we are acquainted. It is of course useless to argue about the possibility of life under entirely different conditions; for instance, there might be some form of life on the sun; we can only say that it would be so different from what we know as life, that the term would be hardly applicable; and whether it is likely to exist or not, is a question which our limited experience does not allow us to answer one way or the other.

The moon, again, may be the home of living creatures; but they must be so constituted as to exist without air of any sort, which is rather contrary to our notions of life.

We will not here go to the length of examining in detail the conditions which obtain on the surface of all the bodies within range of our telescopes; but we may state that in none of them, with the exception of the planet Mars, is there any resemblance to our earth, and therefore life as we know it could not exist on them. With Mars, the case is different, and at first sight, there appears to be a state of things which approximates closely to that which obtains here. The planet Mars appears to the naked eye a deep red colour,

and when examined with the telescope, we see that a large part of his surface is red; but between the red, and intersecting it in all directions, are patches and strips of a dull greenish hue. It was very soon conjectured that this green part was the Martial sea, and that the red was the land: this has been confirmed by later observations, and now no doubt exists on the point. The principal problem that we are here confronted with is this: assuming that what appears green on Mars is a liquid of some sort, can we assume that it is water, and not some other liquid with which perhaps we are unacquainted? This question appears at first sight impossible; for, unless we can bring some of the Martial sea down to the earth and analyse it, how can we determine its chemical constitution? The telescope evidently will not help us here, and we must call to our aid that powerful ally of the telescope—the spectroscope.

The method of observation employed is a question which we cannot enter into here; it must suffice to state results, which all tend to prove that these seas are composed of water similar to ours. It must not be understood that we have been able to determine this directly; the only fact that we know for certain about it is, that in the Martial atmosphere there is a considerable quantity of water-vapour, which it is only fair to assume has been raised by evaporation from the seas, which are therefore also water.

Some time ago, it was observed that situated at each pole of Mars there is a white patch, which increases and decreases at regular intervals. This had been observed for many years before the explanation was suggested by Herschel, that it was due to the freezing of the sea, and was exactly analogous to our Arctic and Antarctic Oceans. If this was true, the patch of ice would of course decrease in the Martial summer, and increase again as the winter came on. This was soon shown to be the fact. Thus we see that as far as regards the sea, Mars is very similar to our earth, with the exception, that the proportion of land is much larger. On the earth, the land is only about one-third of the area of the sea; while

on Mars, the land and sea surfaces seem to be about equal in extent. The land is much cut up by the water, which exists not so much in the form of a few large oceans, but rather as a number of curious-shaped narrow inlets and channels, which intersect the continents in all directions. The bright red colour of the land is a curious fact, for which no adequate explanation has as yet been suggested. Herschel considered it was due to the peculiar nature of the soil; but it certainly seems curious that in this point Mars should differ from all the other planets. The appearance of the earth seen from a similar distance would probably be a dirty green, or perhaps brown. In fact, on the earth we have no soil or rock, which occurs in any quantity, of the red colour which we observe on Mars. There is therefore no vegetation, unless we adopt the curious theory, advanced by a French savant, that in Mars the foliage is red. Unluckily, we have no instrument that can at all help us here; the telescope and spectroscope are alike useless, and, for the present, we must content ourselves with vain conjectures.

The next point that ought to engage our attention is the atmosphere, without which no life is possible. The method we use to determine whether a planet has an atmosphere is a very simple one: we have only to observe it pass in front of a fixed star; then, if there is no air round it, the light from the star will be extinguished instantaneously, as it is in the case of the moon; whereas, if it has an atmosphere, the light will gradually die away; because, instead of being cut off suddenly by an opaque body, it will be slowly diminished by the increasing thickness of the air that it is viewed through, and will very likely have entirely disappeared before the actual body of the planet is interposed. By applying this observation to Mars, it has been determined that it has an atmosphere, the exact thickness of which, however, we are unable to measure. It seems fair to assume that the amount of air which surrounds it is about the same proportion to the total mass of the planet as in the case of the earth. Without entering into calculations, we may state that if this is true, the pressure of the air at the surface of Mars would be about equal to five inches of mercury, or about one-sixth of the normal atmospheric pressure on the earth.

Now, given an atmosphere and a large extent of sea, we should naturally expect that clouds would form a prominent feature on the Martian surface; and observation has proved this to be the case. On several occasions, some of the features of the planet have been observed to be obscured by a sort of white film, which it is only fair to assume was a cloud. These clouds appear more markedly at the edge of the disc, or at those points where it would be morning or evening, and we may therefore assume that, similar to the earth, Mars is liable to mists or clouds forming at dawn and in the evening. It has

been suggested that these white films are due not to clouds in the air, but to a deposition of snow on the surface, which disappears when the sun rises. There seems to be no particular reason for adopting this theory; it does not explain the observed phenomena better, nor does it seem more likely to be true.

The air on Mars being very much less dense than on the earth, it is presumable that the winds would move with much greater velocity; and for this reason, it has been thought that trees could not grow to any considerable height. We must, however, bear in mind that though the velocity would be high, the actual force of the wind would probably not be very great, on account of its excessive tenuity.

In an inquiry as to the probability of the existence of life, one of the most important points to be taken into account is the amount of heat available. Now, Mars is at such a distance from the sun that on the whole it would receive about two-fifths as much solar heat as we do. This does not, however, give the amount of heat that is actually received on the surface of the planet, a considerable proportion being absorbed by the atmosphere; and since our atmosphere is so much denser and thicker than that of Mars, it follows that we lose a much larger percentage of the solar heat. To calculate the exact amount of heat absorbed by a given thickness of air is a very difficult, if not impossible, problem; but it seems likely that, taking everything into account, the inhabitant of Mars will receive more heat from the sun than we do. This would have the effect of making the evaporation very large, and if so, the Martian atmosphere would be mostly composed of water-vapour.

According to Professor Langley, the true colour of the sun is blue; and its yellowness is due to the dirt always present in the air. To the inhabitants of Mars, it would most probably appear nearly white, unless, indeed, they also have volcanoes to fill the air with lava-dust.

Let us now sum up the facts we have stated, and determine as far as we can what sort of man the inhabitant of Mars must be.

In the first place, the force of gravitation at the surface is only just over one-third of its equivalent on the earth; a pound would therefore weigh about six ounces in Mars. If, therefore, we assume that the men are of such a size that their weight and activity are the same as ours, they would be about fourteen feet high on the average. This would make their strength very great; for not only would it be actually superior to ours, but, as every weight is so much smaller, it would be apparently proportionally increased. We should, therefore, expect to find that the Martians have executed large engineering works; perhaps also their telescopes are much superior to ours, and we have been objects of interest for their observers. With regard to telescopes, it may be interesting to examine what is the effect of the highest magnifying power we can use. At his nearest approach, the distance from us to Mars is about thirty-seven million miles; and assuming that the highest power that can be used with advantage is twelve

hundred, we approach with our telescopes to a distance of thirty thousand miles, so that houses, or towns, or indeed any artificial works, would be hopelessly invisible. With regard to the supply of heat and light, we have seen that the Martialite is not worse off than we are. To him the sun would appear as a white, or perhaps blue disc about two-thirds of the diameter that it appears to us. The Martial day differs but slightly from ours; his year, however, is much longer, being about six hundred and eighty-seven of our days, which is about six hundred and fifty Martial days. The inclination of his axis to the plane of the orbit is such that his seasons would be very similar to ours. It is difficult to reconcile the idea of an extensive vegetation with his peculiar red colour; it is just possible, however, that some of the green patches, generally supposed to be seas, may in reality be large forests.

The most valid objection to the habitability of Mars lies in the fact of the extremely low atmospheric pressure, which, as we have seen, would probably average about five inches of mercury. The lowest pressure that a man has ever lived in, even for a short time, is about seven inches, which was reached by Coxwell and Glaisher in their famous balloon ascent. The aeronauts, however, narrowly escaped perishing, not only on account of the low pressure, but also because of the extreme cold.

It seems impossible that a man constituted exactly as we are could live for any length of time breathing air only one-sixth of the density of ours. But it is rather going out of our way to assume that the Martialites would be exactly the same as we are in every way; the chances are a million to one against it; and on the other hand, a very slight modification of the lung arrangement would suffice to make life perfectly possible under such conditions.

The nights on Mars would be very dark, for he has no satellite like our moon. He has, it is true, two moons, but they are so small that their illuminating power is nil, being respectively only sixty and forty miles in diameter. The smallest of these presents the curious phenomenon that it revolves round Mars faster than the planet turns on his own axis, and therefore would appear to rise in the west and set in the east.

Our earth, as seen from Mars, when at his nearest, would appear about the same size as Jupiter does to us; that is to say, would subtend an angle of about forty seconds. At his furthest distance, this would be reduced to fourteen.

We thus see that there is ample reason for assuming that this, the most interesting of all the planets, is the abode of creatures not essentially different from ourselves. Being considerably older than we are, the Martialites are probably much further advanced in the arts and sciences; and perhaps there may be some truth in the story of the Italian astronomer who says he has lately detected lights on the planet moving about in such a way as seems to indicate a deliberate intention to open communication with the earth. What the language of the lights is, we have not been informed; let us hope it is something more practical than the proposal of the

Russian savant to communicate with the moon by cutting a huge figure of the forty-seventh proposition of Euclid on the plains of Siberia, which, he said, any fool would understand.

IN ALL SHADES.

CHAPTER XXX.

THAT evening, Rosina Fleming went as she was bid to the old African's tent about half-past eleven, groping her way along the black moonless roads in fear and trembling, with infinite terror of the all-pervading and utterly ghastly West Indian ghosts or duppies. It was a fearful thing to go at that time of night to the hut of an oleah man; heaven knows what grinning, gibbering ghouls and phantoms one might chance to come across in such a place at such an hour. But it would have been more fearful still to stop away; for Delgado, who could so easily bring her Isaac Pourtales for a lover by his powerful spells, could just as easily burn her to powder with his thunder and lightning, or send the awful duppies to torment her in her bed, as she lay awake trembling through the night-watches. So poor Rosina groped her way fearfully round to Delgado's hut with wild misgivings, and lifted the latch with quivering fingers, when she heard its owner's gruff, 'Come in den, missy,' echoing grimly from the inner recesses.

When she opened the door, however, she was somewhat relieved to find within a paraffin lamp burning brightly; and in place of ghouls or ghosts or duppies, Isaac Pourtales himself, jauntily seated smoking a fresh tobacco-leaf cigarette of his own manufacture, in the corner of the hut where Louis Delgado was sitting cross-legged on the mud floor.

'Ebenin', missy,' Delgado said, rising with African politeness to greet her; while the brown Barbadian, without moving from his seat, allowed his lady-love to stoop down of herself to kiss him affectionately. 'I send for you dis ebenin' because we want to know suffi' about dis pusson dat callin' himself bukra, an' stoppin' now at Orange Grobe wit you. What you know about him, tell us dat, missy. Yon is Missy Dupuy own serbin'-leady: him gwine to tell you all him secret. What you know about dis pusson Noel?'

Thus adjured, Rosina Fleming, sitting down awkwardly on the side of the rude wooden settee, and with her big white eyes fixed abstractedly upon the grinning skull that decorated the bare mud wall just opposite her, pulled her turban straight upon her woolly locks with coquetish precision, and sticking one finger up to her mouth like a country child, began to pour forth all she could remember of the Orange Grove servants' gossip about Harry Noel. Delgado listened impatiently to the long recital without ever for a moment trying to interrupt her; for long experience had taught him the lesson that little was to be got out of his fellow-countrywomen by deliberate cross-questioning, but a great deal by allowing them quietly to tell their own stories at full length in their own rambling, childish fashion.

At last, when Rosina, with eyes kept always timidly askance, half the time upon the frightful

skull, and half the time on Isaac Pourtales, had fairly come to the end of her tether, the old African ventured, with tentative cunning, to put a leading question: 'You ebber hear dem say at de table, missy, who him mudder and fader is, and where dem come from?'

'Him fader is very great gentleman ober in Englan', Rosina answered confidently—'very grand gentleman, wit house an' serbant, an' coach an' horses, an' plinty cane-piece, an' rum an' sugar, an' yam garden an' plantain, becasse I 'member Aunt Clemmy say so; an' de missy him say so himself too, sah. An' de missy say dat de pnsion dat marry him will be real le-ady—same like ds gubbernor le-ady; real le-ady, like dem hab in Englan'. De missy tellin' me all about him dis here ebenin'.'

Delgado smiled. 'Den de missy in lub wit him himself, for certain,' he answered with true African shrewdness and cynicism. 'Ole-time folk has proverb, "When naygur woman say, "Dat fowl fat," him gwine to steal him same ebenin' for him pickany dinner." An' when le-ady tell you what happen to gal dat marry gentleman, him want to hab de gentleman himself for him own husband.'

'O no, sah; dat 'Joan't so,' Rosina cried with sudden energy. 'De missy don't lubbin' de buckra gentleman at all. She tell me him look altogether too much like naygur.'

Delgado and Pourtales exchanged meaning looks with one another, but neither of them answered a word to Rosina.

'An' him mudder?' Delgado inquired curiously after a moment's pause, taking a lazy puff at a cigarette which Isaac handed him.

'Him mudder?' Rosina said. 'Ah, dere now, I forgettin' clean what Uncle 'Zekiel, him what is butler up to do house dar, an' hear dem talk wit one anoder at dinner—I forgettin' cleau what it was him tell me about him mudder.'

Delgado did not urge her to rack her feeble little memory on this important question, but waited silently, with consummate prudence, till she should think of it herself and come out with it spontaneously.

'Ha, dere now,' Rosina cried at last, after a minute or two of vacant and steady staring at this orbesse cyeholes of the skull opposite; 'I is too chupid—too chupid altogether. Mistab 'Zekiel, him tellin' me de odder marnin' dat Mistah Noel's mudder is le-ady from Barbadoes.—Dat whar you come from youself, Isaac, me fren'. You must be 'memberin' de family ober in Barbadoes.'

'How dem call de family?' Isaac asked cautiously. 'You ebber hear, Rosie, how dem call de family? Tell me, dar is good girl, an' I gwine to inh you better'n ebber.'

Rosina hesitated, and cudgelled her poor brains eagerly a few minutes longer; then another happy flash of recollection came across her suddenly like an inspiration, and she cried out in a joyous tone: 'Yes, yes; I got him now, I got him now, Isaac! Him mudder family deir name is Budleigh, an' dem lib at place dem call de Wilderness. Mistah 'Zekiel tell me all about dem. Him say dat dis le-ady, what him name Missy Budleigh, marry de buckra gentleman fader, what him name Sir-waltah Noel.'

It was an enormous and unprecedented fetch

of memory for a pure-blooded black woman, and Rosina Fleming was justly proud of it. She stood there grinning and smiling from ear to ear, so that even the skull upon the wall opposite was simply nowhere in the competition.

Delgado turned breathlessly to Isaac Pourtales. 'You know dis family?' he asked with eager anticipation. 'You ebber hear ob dem? You larn at all whedder dem is buckra or only b'row people?'

Louis Delgado laughed hoarsely. Brown man as he was himself, he chuckled and hugged himself with sardonic delight over the anticipated humiliation of a fellow brown man who thought himself a genuine buckra.

'Know dem, sah!' Isaac cried in a perfect ecstasy of malicious humour—'know de Budleighs ob de Wild-ness! I tink for true I know dem! He! Mistah Delgado, me fren', I tellin' von de trut, sah; me own mudder an' Mrs Budleigh ob de Wilderness is first-cousin, first-cousin to one anudder.'

It was perfectly true. Strange as such a relationship sounds to English ears, in the West Indies cases of the sort are as common as earthquakes. In many a cultivated light-brown family, where the young ladies of the household, pretty and well educated, expect and hope to marry an English officer of good connections, the visitor knows that, in some small room or other of the back premises, there still lingers on feebly an old black hag, wrinkled and toothless, full of strange oaths and incomprehensible African jargons, who is nevertheless the grandmother of the proud and handsome girls, busy over Mendelssohn's sonatas and the *Saturday Review*, in the front drawing-room. Into such a family it was that Sir Walter Noel, head of the great Lincolnshire house, had actually married. The Budleighs of the Wilderness had migrated to England before the abolition of slavery, when the future Lady Noel was still a baby; and getting easily into good society in London, had only been known as West Indian proprietors in those old days when to be a West Indian proprietor was still equivalent to wealth and prosperity, not, as now, to poverty and bankruptcy.

Strange to say, too, Lady Noel herself was not by any means so dark as her son Harry. The Lincolnshire Noels belonged themselves to the black-haired type so common in their county; and the union of the two strains had produced in Harry a complexion several degrees more swarthy than that of either of his handsome parents. In England, nobody would ever have noticed this little peculiarity; they merely said that Harry was the very image of the old Noel family portraits; but in Trinidad, where the abiding traces of negro blood are so familiarly known and so carefully looked for, it was almost impossible for him to pass a single day without his partially black descent being immediately suspected. He had 'thrown back,' as the colonists coarsely phrase it, to the dusky complexion of his quadron ancestors.

Louis Delgado hugged himself and grinned at this glorious discovery. 'Ha, ha!' he cried, rocking himself rapidly to and fro in a perfect frenzy of gratified vindictiveness; 'him don't buckra, den!—him don't buckra! He hold himself so proud, an' look down on naygur; an'

after all, him doan't huckra, him only brown man! De Lard be praise, I gwine to humble him! I gwine to let him know him doan't huckra!

'You will tell him?' Rosina Fleming asked curiously.

Delgado danced about the hut in a wild ecstasy, with his fingers snapping about in every direction, like the half-tamed African savage that he really was. 'Tell him, Missy Rosie!' he echoed contemptuously—'tell him, you sayin' to me! Yah, yah! you hab no sense, missy. I doan't gwine to tell him, for certain; I gwine to tell dat cheatin' scoundrel, Tom Dupuy, missy, so humble him in de end de wuas for all dat.'

Rosina gazed at him in puzzled bewilderment. 'Tom Dupuy!' she repeated slowly. 'You gwine to tell Tom Dupuy, you say, Mistah Delgado! What de debbel de use, I wonder, sah, ob tell Tom Dupuy dat de huckra gentleman an' Isaac is own cousin?'

Delgado executed another frantic *pas de seul* across the floor of the hut, to work off his mad excitement, and then answered gleefully: 'Ha, ha, Missy Rosie, you is woman, you is ercole naygur gal—you doan't under-tan de depth an' de wisdom ob African naygur. Look you here, me fren', I explain you all about it. De missy up at house, him fall in lub wit dis brown man, Noel. Tom Dupuy, him want for go an' marry de missy. Dat make Tom Dupuy hate de brown man. I tell him, Noel doan't no huckra—him common brown man, own cousin to Isaac Pourtales. Den Tom Dupuy laugh at Noel! Ha, ha! I turn de hand ob one proud huckra to bring down de pride ob de older!'

Isaac Pourtales laughed too. 'Ha, ha!' he cried, 'him is proud huckra, an' him is me own cousin! I bate him!'

Rosina gazed at her mulatto lover in rueful silence. She liked the English stranger—he had given her a shilling one day to post a letter for him—but still, she daren't go back upon Isaac and Louis Delgado. 'Him is fren' ob Mistah Hawthorn,' she murmured apologetically at last after a minute's severe reflection—'great fren' ob Mistah Hawthorn. Dem is old-time fren' in Englan' togelder; and when Mistah Tom Dupuy speak bout Mistah Hawthorn, Mistah Noel him flare up like angry naygur, an' him gib him de lie, an' him speak out well for him!'

Delgado checked himself, and looked closely at the hesitating negress with more deliberation. 'Him is fren' ob Mistah Hawthorn,' he said in a meditative voice—'him is fren' ob Mistah Hawthorn! De fren' ob de Lord's fren' shall come to no harm. I gwine to tell Tom Dupuy. I must humble de huckra. But in de great an' terrible day, dem shall not hurt a hair of him head, if de Lard wills it.' And then he added somewhat louder, in his own sonorous and mystic Arabic: 'The effendi's brother is dear to Allah even as the good effendi himself is.'

Isaac Pourtales made a wry face aside to himself. Evidently he had settled in his own mind that whatever might be Delgado's private opinion about the friends of the Lord's friend, he himself was not going to be bound, when the moment for action actually arrived, by anybody else's ideas of promises.

By-and-by, Rosina rose to go. 'You is comin' wit me, Isaac?' she asked coquettishly, with

her finger stuck once more in coy reserve at the corner of her mouth, and her head a little on one side, bewitching negress fashion.

Isaac hesitated; it does not do for a brown man to be too condescending and familiar with a nigger girl, even if she does happen to be his sweetheart. Besides, Delgado signed to him with his withered finger that he wanted him to stop a few minutes longer. 'No, Missy Rosie,' the mulatto answered, yawning quietly; 'I doan't gwine yet. You know de road to house, I tink. Ebenin', le-ady.'

Rosina gave a sighing, sidelong look of disappointed affection, took her lover's hand a little coldly in her own black fingers, and sidled out of the hut with much reluctance, half-frightened still at the horrid prospect of once more facing alone the irrepressible and ubiquitous ghouls.

As soon as she was fairly out of earshot, Louis Delgado approached at once close to the mulatto's ear and murmured in a mysterious hollow undertone: 'Next Wednesday.'

The mulatto started. 'So soon as dat!' he cried. 'Den you has got de pistols?'

Delgado, with his wrinkled finger placed upon his lip, moved stealthily to a corner of his hut, and slowly opened a chest, occupied on the top by his mouldy obeah mummery of loose alligators' teeth and well-cleaned little human knuckle-bones. Carefully removing this superstitious rubbish from the top of the box with an undisguised sneer—for Isaac as a brown man was *ex officio* superior to obeah—he took from beneath it a couple of dozen old navy pistols, of a disused pattern, bought cheap from a marine store-dealer of doubtful honesty down at the harbour. Isaac's eyes gleamed brightly as soon as he saw the gleefully array of real firearms. 'He, he!' he cried joyously, fingering the triggers with a loving touch, 'dat de ting to bring down de pride ob de proud huckra. Ha, ha! Next Wednesday, next Wednesday! We waited long, Mistah Delgado, for de Lard's deliberance; but de time come now, de time come at last, sah, an' we gwine to hab de island ob Trinidad all to ourselves.'

The old African bowed majestically. 'Slay ebbery male among dem,' he answered aloud in his deepest accents, with a not wholly unimpressive mouthing of his hollow vowels—'slay ebbery male, an' take de women captive, an' de maidens, an' de little ones; an' divide among you de spoil ob all deir cattle, an' all deir flocks, an' all deir goods, an' deir cities wherein dey dwell, an' all deir vineyards, an' deir goodly castles.'

Isaac Pourtales' eyes gleamed hideously as he listened in delight to that awful quotation.

THE DUBLIN BANK GUARD.

AFTER reading an article in *Chambers's Journal* for August 1885, headed 'The Bank Picket,' it struck me (says a correspondent) that a reminiscence of the Bank Guard in Dublin may not prove uninteresting. I say reminiscence, for, though the Bank Guard I mounted there now pretty much, I believe, as in the days of which I write—some eight-and-thirty years ago—the incident which my memory recalls in connection with it is a reminiscence of an event, the

actors in which, except myself, have passed away or have left the service; and in either case, I have not seen or heard of any of them for many years; but if one or two still survive, and this should meet their eye, I have no doubt the remembrance recalled by it will raise a hearty laugh at what was to them certainly no joke, and to me personally was a lesson never again to disobey orders.

The guard over the Bank of Ireland in Dublin was then—as I believe it is now—under the command of the senior subaltern for guard in the garrison, with a proper complement of non-commissioned officers and men; and was relieved, like all the other garrison guards, every twenty-four hours. The men's guardroom was a large apartment, flagged with stone, on the ground-floor of part of what was once the old Irish House of Parliament; and above it was the officer's guardroom, which was reached by a flight of stairs, at the bottom of which a door communicated on the left with the men's guardroom, and facing the stair-foot was a small heavy door leading into the street. In this door was a barred aperture about a foot square, closed by a sliding piece of wood, which could be drawn aside to permit the examination from within of any one outside; and inside the door, a sentry was posted during the night. Through the barred aperture, the 'Grand rounds'—as the field-officer on duty for the day was called—whispered the countersign to the officer of the guard when he visited the bank at night, after which he was admitted, to enable him to inspect the guard. To the left of the door outside was also a large iron-studded gate, leading into a small courtyard, where the guard paraded during the daytime; but this, as well as the small door, was locked and secured by heavy bars at sunset, and the keys of both were kept by the officer of the guard.

Immediately after the mounting of the new guard, every morning a knock at the door of the officer's room announced the arrival of the head-porter with a large book, in which the officer signed his name, rank, and regiment; and on the departure of the head-porter with the book, a half-sovereign was found on the table where the book had been. There were no meals provided for the officer, as for his more fortunate comrade mounting the Bank Picket in London; nor were the non-commissioned officers or men 'tipped,' as at the Bank of England; but they, as well as the officer, were left to shift for themselves in the way of food during the twenty-four hours, without even the assistance of a canteen vendor, so that the dinners and other meals had to be sent from the barracks—in the case of some regiments, a distance of two or three miles—there was no blanket or greatcoat either provided at the Bank of Ireland for the men; but the officer had some articles furnished for his use, for a consideration, which were exhumed towards night from a small closet in the officer's guardroom. There was no library or anything of that kind for men or officer; and they were left entirely to their own devices how to fill up the tedium of the twenty-four hours' duty.

The furniture of both guardrooms was scanty, that in the men's room consisting of a few

forms and a guard-bed of wood, raised a couple of feet from the ground; while the officer's furniture was more luxurious, he having an old leather-covered couch, with four or five chairs to match, and a large table. There was, however, abundance of fuel; and candles of the mutton-fat order were liberally supplied at the rate of one to each room. Both apartments were large and lofty, the ceiling of the officer's being vaulted; and its walls, in my time, were covered with drawings in pencil and coloured chalks, more or less well done; and many very amusing, being caricatures of well-known staff and other officers, or sketches of various funny incidents which had taken place at guard-mountings and field-days, in which the figure of old Toby White, the well-known town major, was always prominent, as well as an adjutant of one of the regiments, famed for the peculiar peak which adorned his shako, and his feats of horsemanship, which seemed meant to illustrate the many ways one could fall off a horse without getting hurt. Over the vast mantel-piece were drawings of the breastplates of every regiment that had mounted the guard, all artistically and faithfully done. Like the gorgets, these breastplates have ceased for many years to be part of the uniform of the British infantry; but for the benefit of those who don't remember them, I may say that they served to clasp across the breast the broad white sword-belt worn in full uniform in the days of coats and epaulettes, and were very handsome, having, besides, the number of the regiment, the regimental badge, and the various battles authorised to be borne on the regimental colour, emblazoned on them.

Amongst the other drawings on the walls was, directly opposite the door leading from the stairs into the guardroom, the figure of a young lady clad in the full-dress uniform of a regiment dating many years anterior to the time of which I speak. She was represented as standing at the salute, with a drawn sword extended in her right hand, and the left at the shako peak shading the eyes. There was a legend—whence derived or how handed down, I am unable to say—that the young lady in the obsolete uniform was the wife of an officer of the guard who one night, many years ago, had become intoxicated on duty; and that she saved his commission by dressing herself in his uniform and turning out the guard to the field-officer when going his nightly rounds. This legend was, I have no doubt, as true as very many which are now implicitly believed; but be that as it may, it was an article of faith amongst the subalterns of the Dublin garrison, who always regarded the fair young figure in the quaint uniform with a certain amount of respect.

In those days, the guardrooms in Dublin were pretty generally ornamented with sketches, some of which were very well done. I may specify 'The Kildare Hunt,' round the wall of the upper castle guard; and a monument upon a wall facing the door in the lower castle guard, on which was the following inscription:

IN MEMORY OF

A Wiggie received by a Subaltern of this Guard
from ———.

May whose end be as his life has been—peaceful!

That the above stung the officer in question, who was a well-known martinet, but, unfortunately, had seen no war-service, we soon had reason to know; for an order was issued that in future all commandants of guards were to certify in their guard Reports that the walls of their guard-rooms had not been defaced during their tour of duty.

One snowy, bitterly cold day in the winter of 1847-48, I found myself the occupant of the Bank Guard in Dublin, and in the proud position of commandant. The semi-darkness of the afternoon was fast verging on night, and I nodded, half asleep, over the huge fire which blazed on the hearth, when the door opened, and admitted, with a cold swirl of frosty air, the handsome, jolly face of a brother sub, and particular friend of mine, named Harry P—. The old room looked instantly bright and cheerful, and he sat until well after dark, smoking and chatting pleasantly. At length he rose to go, and told me that he was going to dine with his brother at Richmond Barracks; and that after mess, he, his brother, and another officer of his brother's regiment, were about to visit the theatre, where some popular performer was starring it. 'And I tell you what it is, old fellow,' he added, 'we'll all come here afterwards; and you have some oysters in, and give us a supper.'

It was in vain that I reminded him of the order that no one was to be admitted to the Bank Guard after tattoo except on duty. He laughed at my scruples; and at last, on his hinting that want of hospitality was at the bottom of my strict observance of standing orders, I was weak enough to give in; and the tempter descending the stairs, stopped to say, by way of encouragement: 'You know we shan't be with you before twelve o'clock; and by that time, the Grand rounds will have turned you out, and will be snug in bed in the upper castle.' So saying, without giving me time to recall my inconsiderate promise, he was off, and I had nothing left me but to call my servant; and between us, we managed to arrange, if not an elegant, at least a comfortable little supper, which was brought in from a neighbouring hotel. Fresh lights were placed upon the now well-furnished table, more coals added to the already roaring fire, beside which simmered a kettle of boiling water, ready to mix with what in the Irish capital is known as 'the materials;' and towards the 'smal' hours ayont the twal, I sat waiting the arrival of my expected guests, as well as the field-officer of the day, who, to my great discomfort and uneasiness, had not up to this hour put in an appearance.

I hadn't long to wait after midnight had struck for Harry P— and his companions, who didn't sympathise with me much concerning the non-arrival of the field-officer, Harry only remarking: 'Oh, he'll only just look at the guard, and be off to roost with as little delay as he can. The snow is falling fast, and no one with any brains will stay out in it longer than he can help.'

So, laying this flattering unction to our souls, we proceeded, without further ceremony, to pay attention to the good things provided for the comfort of the body, and had already got through a fair lot of the bivalves, when suddenly the loud challenge of the sentry at the door below

rang through the vaulted corridor: 'Who comes there?' The reply from outside was: 'Rounds;' then: 'What rounds?' Answer: 'Grand rounds,' followed by the sentry's: 'Stand, Grand rounds; Guard, turn out.'

This called me to take my part in the ceremony; and my visitors, still looking on the affair as a prime joke, proceeded to ensconce themselves in the closet containing the officer's bedding, which, on account of the expected advent of company, had not as yet been disinterred. As he closed the door, I heard Harry P— remark, by way of apology to the others: 'You know, his Satanic Majesty may prompt him to come upstairs, and so we had better not show till he goes.'

I now dashed down below, and after the accustomed interchange of question and answer at the barred window in the door, ordered his admission, and proceeded to the guard, which was turned out in the men's guardroom, to duly 'present arms' to the Grand rounds. (I may here remark, that to the sentry's shout of 'Guard, turn out' in the Bank Guard, the response was decidedly Irish, for the guard didn't turn out at all, in the literal sense of the word, at night, but 'fell in' on the stone flags of their guard-room.)

The field-officer on this occasion was a Major F—, of a Highland regiment, a jolly, pleasant-looking little man, who evidently enjoyed to the full the good things of this life; and after acknowledging the salute and receiving the report of 'All correct, sir,' he desired me to dismiss the guard, and as we left the room, said: 'I was looking at the bright light in your guardroom window as I came up, and envied you the roaring fire you must have inside, and I darsay a good glass of something hot also. If you don't mind, I'll come up and thaw a bit, for it's snowing hard, and most bitterly cold outside.'

What could I say, but—heaven forgive me—express the pleasure it would give me to do the hospitable; and so, with troubled heart, I bounded up the stairs ostensibly to fetch a candle to light the major up, but really to clear the room of the prisoners, had they left the closet, or, at all events, to warn them of approaching danger if they had not. In either case, I was, however, foiled, as the Grand rounds, though a portly-looking little man, and not active to all appearance, still had the use of his legs, well tried, no doubt, on many a good Highland moor and mountain; and in spite of my knowledge of the staircase, he was in the guardroom close at my heels. It was, however, to all appearance entirely without any occupants save ourselves, and only the remains of the supper looked suspicious. This at once attracted the major; and to his remark that I appeared to have had a party here, I replied loudly, in order to give notice to the prisoners, that some of our fellows had dropped in during the afternoon and had some lunch; that I had had my dinner after they had left, and that my servant had not yet removed the débris; that I dared say there were some oysters still left, and would the major let me get him a few, &c.? which caused the little man's eyes to twinkle as he tasted himself by the ample fire; and unbuckling his sword, he seated himself in a chair at the table, and fell to without more ceremony, remarking: 'You are

very kind. What Sybarites you — th fellows are! I'll just take an oyster or two, and qualify with a glass of hot toddy, to keep out the cold of this bitter night.'

After doing ample justice to the supper, he proceeded to undo a couple of the bottom buttons of his doublet, and, with a sigh of satisfaction, drew his chair closer to the fire, and lighting a cigar, settled himself comfortably for a chat. I, too, lighted a pipe, and with an affectation of enjoyment I was far from feeling, I sat opposite to him, and listened to what I have no doubt were very amusing anecdotes, but which fell unheeded upon ears strained to catch a sneeze or cough or other ill-timed sound from the closet. All, however, was quite still there; and after what seemed to me a century of anxious suspense, the Grand rounds finished his glass, and with profuse thanks for my hospitality, rebuckled himself into his sword-belt and took his departure.

It couldn't have been much more than an hour since he came up-stairs, and yet to me it seemed ages until the outer door again closed on him and I heard his muffled footsteps retreating over the soft snow. But if the time appeared long to me, what must it not have been to the prisoners caged in the stuffy closet! I found them peeping inquiringly out from their prison; and when the 'Coast clear' was announced, such a peal of laughter resounded through the old walls as made them ring again; and there being no fear of further disturbance, we straightway drank health and safe home to the jolly old Grand rounds; and seating ourselves at the table with appetites sharpened by the perils we had passed, we did ample justice to the remainder of the supper, and proved that 'all's well that ends well' in a most satisfactory manner. Far into the night, or rather well into the morning, was it before we parted; and as Harry shook my hand at the stair-foot, he said: 'Good-night, good-night, or rather morning. We are all much obliged for the night's amusement; but between you and me, old man, I don't think that I, for one, will ever again join a supper party in the Bank Guard.' To which I replied: 'No; nor will you ever catch me again giving one.'

I have since often thought, did Major F—— suspect that the closet had tenants? If he did, he kept it to himself; and though we often met afterwards, he never made any allusion to that night. He may have meant to teach me a lesson, or he may not; but if he did, he did it most kindly, and it has never been forgotten; nor ever since have I disregarded the resolution. Always stick to orders, which I formed that winter's night upon the Bank Guard.

TREASURE TROVE.

A STORY IN FOUR CHAPTERS.—CHAP. II.

AROUND a roaring fire in a little, lone, beetle-browed inn which stood by the sea about six miles from Saint Quinians, known as the *Lobster*, were assembled one evening, about a week after the events recorded in the last chapter, some half-dozen men, whose apparel and appearance proclaimed them fisher-folk. They were sitting simply smoking and drinking, not speaking, for

it may be noted that men whose lives are spent in one continual struggle with danger and death are generally silent. It was a wild, wet evening, although it was April, and the great waves were tumbling on the rocky shore with a booming which never ceased, and which was audible above the roar of the wind and the rattle of the rain against the rickety casements, so that the assembly was not a little astonished to hear the voice of the landlord talking with a stranger, and presently to see a tall man, clad from head to foot in waterproofs, enter. All eyes were instantly fixed on him in a suspicious sort of manner, and more than one man rose, for in these days, coast-folk enjoyed almost as little peace on land as at sea, as preventive men were continually poking about in search of smugglers, and the presgang was hard at work collecting hands for His Majesty's ships. But as the newcomer was alone, and saluted them with a 'good-evening' as he divested himself of his reeking overalls, their momentary alarm seemed to subside, and they made a space for him in the circle round the fire.

The visitor, who was no other than Jasper Rodley, ordered a stiff tumbler of grog and a new pipe, took his seat, and gazed intently at the leaping flames for some moments without speaking. 'It's a wretched evening for a walk,' he said presently; a remark which elicited a gruff murmur of assent from the circle; 'and the road from Saint Quinians is as hard to follow as the course between Deadland Shoal and the Painter Brooy,' he continued. He was evidently a sailor, so that eyes were again fixed on him with something of the original suspicion.

There was another pause, during which pipes were puffed vigorously and more than one mug emptied.

Jasper Rodley broke the silence. 'Doesn't a Captain West live somewhere hereabouts?' he asked.

'Yes, sir,' replied a man. 'Can't mistake the house—a long white un, standing in a bit o' garden with a flagstaff in it, about two miles towards the town.'

'Strange sort of man, isn't he?' asked Rodley.

'Well, sir, he's strange in some things; but nobody don't know any harm of him,' replied the man; 'cos it's precious little folk see of him.'

'Said to be very rich, isn't he?' asked Rodley.

This question brought the eyes of the party to bear again upon the speaker, the problem troubling the rude minds being: 'If this chap wants to see the captain, and hails from Saint Quinians, why on earth does he go two miles farther than he need?' Mental conclusion arrived at—stranger up to no good.

'Well, no, mate,' replied the man to Rodley's question; 'he ain't what you'd call rich, not by no means, seem'n that he's only a half-pay captain. But he's been richer durin' this last four year than he wun afore.'

'Lives all alone with his daughter, doesn't he?' continued Rodley.

Mental conclusion previously arrived at by the party is confirmed.

'Yes,' replied the man who acted as spokesman; 'lives with Miss Bertha, the cap'n's do. She's a proper quean, she is. Purtiest slip of a lass in these parts by a long way. But the cap'n

he keeps her uncommon close; a-bear her to be out of his sight; and when she goes into town a-marketin' on Wednesdays, we says it's about all the life she sees.'

Another silence ensued, during which the half-dozen pairs of eyes were taking stock of Rodley sideways, and endeavouring to solve the problem of his intentions from his dress and appearance.

At length Rodley said: 'Wasn't there a lugger wrecked off here about four years ago called the *Fancy Lass*?'

'Nobody heard of it,' replied the spokesman. 'There was a lugger of that name left Saint Quinians about four years ago; but she warn't never heard of no more; and bein' a smuggler, that ain't surprisin'.'

'I thought some bodies were washed ashore by the Locket Rock about that time,' observed Rodley.

'There's a sight o' poor chaps washed ashore hereabouts every gale,' replied the man. 'Tain't possible allus to say who they be or where they come from. Saint Quinians' churchyard is full on 'em.'

Not another word was spoken for at least twenty minutes. At the expiration of that time, Rodley rose, went to the door, looked out, remarked that the rain had stopped, put on his overalls, paid his reckoning, wished the company 'good-night,' and went out into the darkness.

'Didn't get much information out of these chaps!' he muttered as he pulled his hat down over his face against the driving wind and retraced his steps towards the captain's house. What with battling against the wind and stumbling about the uneven road in the dark, it was an hour before the solitary light in the captain's house met Rodley's gaze. He crossed the small garden and knocked.

Bertha opened the door, and asked timidly: 'Who is it?'

'I—Jasper Rodley,' was the reply.

She uttered a cry of alarm, and would have shut the door, but that Rodley had placed his foot in the opening. The captain hearing his daughter's cry, came hobbling along the passage hastily. When he beheld Rodley, a cloud came over his face, and he said: 'Hillo, mate, what is it at this time o' night?'

'I want a bed for to-night, and a few words with you, captain,' said Rodley, who by this time was fairly inside the house, and coolly taking his hat and coat off.

'But I've no room here. There's an inn farther down, where they'll put you up better than we can.'

'I'm a sailor, captain,' replied Rodley, 'and I don't mind where I shake down: that's of no consequence, but the talk is.'

The captain, who seemed to treat his evidently unwelcome visitor with a kind of deference, shrugged his shoulders, and led the way into the sitting-room, where the remains of a substantial meal graced the table. Jasper Rodley made himself very comfortable in an armchair; the captain, who was the wreck of a fine man, and who, being lame from a recent accident, used a stick, remained standing, as if uncertain how to proceed next; whilst poor Bertha stood, trembling with fright, by the door.

'Captain,' said the visitor, 'isn't ten o'clock the usual time for young ladies to go to bed?'

At this hint, the old man made a signal to his daughter, who retired.

'Now then,' continued Rodley, 'let's to business.'

'I'm not aware that I have any business with you,' said the captain.

'Well, you'll soon have some with me. Look here. We're men of the world, and we must understand each other. I've only met you twice before: each time you were coming from the same place, and each time you were astonished, in fact, alarmed, at seeing me.'

'Well, sir, and what of that?' asked the old sailor. 'Here am I, an old East India Company's skipper, living in a lonely place, where I don't see half-a-dozen people in the course of a month. You came upon me suddenly, just when it was getting dark, and I was naturally startled.'

'O no; that's not it,' continued Rodley. 'But we'll leave that for a bit. First of all, I'm head over heels in love with your daughter.'

'I'm sorry for it.'

'And I intend to marry her,' continued his visitor.

'That depends firstly whether she will have you, which I very much doubt,' said the captain; 'and secondly upon whether I let her go, which I also doubt.'

'So you think,' sneered Rodley. 'Now, then, to the other matter. Four years ago, you were a poor man.'

'So I am now,' retorted the captain.

'O no; you're very well off; your private bank is safe enough.'

The captain fidgeted uneasily in his chair at this. 'You see, I know more than you think,' said Rodley; and bending over and speaking in a lower tone of voice, he added: 'Is it not a little curious that you should have come into your fortune about the same time that the *Fancy Lass* was wrecked about a hundred yards from your house?'

The poor old captain's amazement and perplexity culminated here in a start which sent his pipe flying from his hand. 'Why, how do you know? Who told you?' gasped the old man. 'Not a soul escaped from her.'

Jasper Rodley looked searchingly at him for a moment, and said: 'Perhaps not. That's got nothing to do with what we are talking about.'

'And the boat went to pieces,' added the captain.

'You're almost as well up in the subject as I am,' said Rodley. 'But she was wrecked on Sherringham Shoal, and went to pieces on the Locket Rock.'

'Well?' asked the captain.

'And her cargo—valuable cargo it was,' continued Rodley, actually smiling with enjoyment at the misery he was causing—'her cargo was recovered.'

The old man rose and hobbled about the room in a state of pitiable agony. 'How do you know?' he asked desperately.

'The last time I met you,' replied Rodley, 'you were so startled that you dropped something—this.' He put his hand into his pocket and drew out a sovereign.

'What do you infer from that?'

'Why, what's the use of asking me what I infer? What's the most natural inference I should draw?'

The captain resumed his seat, and was silent for some minutes. In the meanwhile, Rodley filled another pipe and mixed himself a glass of grog.

At length the old man said: 'I understand the case to be this. You want to marry my daughter. If I refuse, you'll'—

'I will expose you as having taken property which does not belong to you,' replied Rodley.

'You must prove it,' cried the captain. 'Why shouldn't I keep my money where I think fit? This is a lonely house, in a dangerous neighbourhood; the folk all about are desperate men—wreckers, smugglers, old privateersmen, escaped pressed-men—men who, if they thought I kept money and valuables on the premises, would not hesitate to rob me; and what could we, a lame old man and a young girl, do to protect ourselves?'

'I can prove it,' continued Rodley quietly. 'But I'm not such a fool as to tell you how I can prove it. Look here; we need not waste words over it. You are in my power; you cannot escape. The price I put upon keeping silence upon a matter which would bring you into the felon's dock, is the hand of your daughter Bertha. I give you a week to decide, for the matter presses, and I do not intend to remain longer than I can help at Saint Quinians.'

'Then you would take my Bertha far away from me!' exclaimed the old man in horror.

'Not necessarily; my business is on the sea. When I am away, she would remain with you. It would comfort you, and relieve me of the expense of keeping up an establishment, and would thus be an agreeable arrangement for both parties. Is that a bargain?'

The old man bowed his head.

'Mind,' said Rodley, smiling, as he rose to go to bed, 'I shall keep strict watch on the—on the bank!'

THE CORACLE.

HAVING seen this boat of ancient Britain on those Welsh rivers where it has been wont to float since the commencement of the historic period—having seen a Welsh fisherman ferry his wife over the Towy in a coracle, we will endeavour to describe this antique relic and to relate a few leading facts of its history. Before the subjugation of the British, this boat of theirs was probably found in all parts of England; it is now confined to Wales, the last stronghold of the British after the arrival of the Saxons—English, as they are now called. It is found, or, at least, only in a few parts of Wales; and in the course of this short narrative we shall not be far in other regions, though it may be rambling a little to mention that boats exactly similar interesting to the coracle of Wales are frequently used upon the rivers of that great country; and this forms one of those obscure links which Mr Borrow loved to dilate upon in his *Wild Wales*, a book of wonderful interest to the learned and to travellers.

all the links together into a connected chain, and taking language into account, the evidence is strong that the Welsh, or ancient British, were originally emigrants from India.

The antiquity of this queer little ark—for it is more ark than boat in shape—is undoubted. Herodotus describes the common boats of the Euphrates as having been in all respects similar in pattern and construction to the coracles of Wales. The materials for making these simple, home-built vessels were naturally such as the particular country might afford. In India they were made of wicker, covered with skins; and on the Euphrates they were of willow, covered with hides. In the salmon-fishing season, almost any day except Sunday from April till the end of August, coracles may still be observed on the rivers Towy and Teivy, having remained there unaltered from the time when the attention of Caesar was attracted by them during his campaign in Britain. A fisherman still slings his boat over his back, and carries it home in that position; and on reaching his dwelling, he sets it erect against the house-wall, and leaves it there till he again goes fishing, when he carries it back to the water. An old Welsh adage runs, 'A man's load is his coracle;' and in former times, when this old-fashioned boat was covered with raw hides, the load must have been a heavy one. The hides, however, have now been discarded for a light covering made of waterproof canvas. The shape of the coracle remains unaltered. It is the broadest of boats in proportion to its length, hence it moves through the water under the alternate stroke of the paddle with a motion like the waddling of a duck.

The time arrived, as it usually does to men of genius, when Caesar turned the idea of the coracle to good account. Ptolemy had destroyed his bridges, and the only boats that could have saved him were such as he could build quickly of any common materials which might come to hand. He remembered the coracle, which he had seen in Britain built of hazel, or willow, or any kind of rods that were capable of being woven so as to form a framework for the covering of skins. Caesar immediately proceeded to construct his boats; and by means of a number of coracles of large size, but rapidly constructed, his army successfully crossed the river, which had stopped and endangered its march.

A Welsh coracle for one passenger upsets so easily that a stroke from a salmon's tail is said to be more than the cranky little boat can bear without being overturned. One person forms a full freight for a coracle of the usual size, besides the one who uses the paddle; and that person being the oarsman's wife, he places her cautiously in the stern, and declines a second passenger.

When there are two persons to be ferried over, one of them is usually taken across first, and the other is left on the bank, and brought over afterwards. During the voyage, certain precautions must be observed, which are well understood by all persons accustomed to this kind of navigation. But we remember on one occasion, when an English lady, a tourist, was in the act of crossing the river below Cardigan, some of her friends having already crossed, while others watched behind—for her precautions before setting out had been elaborate. She had no sooner reached

the middle of the stream than she rose suddenly to her feet, and the next moment was capsized and sprawling in the water. It is a 'rule of the road' never to stand up in a coracle.

This ancient boat possesses mythological as well as historical interest, since it was first used symbolically in some of the curious mystical rites of the Druids. Among the traditions of Bardisyn was that of the bursting of the 'lake of waters,' when all mankind were drowned except a single pair, who escaped to Wales in a naked vessel—that is, a ship without sails. According to the Triads, this ark of Wales contained a male and female of all living creatures including the parents of the Cynry, or Welsh people. This human couple were in due time deified, the Noah of the Cynry sharing this honour with his wife. His symbol was an ox; hers, a cow. A Bardish and very singular rite of sacrifice to one of these deities took place, curiously enough, at the very spot where the largest number of coracles is now stationed, a boat of this kind being used in the ceremony. At the month of the Teivy, in Cardigan Bay, where the coracles are now used in trawling and setting nets for the salmon-fishing, three miles below Cardigan, at the little fishing village of St Dogmels, the sacrifice was celebrated. At the appointed time, the Druids, clad in their emblematic white robes, and the Bards in robes of sky-blue, assembled at the spot, when the victim was placed in the coracle and the frail boat was turned adrift.

The coracle figured also on the important occasion of the probation of a Bard, when it was used by the neophyte, or probationer, in his passage to and from the island of Sarn Badrig, off the coast of Carmarvonshire. In rough weather this would be an impossible feat. Probably the Gwyddnaw (priest of the ship) selected a suitable day for this occasion. Having brought the novice to the shore, the usual confession was pronounced by him in these words: 'Though I love the sea-beach, I dread the open sea; a billow may come undulating over a stone!' The priest then spoke as follows, to reassure the novice: 'To the brave, to the magnanimous, to the amiable, to the generous, who boldly embarks, the landing-place of the Bards will prove the harbour of life.'

We will only add to this brief account of the coracle, or river-boat of ancient Britain, that the name is derived from *coryc*, a ship.

HOSTESS AND GUEST.

PART II.—THE DUTIES OF A GUEST.

HAVING previously considered the question of the duties of a hostess, I now come to speak of those of a guest; and the subject being less exhaustive than the former one, can be treated with considerably more conciseness.

Firstly, then, when invited to stay at a friend's house, use your judgment with regard to the advisability of accepting the invitation. If it is proffered spontaneously and without any apparent object in view, avail yourself of it, if inclination prompts you; but if you have reason to think that you are only asked because the hostess thinks it 'necessary,' or deems it likely that you

will 'expect it,' hasten to write an apology at once. Never, however, do this, nor the reverse of it, nor anything else, for the matter of that, on impulse—take time to consider: it won't occupy you long, and the result will repay you. On no account reply to invitations on postcards: such missives, although highly estimable and convenient in their proper place, should only be made use of for the conveyal of unimportant messages. A lady who favours you with an invitation to her house, may at least be considered worthy of such trifles as a sheet of note-paper and a penny stamp.

When you have made up your mind to avail yourself of an invitation, be sure to do so at the time specified by your hostess. Never select your own time, except when especially requested; should you be guilty of such a breach of etiquette, you would, in all probability, seriously incommode your entertainer. It is the custom in many families—especially those who live in the country—to invite a succession of visitors, one after another; and if an invited guest declines going at the time for which he is asked, he ought to remain absent altogether; for, to say, 'I cannot go to you next week, but shall be happy to do so the week following,' may considerably embarrass the head of the house to which he has been bidden.

Supposing, then, that you have accepted an invitation to a friend's abode, be very careful not to miss the train, or other mode of conveyance by which you have appointed to travel, lest your host's carriage—and perhaps some member of his family also—be kept, through your carelessness, waiting to receive you at your destination. Do not, on arriving at the house, make an unseasonable fuss—as some persons do—about the disposal of your luggage; leave the carrying in and arranging of it entirely to the servants; and should anything go wrong, rectify it afterwards. Ascertain as early as possible the hours for meals, and be ready to the moment for such. Also, if it be customary in the household to have family prayer, be prepared always to attend it with punctuality, as nothing is more disturbing than to have droppers-in entering the room when the service is half concluded. Do not come down in the mornings before the shutters are opened or the rooms made up; servants feel much aggrieved by this practice, nor is it fair towards them. If you are, from habit, an early riser, remain in your chamber, where you can read or write without being in anybody's way; or, if the weather be fine, go out for a walk, quietly, without any slamming of doors or obtrusive noise or bustle. Always remember, when entering the house after walking, to clean your boots well upon the door-scraper and mat. Do not on any account neglect this most important admonition; even though there may not be any perceptible mud upon the soles of your footgear, a certain amount of dust will be sure to cling, and will by no means improve your host's carpets—or the tempers of his servants.

Do not eat immoderately at table, or in a

manner to occasion remark. If you are afflicted with an abnormal appetite, satisfy its first cravings in the privacy of your apartment with biscuits, sandwiches, or something else of your own providing. It is dreadful to eat and drink as though one had not for days enjoyed a meal. On the other hand, do not, from a feeling of false delicacy, abstain from eating enough. A healthy, hearty appetite is to be commended; nor is anything more distressing to a hospitable hostess than to see her viands unappreciated, while her guests leave table apparently unsatisfied with what has been provided. It is needless to add that temperance in drinking is all-important.

Be especially careful to avoid little *gaucheries*, of which even some well-bred persons are occasionally guilty. Those who are accustomed to live alone are particularly apt to fall into odd ways, because they have not, as a rule, anybody to please or consult except themselves. I have seen a man of title and position, who, through living an isolated life, had many strange oddities: ignoring the use of the butter-knife and using his own—touching the lips of the cruet-bottle with his finger—turning over the contents of the biscuit-box—helping himself to sugar without the aid of the spoon or tongs. Persons with whom he sat in company called him 'vulgar,' whereas he was in reality *outré* and odd. A learned man, caring nothing for conventionalities, and living wholly alone, he fell into strange habits, and they clung to him, which is abundant proof that we ought, each and all of us, to guard against such.

Carefully steer clear of topics of discourse that you think might by any possibility be distasteful to anybody present; and if your host and hostess, or other members of the household, should chance to disagree in your presence upon any point, whether of great or little importance, do not take any part in the discussion, or side with either combatant. Maintain complete silence—or, if you can adroitly change the subject, or turn the conversation into another channel, so much the better; but this sort of thing requires so large an amount of tact and address, that if not done nicely, it had better be left alone.

Endeavour at all times to be obliging in the household. Offer your services upon all necessary occasions, but do not force them or appear officious; it is bad taste, and is certain to worry your hostess. If an entertainment is to take place in the house, keep out of the way as much as possible during the preparations for it, unless you can be of some substantial use; and while the festivity is in progress, do all you can to oblige the entertainer and contribute to the enjoyment of the guests. If you can sing, dance, or recite, do all (if asked) without making a fuss about it. At the same time do not fall into the opposite extreme of giving the company too substantial proof of your prowess in the vocal or histrionic art. Some persons are a perfect nuisance in this respect; once they sit down to the piano, they cannot be induced to leave it, and keep on singing song after song, to the exclusion of others and the weariness of the assembled guests. Assist your hostess in effecting introductions, and, if necessary, in ascertaining that each person has visited the supper-

room and that nobody has been overlooked. In short—feeling yourself for the time a member of the household—perform all such duties as would, were you in reality so, fall to your share.

Never give unnecessary trouble to servants. Avoid, as far as possible, slopping water over your washstand, drenching the floor when you take your bath, emptying the entire contents of the water-jug into the basin every time you wash your hands throughout the day; throwing your soiled linen carelessly about the room; leaving your wearing apparel scattered promiscuously over the bed and the backs of the chairs; calling for hot water when cold would serve you quite as well, or better; soiling three or four pairs of boots and shoes in the day; leaving damp umbrellas upon the hall-table instead of in the stand; and going in and out of the house an unlimited number of times for idle pastime, when once or twice would serve your purpose quite as well.

Be careful never to outstay your welcome. You can form a very good idea, from the nature and wording of your invitation, how long you are meant to remain, even though the time may not have been exactly specified; but if there is any doubt about the matter, do not take advantage of it by staying too long, or extend your visit to any unusual length unless decidedly pressed to do so. It is far better to go away leaving a wish for your return, than that there should be the very smallest feeling of an opposite nature in the minds of your entertainers.

Be particularly cautious during your visit never to allow yourself to appear in the way. Should your host or hostess be called upon to receive a long absent or favoured friend, or one who is a rare visitor, retire quietly for a while, as there may be things to talk about that your presence would forbid, or at all events hamper; but be sure that you withdraw gracefully and without fuss, having a fair pretext on your lips, if asked your reason for doing so, as—although a well-bred hostess will never under any circumstances allow it to appear that any member of her household is *de trop*—a ladylike or gentlemanlike guest will never permit the possibility of her feeling that such is in reality the case.

When Sunday comes round, attend worship with your entertainers, who will probably be pleased by your doing so, rather than that you should go wandering off to some distant church alone; and endeavour throughout the day to adapt your ways and doings to those of your host and hostess. If you do not like or approve their mode of passing the Sabbath-day, you can take your leave before the next comes round; but it is the worst possible taste for a visitor to isolate himself in his own apartment, because the household of which he is *pro tem* a member sees no harm in certain things which stricter persons may; while, on the other hand, it is equally objectionable to appear to ignore the Sabbath, where those about you have been educated in a more rigid school.

Finally, be kind and courteous to all, but never servile, nor yet haughty, for the one is quite as bad as the other, and both are hateful in the extreme. If, when you are departing, your host,

or hostess, invites you to come again, you may feel justly satisfied that you have succeeded in making that most enviable thing—a good impression.

WHAT CAREER FOR TOM?

Ay, what was to be done with him? He had just completed his fifteenth year, was famous at cricket and football, rode his bicycle up and down the steepest gradients, was a fearless swimmer, and indeed the athletic paragon of his schoolmates. But he began to tire of his lessons, and to utter dark confidences to his sisters that 'Latin would be no use to a fellow when he grew up;' that 'he felt like a loafer as he went along the lances to the grammar-school;' that 'Sam Jackson and Harry Wilde were going to business at Easter; and that if papa did not find him something to do, he should perhaps run away to sea.'

This last confidence, which was given on a windy night, when the rain plashed most dismally against the windows of the children's room, quite alarmed Tom's sisters, who were romantic and tender-hearted girls of seventeen and eighteen. They began to cry, and to beg the indignant lad not to do anything so dreadful. But the more they petitioned, the more stubborn Tom grew. Tears and entreaties only hardened him into firmer determination to doff his mortar-board cap for ever. How could he stay at school, when his chums, Sam Jackson and Harry Wilde, had gone to business! What did girls know of a fellow's vexation at being left with a lot of young boys, not one of whom could hold a bat or keep a goal! To sea he would go, unless papa got him some sort of a berth by Easter.

The poor girls were crying very bitterly, and the rain throbbed in sympathy against the panes, and Tom stamped up and down the floor, when his mamma came in. She was much surprised at the scene; for the children were always on the best of terms. She was still more surprised, and a little dismayed, when she learned the cause of the scene. Being a prudent and self-restraining woman, however, she did not say much; and with a few general remarks, 'that of course all boys must go to business in due time,' she terminated the painful discussion.

After supper, when her husband and self were alone, she startled the good easy man by relating what had taken place. Tom's father was the principal doctor of the neighbourhood, which was so salubrious and so poor that he must have left it long before, had he not possessed a little independence, which kept the household afloat. He was of an indolent turn, getting gray and fat, like his old cob. Want of work, magnificent health, and a managing wife, who took all the worries of life off his shoulders, made him oblivious of the young world growing round his hearth. He could not imagine that his boy and girls were weaving anticipatory tissues of their lives, that these young birds were getting fledged for flights far away from the home-nest. So, the announcement of Tom's rebellion against school, and his thoughts of evasion, came on the doctor as the greatest event he had known for years.

'Now you mention it, Maria,' said he, when

he began to quieten down a bit—'now you mention it, Tom is really growing a big fellow. He'll be six feet high, if he's an inch, by his twentieth year. And what a square stiff back he's got! He takes after my mother's family; they were all strapping fellows. Yes, Tom's too big for school. He's like a salmon among minnows, among the grammar-school boys. Dear, dear, how lads do grow!'

'Yes, yes,' broke in Tom's mother, a little tartly—she had a temper of her own, as all managing women have—'Tom is big, and will be bigger; that goes without the saying. But what is to be done for the poor boy? What career do you propose for him?'

'Upon my life, I haven't the ghost of an idea, Maria. Now you have brought this matter on the carpet, it recalls a good deal I have heard of late. When I was at Bimpson's the other day, attending his wife of her seventh boy, Bimpson said to me, over a glass of wine: "Doctor, he is a fine child, I admit; but how he'll get bread and cheese, if he lives, I can't guess at all." And the poor fellow broke out into quite a jeremiad over the redundancy of boys just now. He has three lads waiting for careers, and the deuce-an opening can he find! Then there is Clumpit the wheelwright—you know Clumpit, Maria? Well, I've been attending him for hypochondria. He can find nothing suitable for his eldest son; and it preys on his mind, because the mother won't let him go away from home to try his luck in some of the big towns. And old Burrows met me the other day, and quite pitifully asked me if I could advise him what to do with his grandson. I was really sorry for the poor old man. Of course, I could not help him.'

Tom's mother looked more anxious as the doctor went on ramblingly; and at last she said: 'All this leads to nothing. Tom must have a career arranged for him by us, or he will take the matter in his own hands. I can read his mind; I know him better than you, my dear. What must we do with him?'

'I tell you, again, Maria, I have not a ghost of an idea. Yet, I do know one thing—he shall not be a medical man!'

Here the doctor relighted his cigar and smoked in frowning thoughtfulness, until Tom's mother said decisively: 'Well, if you do not know what is to be done with the dear child, we must ask the opinion of our friends. I, for my part, cannot allow this subject to drop. It must be taken up and carried out to the needful end. I know too well your easy-going way. Tomorrow, you will forget all about poor Tom. I say, and with emphasis, we must find a career for our boy. As you have no ideas, I shall write to such of our friends as have experience of the world; and ask them either to advise us, by coming over here to a sort of family council, or else to tell us by letter. Your connections and mine have among them a great deal of experience: they know what prospects there are for the rising generation better than we can know, in this out-of-the-way place. So, I tell you, my dear, my mind's made up; and tomorrow I will write the letters.'

'You are a genius, Maria, as I've often told you. I believe you would get us out of any

hobble, however formidable. I haven't the ghost of an idea; and you have the ideas themselves, heaps of them. Write, my dear, to all our relations that are likely to be of help to us; and we shall soon find a billet for Tom. God bless him! he is a good and clever boy, and deserves a splendid career. Don't forget my brother John; as a London lawyer, he will be a host of advice in himself. And be sure to ask your cousin Richard, the parson; he has always been fond of Tom; and besides, he's the shrewdest fellow I know, notwithstanding his cloth. He ought to have been a barrister. But, as that cannot be, he ought to be a bishop. How he would rule a diocese, Maria!

In the course of a few weeks, the family council assembled, for the doctor was really much beloved by all his connections; and his wife had so conched her request for advice that it was quite irresistible. On a keen March day, uncles, consins, and friends met; and after dining at the doctor's hospitable table, they began to consider what career would be most likely to assure Tom of a happy and prosperous future. The reverend cousin presided, at the general request; and he opened the subject as follows:

'When I got the letter which has brought me here to-day, I felt its appeal so strongly, that I made immediate arrangements to be present. Tom has always been an exemplary boy in conduct, though I must say his progress in the classics is deplorably slow. When I was his age, I read Homer for the pleasure it gave me; and I had Horace by heart. Now, a scholar Tom never will be; of that I have satisfied myself before dinner in a private talk with him. Well, the ground is so far cleared. Tom cannot be a scholar, *ergo*, he cannot be a clergyman; for of all things inappropriate, in my opinion, the extreme is an ignorant divine. In my profession, one ought to be steeped in Greek, permeated with Latin, and saturated with Hebrew. But even if Tom were a born student and of a serious order of mind, I could not advise his parents to devote him to the Church.'

Something like a blank fell on Tom's mother at the emphatic closure of the reverend cousin's speech. She had hoped that Tom might have gone to Oxford, as other grammar-school boys had done, and thence to some pretty rectory as a rural parson. While she sat in silent depression, the rest of the company talked in little knots, until the reverend president stopped them by saying: 'Now, Uncle John, I call upon you. No one is better able to say if the law promises fame and fortune for the rising generation, as it has done for the past generations since Cicero's time. Shall we make Tom an attorney or a barrister?'

'I am flattered by the manner you esteem my humble abilities,' answered Uncle John. 'It is a strange coincidence of thought. I have also come down from town expressly to deprecate the putting of our young hopeful to my profession. I believed I could lay my reasons before my brother and his good wife better by a few spoken words, than by any extent of correspondence; so I took an early train. Tom must not be a lawyer. Why, I proceed as briefly as I can to explain. First, the profession is more crowded than the market-place. Second, the crowd is

daily increasing, because almost every family of the middle classes that has thriven during the past twenty or thirty years is sending a boy into a solicitor's office. The business is supposed to be very lucrative, and it is esteemed highly respectable, which allures the *parvenu* mind. As to the fiction of the law being a lucrative pursuit, I cannot understand how it originated, still less how it is maintained. A few solicitors, with quite exceptional luck and good connections, may attain to opulence. But the rank and file of the profession merely earn a decent livelihood. If you want to know what fortune does for lawyers in England, read the reports of wills and bequests in the newspapers. While these are telling us of manufacturing, banking, and trading millionaires dying in all parts of the country, they rarely record the demise of a lawyer worth twenty thousand pounds. No, no; the law is not a money-making trade. But it will be still less so, and that is why I warn Tom's parents against it.

'Let me elaborate a little. Since I was put on the rolls, Law Reform, as it is pleasantly called by certain politicians, has been hacking away at our fees continually, until now, certain branches of the profession are no longer remunerative at all. County courts, for instance, have deprived me of hundreds a year. The Judicature Act has damaged my practice still more seriously. However, I am not here to dwell upon my own misfortunes, but to prevent my nephew Tom from having worse, by following in my footsteps. Past law reforms are trifles to what are coming! In a few years, the most respectable and valuable department of my profession will be simply worthless. I refer to conveyancing. Even now, it is sadly shorn of its former profitableness. Soon it will be *non est*. Registration of titles is bound to come; with it goes the old system of mortgage deeds and all the costly methods of land transfer. As in America and the colonies, the transfer of real estate will be merely the business of government officials, and the vendor and purchaser; lawyers will be eliminated from such transactions altogether. Then, as regards commercial cases—Chambers of Commerce will go on with their simple methods of arbitration and conciliation, until at last the courts will hear no more of traders' contentions than if such did not exist.

'Last and worst of all, there is growing a steady abhorrence of legal conflicts in all ranks and classes. When I was apprenticed, even the poorest fellow would rush into law against a neighbour or relative with the greatest confidence; ay, and be ruined with a sort of grim satisfaction. In those days, everybody delighted in law. Now, if I am not vastly wide of the mark, men will submit to the rankest frauds and personal assaults as meekly as the most abject Asiatics. Yes, really, the English race, once litigious to a degree, is positively afraid of entering upon the most trumpety suit in the inferior courts. Finally, the lowest of our business, that of the criminal courts, is dwindling into insignificance. Judges are holiday-making in maiden azeises all over the country; police stipendiaries are becoming sinecurists; and as soon as the tectotalers have made another million

or two of converts, the income of legal men from criminals will be nil. What with popular education, milder manners, law reforms, land reforms, and the rest, no man would think of putting a youngster into the fast decaying legal profession.

Uncle John spoke with such evident and crushing sincerity that Tom's father and mother uttered a simultaneous groan as he finished; and for a few minutes something like consternation kept all silent.

But the reverend president did not forget his duty, and afterwards resumed in these terms: 'My dear friends, I am sure we are all greatly indebted to Uncle John for his luminous remarks upon the actual and coming condition of the profession, of which he is so distinguished a member. Of course, our dear Tom cannot be a lawyer. Let us therefore proceed with our deliberations into another professional avenue; after the Law, Medicine comes, according to established usage. Tell us, therefore, my dear doctor, why you do not think of devoting Tom to your own pursuit. Of that, you must have far clearer and more accurate knowledge than any other person here present. Knowing how hopeless the Church and the Law are, do you not think it best to train Tom to succeed to your own practice?'

'I certainly am greatly surprised at what I have just heard of the degenerate state of two noble professions,' said Tom's father; 'indeed, I may express myself as stunned by the revelations. Yet, I do not think that the future of the Church and the Law is so discouraging as that of Medicine. If I saw the ghost of a prospect for my boy as a doctor, I would not have put you to the trouble you have so kindly taken to come here and advise me. It is my solemn conviction that in a few years general practitioners in medicine—and that means ninety-nine out of every hundred doctors in this country—will not gain salt. A few men of supreme ability in medicine will have that department of the profession to themselves; a few more will have the surgical. For the good old family doctor, there will be no place in the new house that John Bull is going to build.—You smile, dear friends, at my simile; but the prospect is not amusing to me. Uncle John tells us that his profession is crowded, and that "the cry is still they come." Yes, but they are men that come to the Law; whereas, women are swarming into our profession. Think of that, good folks! Realise what it means for the men-doctors of the next generation. All our practice among children and women will go to the doctoresses, as a matter of course. Women are naturally fitted for attending upon their own sex, and are, if truly feminine, *horn medicos*. Now that they have proved themselves equal to all the tests of the continental dissecting-rooms and to brazen out the lectures, and now that they are taking such brilliant degrees, I, for one, throw up the game, and say, *place aux dames!*

'Just think! there are nearly a million more women than men in these happy islands, and they are all bound to live. And accentuate the thought by my assurance that there is no one so ambitious and remorseless in professional competition as a clever woman! While our male

medical students are dissipating, idling, fooling, as they have always done since Hippocrates' days, their lady rivals are preparing to puzzle a John Hunter, a Claude Bernard, a Bichat, or any savant living or dead. I prophesy that, before the end of this century, women will sit in most of the high places of the medical profession. They have keener wits than men; they are more moral, more industrious, and more sympathetic. But I leave this part of the subject for another and more discouraging still—people are beginning to be their own doctors! When I was a young man, few persons were bold enough to quack themselves. Now; there are millions swallowing homeopathic pills and tinctures, and diagnosing their own ailments themselves! Add to them the other millions who feed themselves on patent medicines, and, I tell you, the field of operation is alarmingly diminishing for doctors of either sex. Nor have I yet unfolded more than a fraction of my sorrowful tale. Other multitudes, who, by all that is fair in social life, instead of following the good old plan of sending for the doctor when they have eaten, drunk, and worked, or pleased too freely, now bolt away to some hydropathic palace, and positively turn a fit of sickness into a spell of luxury! Talk about the Sybarites of old! Go rather and look at our own, "packed," shampooed, handled, dandled, and fondled in the vast number of our hydropathic "Halls of Idleness" and sensuous convalescing sanatoria! Do not stay to deplore these lapses from the stern old British methods of phlebotomy, leeching, purging, and partaking of all that was nauseous, but receive my most startling confidence—the public don't believe in us as of old!

'You, my reverend cousin, have dissuaded us from educating Tom for your own profession; but that profession is still better than mine, for your benefice will benefit you to the end of life, while my fees are growing so steadily less that they will soon touch zero. You, Uncle John, draw a fearful picture of a non-litigious England; and I felt for you as you drew it. Yet my clients are still more pig-headed. Yours won't go to law; mine won't go to the doctor. Yes, I have at last reached the nethermost depth—the public will not sicken as it used to do. When I was walking the hospitals, zymotics were as regular as the tides; and all the year round, fevers and agues went their profitable course. Everybody had a bad cold at least once in the winter. Gout and rheumatism were solid annuities to most of us. Broken limbs were fairly common in most families. In short, as the proverb ran, "the doctor was never out of the house." Alas, all that has gone! People take such ridiculous care of themselves; "sanitation" is the chatter of every nincompoop; and the fuss about clean cowsheds, pure water, pure air, and the rest, is cutting off the doctor's income at the roots.—Have I said enough, dear friends, to prove to you that Tom cannot be a doctor?'

Tom's father fell into his chair overcome with his own rhetoric; Tom's mother furtively wiped two tributary tears from her eyes; the reverend cousin looked at the ceiling inquiringly; Uncle John frowned sardonically.

Uncle Lucas, the farmer, who had listened in

puzzled bewilderment to the recitals of his relatives, now got laisurously on to his feet, and broke in thus: 'Well, well, it's all over with gentlefolks, too, it seems to me. I thought that everybody was thriving but the poor farmers, and now I learn that our betters are no better off than ourselves! When our father made me a farmer against my inclination, I thought he was unfair. He had made you elder lads into gentlemen, and I felt slighted at being left among clodpolls in the village. But I begin to think I shall have the best of it after all. I am in no trouble to find careers for my two lads and three lassies. Since the labourers have begun to skulk over their work and to ask twice as much wages, I have taken the lads to help me. Well, we've pulled through a troublesome and disheartening time; and what's more, we've learned a lot. I tell you, we've found out how to make farming pay—by doing it ourselves, the lads in the fields, and the girls in the house and dairy. We've had to take hold of the rough end of the stick, truly. The girls had to give up many of the fal-lals that young ladies learn at boarding-school; and the boys had to wear corduroy and hobnailed shoes. But they are none the worse for the case-hardening they've got. Finer lads don't live in this shire; and as to the girls, they're as blitha as the birds; and that, I reckon, is as good a test of contentment as you can get.—Now, brother doctor, let me advise you what to do with your son Tom. The Church, the Law, and Medicine all shut their doors in his face. Open the gate of a field and turn him in to pick up what pasture he can find; and my word for it, he'll not die of hunger. Look at his big limbs and his love of action! Why, he is built for a husbandman. Even if you could put him to some gentlemanly way of making a living in town, he would not be so happy and so healthy as in the country. When he comes to spend a few days with us, the lad is in his element, and works with his cousins right handily. Put him in a field, brother, put him in a field.'

Uncle Lucas quite astonished his more cultured relatives by his long speech; still more, by the almost pathetic earnestness of his appeal.

The reverend cousin, who had smiled compassionately at the rude beginning of the harangue, grew attentive as it went on; and at the end, clapped his hands approvingly. 'Bravo, Uncle Lucas!' he cried; 'thou art the one wise man amongst us.—A farmer let Tom be, doctor. Churches may fall, legal systems vanish, the healing art be substituted by universal hygiene, but the tillage of the land must ever demand tillers. During the period of change that has set in so strongly, let us see what remains least affected by the mutations of time and circumstance. While man lives on the earth he must eat; and the purveyor of food, therefore, has a first lien upon all the productions of society. It flashed into my mind, as Uncle Lucas was speaking, that perhaps the greatest result of all the metamorphoses going on will be the sublimation of husbandry. From the beginning, it has been regarded as an inferior career, and has to a certain degree been shunned. The age of Feudalism has gone; the age of Gentility is going; the real age of Utility is coming. When

it is established, the husbandman will be duly honoured and duly rewarded, as the pre-eminence citizen, as the venerated conduit through whose limbs and brain that daily bread flows for which we are bidden to pray.'

A pause followed, during which Tom's father began to smile hopefully, and his mother regained serenity.

'We educated men,' said the reverend cousin, concluding the business, 'have not done our duty by your class, Uncle Lucas. We have kept our intellectual children from your business, to the great retardation of agricultural science. Now that the professions are no longer profitable, we shall send some of our best youth to your pursuits. We will begin with Tom. In the fields, he will find a career open to every talent that providence has endowed him with.'

Uncle Lucas prevailed, and Tom 'was turned into a field.' What the result will be in these times of agricultural depression, is a thing of the future.

SKETCHES.

I.

In the far village by the shining sea,
Where the white sails, snow-gleaming in the light,
Creep up the tidal river to the quay,
And land the glistening captures of the night;
At the shading to a close
Of the brightness of the day,
Have you forgotten, Lady Rose,
Our meeting on the lonely way?

II.

Beyond the dreamy townlet, where the trees
With linked branches, golden shadows spread;
Where sweet wind-flowery bend before the breeze,
And many an arum lifts her hooded head;
Where the early primrose blows,
Long we lingered, loth to part:
Have you forgotten, Lady Rose,
Our earnest converse, heart to heart?

III.

The mossy stonework of the ancient span
That bridged the clear brown waters of the stream,
Where round the stepping-stones the eddies ran,
And slipped away with many a sunny gleam.
Still beside the river grows
Starry-eyed forget-me-not:
Have you forgotten, Lady Rose,
The drooping, faintly coloured knot?

IV.

In the home-garden, where the ivy crept
Around the ruined coping of the wall,
When in mine own, your trembling hand I kept,
And in the silence heard the night-bird's call.
Drear and cold the evening's close,
Sorrow of an adverse fate:
Have you forgotten, Lady Rose,
That parting by the wicket gate?

ARACHNE AND MELISSA.

WHEN Anne was queen and 'Mrs Freeman' was her mistress, two ladies known to fame as Arachne and Melissa came one day before the reading public. Those who are up in the literature of the time will remember their portraits, which expressed two well-defined and persistent types of humanity—those who get good from everything like Melissa, and those who draw only evil like Arachne. Now, each of these ladies has left behind her a long train of descendants—a wide-spreading *gens*, as the old Romans would have said—in the people who prefer to drink vinegar out of a leaden cup or wine out of a golden; who are to their surroundings as frost or as dew; who see the trodden backward path and the unsurmounted hills in front through spectacles tinted in black or in rose-colour; and who sing their Psalm of Life in the minor key, discordantly, or in the major, with full harmonies. These are the descendants of the Arachne (spider-born) and Melissa (honey-maker) who, in Queen Anne's time, sucked poison or gathered honey; and we meet them at all four corners of our way.

The Arachnides are for the most part characterised by a strange and chilling silence, when a few words would remove a painful impression or enlighten a dangerous ignorance. When they do speak, their words fall like vocal icicles which freeze and cut at the same time; and they contrive to make their good advice more painful than other people's rebukes, and to give their information the form of a sarcastic reproach in that you did not know it all before. Their presence in society reminds one of the winter whose 'Breath was a chain which without a sound, The earth and the air and the water bound.' Where they are, freedom flags and gaiety declines; and only the most robust of those moral pachyderms who oppose their thick insensitiveness to all outside influences whatsoever, can withstand the lethal effect of the Arachnides. Their small pale eyes wither; their pinched lips paralyse; their very smiles are the fracture of a crystal more than the visible sign of

a living, friendly heart; and they are the veritable 'freezing mixtures' of life. They take strong and unreasoning dislikes to quite innocent strangers and harmless acquaintances, and will not be convinced that they have no occasion to do so; they quarrel for a mere nothing with those who are so unfortunate as to be their friends and relations, and cannot be induced to make nor to receive an explanation. No one knows what has offended them, but all at once they become like anthropomorphous polar bears to those to whom they had been moderately human a little while before; and more intolerable than ever to those to whom they had been intolerable enough when things were at their best. Then they retreat into their own spiritual den to hammer away at that leaden cup from which they drink the deadly acid that vitiates all their life and destroys all their happiness. They make the worst of things in every direction. If a cloud has come across the sky of others' friendships, they do what they can to increase the trouble and to make that permanent which, by the nature of things and without their evil offices, would have been evanescent. They kill all the tender little sprouts of growing affection between two young people or two likely comrades; and what they cannot do by straightforward means, they do by crooked ones—which comes to the same thing in the end.

If any one is so ill advised as to take one of these Arachnides into his confidence, he is sure to smart for it. Has he complained of a common friend?—the grim confidant rasps the little abrasion till it becomes a gangrened sore, and never lets it alone till it has lost all power of healing. He does the same by the other—the one complained of—till what was a mere nothing in the beginning becomes a cancer which eats into the whole substance of their mutual love, and reduces it to something worse than death. At no time is one of these Arachnides a safe confidant; for so surely as the night follows on the day, so surely will your secret be divulged in one of these moments of pique and ill-temper for which the Spider-born are famous. Women of the Spider-born *gens* are

great in this kind of small treachery. Have you a false tooth?—a well-concealed twist of the poor weak spine?—a tress of hair that never grew on your own head?—a blemish on your shoulder beyond the line of the most *décolleté* dress, and to the world therefore as though it were not?—and has Arachne found out, or been told in an impulse of misdirected confidence, one or all these things? It is only a question of time. In time the whole of society will know the fact; and that perfect bit of porcelain which the Generals and the Colonels, the Bishops and the Archdeacons, admired so much, will ring cracked for ever after. You might just as well have advertised your secret in the *Times*; and so you find out when too late.

Egotist to their finger-tips, the Arachnides make their own small annoyances the one great thought of their lives. They do not make much account of their blessings, only of their misfortunes; and nothing is so large as a microscopic speck on one of their most luscious fruits. The fate of empires and the fall of nations are not so important as the change of a servant or the ill arrangement of a dinner. The loss of a hundred men in a battle does not touch them so much as the loss of a row of cabbages in their garden; and a burnt duster out of a set is a more serious affair in their eyes than a passenger-ship wrecked on the Cornish coast or a merchant-steamer burnt to the water's edge. On one thing only can they be made loquacious—on their own small sufferings. On these they will descant an hour by the clock, and more to come after. But speak to them of the heart-anguish of others, and they are unsympathetic, dumb, indifferent. Their fire burns for themselves alone; to all the world beyond they have only slag and ice to give.

As a physiognomical sign, the Arachnides do not often look you in the face. They glance rather than gaze with straight and level eyes; and they prefer the corners of their eyes to the centres.

How different it is with those others—those Melissides who drink their wine of life in deep draughts from golden cups; those singers of glad melodies; those lovers of their kind and rejoicers in the sunshine; those whose own joyous nature tints the whole outlook with rosy hues, eloquent of the fresh morning and the young day's hope! Wherever they are, things go more easily. They do not sniffer troubles to arise, but put their broad backs to the work when strength is required—handle the difficulty with their delicate fingers where tact is needed—and by the marvellous power of their genial tempers, smooth all ruffled feathers and still all angry seas. Seeing life as a mixed web, where rare silks are shot through with the coarse fibres of roughened hemp or common cotton, they prefer not to linger on the hemp nor to fret over the cotton. They think the good is as true as the bad; and where they cannot cure they do not contemplate. When two friends fall apart, they do their level best to bring them together again; and when the skin of the over-sensitive shows signs of abrasion and inflammation, they treat it with an anodyne, not an irritant. They are too frank to be untruthful; but they are too genial to be parsimonious of praise or pinched in the matter of

verbal accuracy. If a little embroidery can hide the poverty of the original stuff, well, they do embroider; and they think it no sin to expound a text already given. Thus they make a grudging admission on the part of A. that B. is not quite such a ruffian after all as Mr A. imagined, do as much good work as a positive statement that B. is a very fine fellow indeed, and A. has no fault to find with him anyhow. By which they knit up that weak bit of the rope, and the two friends, who had strayed so far apart, are hauled up into line as before.

When these workers in gold are, what common parlance calls friends, with the workers in lead, the former have a hard time of it. They are always at the point where the Arachnides are backing and the Melissides are pulling—where the one are trying to break and the other doing their best to hold. The Arachnite takes offence at a word, a look, a gesture, a thing done or not done; and the Melissite will not have it. 'Come, old fellow, what's up now?' he says in that round cheery voice of his which suggests honey and sunshine, or a strong west wind, or anything else you like both sweet and wholesome. Probably the Arachnite pinches his lips and says 'Nothing;' but 'nothing' does not answer the purpose, and an explanation is forced—if indeed that poor chilled soul can be forced into anything frank and human. If he cannot, then the other does his best to laugh away the cloud and to go on as before; but it all depends on the mood of the Spider-born whether this frankness will be an offence or a clearance—whether it will win the day or lose it for ever. Unlike the Arachnite, whose analogue is that liquid which, when it is struck or stirred ever so lightly, breaks at once into crystals, the Melissite is almost impossible to freeze. Even his anger has a touch of generous pity in it, in that a man should be such a fool or so wrong-headed; and where the one will not forgive the smallest mistake, the other will forget the gravest wrong and trust to better things in the future. Tender of heart, he nourishes all good impulses in himself, and recognises them with gladness in others; and essentially peace-loving, as the really strong ever are, he is slow to 'wash his spears,' and only when forced by self-respect, goes out to fight his foes. Generous as a master and genial as an administrator, he puts up with the worries and disappointments inevitable to his business, whatever it may be; not troubling the gods with his complaints because men are made of clay, and every now and then break in the handling and fly in the firing. On the contrary, he makes the best of things even when they are bad; and looks to the perfected work rather than to the abortive, which cannot now be mended. He believes in the doctrine of encouragement rather than in the theory of repression, and thinks when men know that they are trusted to do well, they do better than when they know that they are expected to do ill—with the handcuffs to follow. He has no great faith in gags and bearing-reins, whips and spurs, for any kind of team that he may have to manage. He trusts rather to the cheering voice and the guiding hand; and his choice of method is justified by its results. In all troublous times, the Melissite—he who looks at a man's circumstances from that man's own

standpoint, and not from one external, unintelligent and unsympathetic—escapes the doom accorded to the Arachnides, and lives in peaceful security where these others are not safe, however well protected. If such as he did not form what Matthew Arnold calls the remnant, society would stand still like the clogged wheels of a watch, and men would perish in the moral desert as they perish in the material. The righteous men who save cities are they who do good to their brother-men as well as they who pray to God; and 'his prayeth best who loveth best' is a phrase we all know by head, and some of us by heart and head as well.

In hours of doubt and danger, the Arachnite despairs; but the Melissite buckles to for the work of decision and deliverance, hoping while a ray of light remains, or a plank whole out of the wreck. The one cannot spell success; the other will not learn to say defeat; the one does not hold on, the other cannot be beaten off. Hence we seldom find the working Arachnides successful in life; and the bread which they have to bake for themselves is apt to be both scant in quantity and sour in quality. The others, on the contrary, for the most part succeed. They have not only a larger volume of life to bear them on, but they have also the art of making friends, such as those poor starved prison-pinchd souls do not know. They are thus backed by their own strength, and given a helping hand by the strength of others; where the Arachnides get no extraneous aid, and soon come to the end of their own power. Then they complain of their ill-luck, or speak of secret enemies who work in the dark against them; and, if women, they go into the sunless labyrinth of 'nerves,' by which they excuse their jealousy and ill-temper, their sourness and crossness. They say severely that no one knows what they suffer, save those who are in like manner afflicted, and that they alone can measure the pain they endure. Perhaps the good-tempered interlocutor thinks to himself: 'A little honey mixed in with all thy vinegar, O Arachnite, would soften much of thy misery and reduce thy misfortunes to zero; and the milk of human kindness set to make cream is a better spiritual drink than the poison thou distildest and the vinegar which makes thee thin; and the poor thin whey, which is but scum with all the cream and cheese and butter taken out, is bad nourishment for men or babes.'

IN ALL SHADES.

CHAPTER XXXI.

DELGADO had fixed 'the great and terrible day' for Wednesday evening. On Monday afternoon, Harry and Nora, accompanied by Mr Dupuy, went for a ride in the cool of dusk among the hills together. Trinidad that day was looking its very best. The tall and feathery bamboos that overhung the serpentine pathways stood out in exquisite clearness of outline, like Japanese designs, against the tender background of pearl-gray sky. The tree ferns rose lush and green among the bracken after yesterday's brief and refreshing thunder-shower. The scarlet hibiscus trees beside the negro huts were in the

full blush of their first flowering season. The poinsettias, not, as in England, mere stiff standard plants from florists' cuttings, but rising proudly into graceful trees of free and rounded growth, with long drooping branches, spread all about their great rosettes of crimson leaflets to the gorgeous dying sunlight. The broad green foliage of the ribbed bananas in the negro gardens put to shame the flimsy tropical make-believes of Kew or Monte Carlo. For the first time, it seemed to Harry Noel he was riding through the true and beautiful tropics of poets and painters; and the reason was not difficult to guess, for Nora—Nora really seemed to be more kindly disposed to him. After all, she was not made of stone, and they had an interest in common which the rest of the house of Dupuy did not share with Nora—the interest in Edward and Marian Hawthorn. You can't have a better introduction to any girl's heart—though I dare say it may be very wicked indeed to acknowledge it—than a common attachment to somebody or something tabooed or opposed by the parental authorities.

Mr Dupuy rode first in the little single-file cavalcade, as became the senior; and Mr Dupuy's cob had somehow a strange habit of keeping fifty yards ahead of the other horses, which gave its owner on this particular occasion no little trouble. Harry and Nora followed behind at a respectful distance; and Harry, who had bought a new horse of his own the day before, and who brought up the rear on his fresh mount, seemed curiously undesirous of putting his latest purchase through its paces, as one might naturally have expected him to do under the circumstances. On the contrary, he hung about behind most unconsciously, delaying Nora by every means in his power; and Mr Dupuy, looking back from his cob every now and again, grew almost weary of calling out a dozen times over: 'Now then, Nora, you can canter up over this little bit of level, and catch me up, can't you, surely?'

'If it weren't for the old gentleman,' Harry thought to himself more than once, 'I really think I should take this opportunity of speaking again to Nora'—he always called her 'Nora' in his own heart—a well-known symptom of the advanced stages of the disease—though she was of course 'Miss Dupuy' alone in conversation. 'Or even if we were on a decent English road, now, where you can ride two abreast, and have a tête-à-tête quite as comfortably as in an ordinary drawing-room! But it's clearly impossible to propose to a girl when she's riding a whole horse's length in front of you on a one-horse pathway. You can't shout out to her: "My beloved, I adore you," at the top of your voice, as they do at the opera, especially with her own father—presumably devoted to the rival interest—hanging ahead within moderate earshot.' So Harry was compelled to repress for the present his ardent declaration, and continue talking to Nora Dupuy about Edward and Marian, a subject which, as he acutely perceived, was more likely to bring them into sympathy with one another than any alternative theme he could possibly have hit upon.

Presently, they descended again upon the plain, and Mr Dupuy was just about to rejoin them in

a narrow lane, almost wide enough for three abreast, and hordered by a prickly hedge of cactus and pinguin, when, to Nora's great surprise, Tom Dupuy, on his celebrated chestnut mare Sambo Gal, came cantering up in the opposite direction, as if on purpose to catch and meet them. Tom wasn't often to be found away from his canes at that time of day, and Nora had never seen indeed that he had caught a glimpse of Harry and herself from Pimento Valley, on the zigzag mountain path, without noticing her father on in front of them, and had ridden out with the express intention of breaking in upon their supposed *little-dittle*.

Mr Dupuy unconsciously prevented him from carrying out this natural design. Meeting his nephew first in the narrow pathway, he was just going to make him turn round and ride alongside with him, when Nora, seized with a sudden fancy, half whispered to Harry Noel: 'I'm not going to ride with Tom Dupuy; I can't endure him; I shall turn and ride back in the opposite direction.'

'We must tell your father,' Harry said, hesitating.

'Of course,' Nora answered decidedly. '—Papa,' she continued, raising her voice, 'we're going to ride back again and round by Delgado's hut, you know—the mountain-cabbage palm-tree way is so much prettier, and I want to show it to Mr Noel. You and Tom Dupuy can turn and follow us.—The cob always goes ahead, you see, Mr Noel, if once he's allowed to get in front of the other horses.'

They turned back once more in this reversed order, Nora and Harry Noel leading the way, and Mr Dupuy, abreast with Tom, following behind somewhat angrily, till they came to a point in the narrow lane where a gap in the hedge led into a patch of jungle on the right-hand side. An old negro had crept out of it just before them, carrying on his head, poised quite evenly, a big fagot of sticks for his outdoor fireplace. The old man kept the middle of the lane, just in front of them, and made not the slightest movement to right or left, as if he had no particular intention of allowing them to pass. Harry had just given his new horse a tap with the whip, and they were trotting along to get well in front of the two followers, so he didn't greatly relish this untoward obstacle thrown so unexpectedly in his way. 'Get out of the road, will you, you there!' he shouted angrily. 'Don't you see a lady's coming? Stand aside this minute, my good fellow, and let her pass, I tell you.'

Delgado turned around, almost as the horse's nose was upon him, and looking the young man defiantly in the face, answered with an obvious sneer: 'Who is you, sah, dat you speak to me like-a dat? Dis is de Queen high-road, for naygur an' for buckra. <You don't got no right at all to turn me off it.'

Harry recognised his man at once, and the hot temper of the Lincolnshire Noels boiled up within him. He hit out at the fellow with his riding-whip viciously. Delgado didn't attempt to dodge the blow—a negro never does—but merely turned his head haughtily, so that the handle of sticks pushed hard against the horse's nose, and set it bleeding with the force of the sudden turn.

Delgado knew it would: the sticks, in fact, were prickly acacia. The horse plunged and reared a little, and backed up in fright against the cactus hedge. The sharp cactus spines and the long aloe-like needles of the pinguin leaves in the hedgerow goaded his flank severely as he backed against them. He gave another plunge, and hit up wildly against Nora's mount. Nora kept her seat bravely, but with some difficulty. Harry was furious. Forgetting himself entirely, he knocked the bundle of sticks off the old man's head with a sudden swish of his thick riding-crop, and then proceeded to lay the whip twice or three times about Delgado's ears with angry vehemence. To his great surprise, Delgado stood, erect and motionless, as if he didn't even notice the blows. Appeased by what he took to be the man's submission, Harry dug his heel into his horse's side and hurried forward to rejoin Nora, who had ridden ahead hastily to avoid the turmoil.

'He's an ill-conditioned, rude, bad-blooded fellow, that nigger there,' he said apologetically to his pretty companion. 'I know him before. He's the very same man I told you of the other evening, that wouldn't pick my whip up for me the first day I came to Trinidad. I'm glad he's had a taste of it to-day for his continual impudence.'

'He'll have you up for assault, you may be sure, Mr Noel,' Nora answered earnestly. 'And if Mr Hawthorn tries the case, he'll give it against you, for he'll never allow any white man to strike a negro. That man's name is Delgado; he's an African, you know—an imported African—and a regular savage; and he had a fearful quarrel once with papa and Tom Dupuy about the wages, which papa has never forgiven. But Mr Hawthorn *does* say'—and Nora dropped her voice a little—'that he's really had a great deal of provocation, and that Tom Dupuy behaved abominably, which of course is very probable, for what can you expect from Tom Dupuy, Mr Noel?—But still'—and this she said very loudly—'all the negroes themselves will tell you that Louis Delgado's a regular rattlesnake, and you must put your foot firmly down upon him if you want to crush him.'

'If you put your foot on rattlesnake,' Louis Delgado cried aloud from behind, in angry accents, 'you crush rattlesnake; but rattlesnake sting you, so you die.' And then he muttered to himself in lower tones: 'An' de rattlesnake has got sting in him tail dat will hurt dat mulatto man from Englar', still, dat tink himself proper buckra.'

Tom Dupuy and his uncle had just reached the spot when Louis Delgado said angrily to himself, in negro soliloquy, this offensive sentence. Tom reined in and looked smilingly at his uncle as Delgado said it. 'So you know something, too, about this confounded Englishman, you wretched nigger you!' he said condescendingly. 'You've found out that our friend Noel's a woolly-headed mulatto, have you, Delgado?'

Louis Delgado's eyes sparkled with gratified malevolence as he answered with a cunning smile: 'Aha, Mistah Tom Dupuy, you glad to hear dat, sah! You want to get some information from de poor naygur dis ebenin', do you! No, no, sah; da Dnpuys an' me, wa is not fren';

we is at variance one wit de odder. I doan't gwine to tell you nuffin' at all, sah, about de buckra from Englan'. But when mule kick too much, I say to him often: "Ha, ha, me fren', you is too proud. You tink you is horse. I s'pose you doan't rightly remember dat your own fader wasn't nuffin' but a common jackass!"

He loved to play with both his intended victims at once, as a cat plays with a captured mouse before she kills it. Keep him in suspense as long as you can—that's the point of the game. Dandle him, and torture him, and hold him off; but never tell him the truth outright, for good or for evil, as long as you can possibly help it.

'Do you really know anything,' Tom Dupuy asked eagerly, 'or are you only guessing, like all the rest of us? Do you mean to tell me you've got any proof that the fellow's a nigger?—Come, come, Delgado, we may have quarrelled, but you needn't be nasty about it. I've got a grudge against this man Noel, and I don't mind paying you liberally for anything you can tell me against him.'

But Delgado shook his head doggedly. 'I doan't want your money, sah,' he answered with a slow drawl; 'I want more dan your money, if I want anything. But I doan't gwine to help you agin me own colour. Buckra for buckra, an' colour for colour! If you want to find out about him, why doan't you write to de buckra gentlemen over in Barbadoes?'

He kept the pair of white men there, dawdling and parleying, for twenty minutes nearly, while Harry and Nora went riding away alone towards the mountain cabbage-palms. It pleased Delgado thus to be able to hold the two together on the tenter-hooks of suspense—to exercise his power before the two buckras. At last, Tom Dupuy condescended to direct entreaty. 'Delgado,' he said with much magnanimity, 'you know I don't often ask a favour of a nigger—it ain't the way with us Dupuys; it don't run in the family—but still, I ask you as a personal favour to tell me whatever you know about this matter: I have reasons of my own which make me ask you as a personal favour.'

Delgado's eyes glistened horribly. 'Buckra,' he answered with a hideous grin, dropping all the usual polite formulas, 'I will tell you for true den; I will tell you all about it. Dat man Noel is sou ob brown gal from ole Barbadoes. Her name is Budleigh, an' her family is browu folks dat lib at place dem eall de Wilderness. I hear all about dem from Isaac Pourtales. Pourtales an' dis man Noel, dem is bot' cousin. De man is brown just same like Isaac Pourtales!'

'By George, Unele Theodore!' Tom Dupuy cried exultantly, 'Delgado's right—right to the letter. Pourtales is a Barbadoes man: his father was one of the Pourtaleses of this island who settled in Barbadoes, and his mother must have been one of these brown Budleighs. Noel told us himself the other day his mother was a Budleigh—a Budleigh of the Wilderness. He's been over in Barbadoes looking after their property.—By Jove, Delgado, I'd rather have a piece of news like that than a hundred pounds!—We shall stick a pin, after all, Uncle Theodore, in that confounded, stuck-up, fal-lal mulatto-man.'

'It's too late to follow them up by the mountain-cabbages,' Mr Theodore Dupuy exclaimed with an anxious sigh—how did he know but that at that very moment this undoubted brown man might be proposing (hang his impudence) to his daughter Nora?—it's too late to follow them, if we mean to dress for dinner. We must go home straight by the road, and even then we won't overtake them before they're back at Orange Grove, I'm afraid, Tom.'

Delgado stood in the middle of the lane and watched them retreating at an easy canter; then he solemnly replaced the bundle of sticks on the top of his head, spread out his hands and fingers in the most expressively derisive African attitudes, and began to dance with wild glee a sort of imaginary triumphal war-dance over his intended slaughter. 'Ha, ha,' he cried aloud, 'Wednesday ebenin!—Wednesday ebenin! De great and terrible day ob de Lard comin' for true on Wednesday ebenin! Slay, slay, slay, an' leave not one libbin' soul behind in de land ob de Amalekites. Dat is de first an' de last good turn I ebber gwine to do for Tom Dupuy, for certain. I doan't want his money, I tell him, but I want de blood ob him. On Wednesday night, I gwine to get it. Ha, ha! We gwine to slay de remnant ob de Amalekites.' He paused a moment, and poised the bundle more evenly on his head; then he went on, walking homewards more quietly, but talking to himself aloud, in a clear, angry, guttural voice, as negroes will do, under the influence of powerful excitement. 'What for I doan't tell dat man Noel himself dat he is mulatto when him hit me?' he asked himself with rhetorical earnestness. 'Because I doan't want to go an' spoil de fun ob de whole discovery. If I tell him, dat doan't nuffin'—even before de missy. Tom Dupuy is proper buckra: he hate Noel, an' Noel hate him! He gwine to tell it so it sting Noel. He gwine to disgrace dat proud man before de buckras an' before de missy!'

He paused again, and chewed violently for a minute or two at a piece of cane he pulled out of his pocket; then he spat out the dry refuse with a fierce explosion of laughter, and went on again: 'But I doan't gwine to punish Noel like I gwine to punish de Dupuys an' de missy. Noel is fren' ob Mistah Hlawton, de fren' ob de naygur: dat gwine to be imputed to him for righteousness. In de great and terrible day, de angel gwine to pass ober Noel, same as him pass ober de house ob Israel; but de house ob de Dupuy shall perish utterly, like de house ob Pharaoh, an' like de house ob Saul, king ob Israel, whose seed was destroyed out ob de land, so dat not one ob dem left.'

THE MODERN PRIZE SYSTEM.

It may be accepted as a principle that the education question admits of no final settlement in a state of progressive civilisation. Methods and forms, possibly the outcome of much thought and effort, established in one age, become cumbersome or altogether valueless in the next. They are found unsuited to the requirements of the later period, during which a demand has arisen for other kinds of knowledge, or for more advanced

teaching in subjects previously treated in an elementary manner only. Hence it follows that the minds of enlightened nations become directed to educational matters with a certain degree of periodicity: from time to time the education question becomes a burning one.

The most superficial reader of the daily papers or magazines cannot fail to have been struck latterly by the increasing attention bestowed on such matters by the people of these countries. So decided an influence is exerted by these considerations on the public just now, that we find them furnishing a test in some districts for parliamentary or other representatives. At social and literary gatherings, such questions as the following are warmly discussed: Should the State provide and maintain schools for the people, or should these be largely left to individual enterprise, as at present?—Should State interference take the form it has done in recent educational experiments, wherein two universities and one gigantic scheme of intermediate education have been framed on the lines of mere examining boards, disbursing public prize-money?—What is the relative value of the kinds of instruction ordinarily given in schools?—How may the desire for information be aroused among the masses, and in what way may the stimulus be best applied?

These and other questions of a kindred nature occupy the thoughts of many at this time. It is not our present purpose to deal with the whole question of education, but to consider very briefly one aspect of it—namely, prizes and their distribution.

If we inquire what inducements are offered to pupils to excel in special subjects or to proceed to higher branches of them, we find that the same general plan is followed in all our institutions, from the most elementary to the highest—namely, money prizes or their equivalent in books or medals, the obtaining of which presupposes a competitive examination. In most instances, the prize-money is paid in cash to the successful candidate. The age in which we live is eminently competitive, a fact early recognised by children at school, and still better understood in after-life. In comparing ourselves with our neighbours, may it not be a fact that we are over-examined people? We may further ask, are examinations always fair tests of ability? Is the reward system, as we have it, the best means of promoting a higher culture?

Those who have had any experience at all of examinations must have been over and over again surprised at the order in which candidates known to them are placed on the Honour list. There is a certain element of chance about examinations rapidly conducted, that cannot be eliminated, and which may lead to the disappointment of the most confident hopes. A diligent student, who has perhaps overtaxed himself physically in preparation for, or who is over-anxious about the examination, fails utterly, or is surpassed by some one of very superficial attainments. It seems to us that the verdict of a teacher, or, to prevent favoritism, of several teachers, as to the relative merits of the pupils long under their training and observation, has some advantages over the examination method at present in vogue, success in which is as often attained by an

unhealthy effort of 'cramming,' as by patient and honest study. Doubtless, examinations for some purposes cannot be entirely dispensed with, but must remain as necessary evils. Still, their frequency could be reduced considerably with decided benefit to the physical, and possibly also to the intellectual, condition of the rising generation.

The second part of our question remains to be considered: Is the present reward system the best means of promoting higher culture? Let us suppose a case. There is a class of twenty pupils engaged upon a subject for which a valuable prize is offered. Possibly seventeen of these, from their former experience of their class-fellows, conclude that the prize lies between the remaining three, and that there is no use trying for it. The prize and perhaps the subject also have no longer any interest for them; they cease to study, or at all events do little. The three amongst whom the prize lies are the most diligent, who probably like the subject, or learning generally for its own sake, or who, from vanity or ambition, are anxious to excel. These are they to whom the stimulus is applied; but they are the very pupils that need no further stimulus. The spur is virtually withheld from those requiring it, and applied to those who need it not.

If it be conceded that the need of reform is indicated in such cases, we must avoid rushing to the opposite extreme in trying to effect it. No one will suggest that the method of reward as applied to donkey-races would meet the case. With our present light, we are not prepared to recommend a thorough-going remedy. Much may, however, be done for the cause of true culture by modifying the distribution of prizes. The current notion of a prize is, that it is a reward for something well done, due as soon as the meritorious act is accomplished. Etymologically considered, the word conveys nothing more than that. A higher estimate of the function of a prize might advantageously be substituted for the one implied in the above definition. If it were regarded as not merely a reward for something past and done, but also as a stimulus to further effort in the same direction, more lasting good might be effected, and a modification of the present system of distribution would become a necessity. For example: a large money prize obtained in a junior school, instead of being paid directly to the successful candidate, might be divided into two unequal sums, the smaller to provide a medal or book, &c., as a tangible evidence of distinction; the larger, to be applied as fees at a neighbouring high-school or college where the favourite subjects could be studied for a longer period free of cost to the pupil. The payment of the larger instalment could be made contingent upon the successful candidate desiring to prosecute his studies further. In the event of the pupil electing to abandon study in favour of trade or business, or from mere disinclination, the medal, book, &c., showing the position attained, might alone be presented, and the balance of the prize-money be forfeited.

Among other benefits resulting from this scheme we might instance—that cramming would be diminished to an appreciable extent. A common practice nowadays with many who enter for prize

examinations is to hurriedly prepare a large number of subjects, selected more with reference to their maximum of marks than to the tastes of the pupil, then to obtain the coveted prize, and subsequently to forget the mass of undigested information with which their memories have been snuffed, possibly never to return without disgust to the consideration of them.

We fancy such a modification as sketched above would influence favourably those who select a subject for its own sake and are desirous of knowing it perfectly. If successful in the elementary schools, the means are gained for following it up in a more advanced one till it is finally mastered, the information having been gradually imparted and more perfectly assimilated. On the other hand, the scheme would rather repel those alluded to before, who study hurriedly particular branches solely for the sake of the money to be gained, only so long as this is at once paid to them in the form of cash.

The plan recommended appears to be inconsistent with separate or private educational enterprises, many of which depend for their maintenance and efficiency on large fees. The want of uniformity in constitution and management of elementary schools, and the want of harmonious action resulting from the rivalry between them, scarcely offer the proper conditions for the full development of the plan. In a few large towns, where the relations between schools have rendered its introduction possible, it has been eminently successful. Pupils of marked intellectual power, belonging to the less opulent classes, have been induced by the operation of this system to proceed from primary to intermediate schools, and ultimately to the attainment of the highest distinctions at the English universities; following specially at each advancement the subjects of their choice.

Undoubtedly, a complete State-controlled educational scheme embracing all grades would render possible the general adoption of this method of applying large money prizes. In offering this suggestion as a plea in favour of State education we must bear in mind that the State system depends for its favourable reception on considerations of much greater moment, which cannot in our present limits be discussed.

TREASURE TROVE.

A STORY IN FOUR CHAPTERS.—CHAP. III.

AFTER a sleepless night of suspense and dread, Bertha, who was always up first in the little household, lingered in her room until long after her usual time, not daring to descend, for fear of meeting Jasper Rodley, and only did so at the personal summons of her father, who assured her that their visitor had gone.

Contrary to his usual habit, the captain was silent during breakfast; and the girl's heart, which had been brightened partly by the departure of Jasper Rodley, and partly by the thought that it was Wednesday, interpreted the silence of her father as ominous. After breakfast, she began to prepare as usual for her weekly visit to Saint Quinians' market.

'Bertha,' said her father, who had lighted his pipe and was stamping up and down the room, 'don't hurry to-day. An hour or so cannot make much difference. I want to speak to you.'

Pale and trembling, the girl took her seat at the open window, through which streamed the early sunshine.

'Jasper Rodley was talking to me for a long time last night,' continued the old man. 'I think he is a nice young fellow, and I am sure you have made an impression on him.'

Another person better versed in the art of approaching a delicate subject would have chosen a more circuitous mode of procedure; but the simple, blunt, old sailor knew very little about conversational wile and artifice, and could only go straight to the point.

Bertha did not answer, but sat motionless, with her eyes fixed on the shining rocks and the tumbling sea beyond.

So her father continued: 'And I don't think you could do better, in case he should make any proposal to you about—about marriage, than accept him. In fact, it is my wish that you should do so.'

Bertha remained silent for some moments; then she moved from her seat, placed herself on the stool by her father's side, took his hand in hers, and said: 'Father, my dearest wish is to please you and to do all that you wish. I have but one other friend in the world besides you, and no other relation. You have been the best of fathers to me, and I have tried to be a good daughter to you; but I cannot, oh, I cannot obey you in this!'

'But, my lass,' continued the old man, who was evidently moved by the earnest manner in which the girl spoke, 'Jasper Rodley is a man of a thousand—good-looking, of respectable birth, and doing well. He would make you happy, and another important thing—he would not take you from me.'

'Oh, it is not that, father—no, no!' exclaimed the girl.

'But you must have some reason for not liking him?'

'Yes; I have the best of reasons, father. In the first place, you know very little about him, or you could not speak so highly of him as you do. He is a man of doubtful character, as you may find out by asking any one in Saint Quinians. In the second place, I—I don't love him, and could never get to love him, or even like him. And in the third place—'

'Well, lass, well?'

'In the third place, I am betrothed to another.'

'Betrothed to another!' exclaimed her father in amazement. 'Why, that is impossible! You never see any one; no one ever comes here; and I cannot believe that all this time you have been deceiving me by carrying on a secret acquaintance, when you have so often protested that you live for me, and me only.'

'I have never dared tell you, father,' cried the girl. 'But it is a weight off my mind, now that you know. And, father, remember that I am not a child, and that, fond as I am of you and the old home, I could not go through life without some love of another kind than that I feel for you.'

Bertha had never spoken to her father in this style before, and the old man looked at her with mingled astonishment and reproach. Then he said: 'Bertha, I have particular reasons for wishing you to marry Jasper Rodley: I am in his power.'

The girl recalled what Rodley had said to her on the previous Wednesday, and knew now that there was a mystery in which her father and Rodley were involved, a mystery which instinctively filled her with dread that, during all these years of peace and quiet, something had been enacted between them which had been carefully kept from her, and that the interview of the previous evening was but the climax of a long-gathering storm. Many little changes in her father's manner and habits during the past four years had mystified her; now they were partially accounted for, and yet, to her recollection, she had never seen Jasper Rodley before the present month.

'In his power, father!' she exclaimed. 'How can you be in his power?'

'That I cannot even tell you, my loved one.'

'If you went out into the world, and had business dealings with other men, I could perhaps understand that you, being so simple and good-minded, might be drawn into the power of bad men, father,' cried Bertha. 'But you see none but me; you get no letters; you never go even into Saint Quinians, and yet you are in the power of a stranger!'

The old man shook his head, and continued: 'It is kind of you, Bertha, to say that I am good-minded; but I am a rogue.'

'You a rogue—my own, good, dear father!' exclaimed the girl. 'No, no! Were a hundred Rodleys to swear on their knees that you were a rogue, I would tell them they lied!'

'Yet, it is true, lass,' said the old man sadly; 'and it is to save me from the consequences of being a rogue, that I ask you to accept Jasper Rodley's offer of marriage. You have a week in which to decide.'

'A week! Seven short days!' cried his daughter, springing from her seat. 'But there is time. I must go, father, now; don't keep me, for every minute is of value.'

The old man would have said something; but she hurried from the room, and in a few minutes had started.

Never before had the four miles between home and Saint Quinians seemed so long to Bertha; never before had she trod the familiar road unmindful of the beauties of nature around her, and on this April morning nature was very beautiful; but she had no eyes for the majestic green waves splintering into clouds of spray on the shining rocks, for the white-winged birds riding on the swell, for the sweet-scented herbage, or the blue sky glimmering between the dark branches of the pines. Simply she gazed on the

gray-walled, red-roofed old town ahead of her, at the entrance of which some one would be waiting to greet her with open arms and glad smile. And her heart felt a little sinking as she gained the sandy eminence whence she generally got a first sight of his figure coming to meet her, and saw no one! She was later than usual, certainly; but he would have waited for her, she felt assured. He was not under the archway, nor coming up the street from the market-place; nor, when she arrived at the market-place, could she descry him anywhere.

'Ah, Miss Bertha!' said one of her market-friends. 'And how's the poor young gentleman gettin' on?'

'The poor young gentleman!' repeated Bertha. 'Why, Mrs Hardington, who do you mean?'

'Why, who should I mean but Mr Symonds! Sure-ly you've heard of his a-bein' picked out of the South Fosse, half-dead and'—

Bertha almost dropped her baskets, and her blood ran cold within her; then, without waiting to hear further details, she hurried away to the office in which Harry was. The head partner received her with the utmost urbanity, and corroborated what the market-woman had said, stating, that when Harry did not appear at the office at the usual hour, a messenger was sent to his lodgings, who returned with the answer that nothing was known about him. Later in the day he was found lying insensible in the Old Town Ditch. The gentleman added, that although Harry had had a narrow escape, he was out of danger.

From the office, Bertha went to her lover's lodgings. The servant told her that Harry was in bed, very weak and excitable, but that the doctor spoke hopefully.

She sent him up a long written message, reproaching him with having kept the facts from her, and bidding him use no precautions for getting better, as she had urgent need of him, but avoiding all direct allusion to what had taken place at home. A painfully scrawled answer came back to her to the effect that the doctor had assured him that within a week he ought to be able to get out, and sending her all sorts of loving messages.

Brief as all this is to tell, Bertha found that she had spent nearly two hours since her arrival in the town in finding out about Harry, so that, when she turned again into the market-place to begin her purchases, it was the usual hour when she was due at home; and by the time she had finished, the church bells were chiming three o'clock. As she turned out of the arch on to the homeward road, she felt bewildered and upset by the events of the past few hours as she had never felt before, and the central figure in the midst of her mental confusion was that of Jasper Rodley. Instinctively, she associated him with what had happened to Harry. All the circumstances pointed to him as being the author of the harm—the anger in which the two young men had parted, Harry's avowed intention of getting an explanation from Rodley, and the discovery of the former in the Town Ditch a few hours later. To such an extent were her feelings worked up, that she dreaded arriving at home, for fear that Jasper Rodley should be there to meet her and to push his suit; and so,

resolving to linger as long as possible, she turned from the direct road over the sandhills, and struck into a more devious path, which led amongst the rocks on the edge of the sea.

So busy was she communing with herself that she did not observe the tide, which she imagined was receding, to be rising fast, and had proceeded for two miles before she noticed that she was cut off from the sandhills by a broad, deep, rapidly increasing sheet of troubled water. For a moment she hesitated, yet not from fear, for familiarity since early childhood with rocks and tides had saved her more than once from a similar predicament, and had made her an expert in rock-scrambling; but from the fact that her absence of mind had caused her to miss the right path. However, she quickly decided; and in spite of being heavily handicapped by the burden of two baskets, struck straight up a ledge of fantastic rock which, she seemed to remember, communicated even at high tide with the shore. But, to her horror and dismay, when she arrived at the summit, she beheld a fast running, angry current separating her from the sand, upon which, not a quarter of a mile away, stood her father's house. There was nothing to be done but to make for the rocks which towered above her on her right hand, and which she could see were never touched by the waves. Once up there, and she was safe; but the getting there was a problem even for her with her youthful strength and activity. As the rising water was already lapping at her heels and would advance to a level some inches above her head, there was no time for delay. Before starting, she shouted, in order to attract the attention of some one in the house; but the wind was blowing in her teeth, and she knew that she would need all her breath for the climb before her.

It was a quarter of an hour's race with the tide. At each one of Bertha's upward steps, the green water seemed to make a step. More than once she slipped back, and was over her ankles in water; but at length she reached her haven, and sank down on a table of dry rock, utterly exhausted, her hands torn and bleeding, her dress in tatters and drenched with water, safe from a fearful death, but face to face with the prospect of having to pass long dark hours in a wild desolate spot, and at the risk of being discovered by some of the lawless characters who made the rocks their homes, their castles, and their storehouses.

It was some time before she was sufficiently recovered to examine her place of refuge. When she did so, she found that she was on the very edge of one steep cliff, and at the foot of another as high, but not so inaccessible. She was well above the water, for, clinging to the sides of the cliff and springing up between the clefts of the rocks, were thick stunted bushes, and even here and there the tinted head of a hardy flower. But suddenly her attention was drawn from the geography of her surroundings to the mark of a boot on the patch of bright sand behind the rock. A tremor seized her at first, for she imagined that she must have chosen a smugglers' haunt as her place of refuge; but her fear turned into joy when she noticed that there was but the impression of a left foot, and that the spot the right foot would have occu-

pied was marked by a hole such as the ferrule of a thick stick would make, and she knew that the traces were those of her father. The marks came up from below, and stopped abruptly at a thick bush. Something prompted the girl to stir this bush with her foot, and, to her surprise, it came away in a mass, and displayed an orifice in the rock just large enough to admit of one man passing. Her curiosity was now aroused, and overruling all considerations concerning her personal safety, and the advisability of getting home as soon as possible, she entered the opening, and found herself in a tolerably large cavern, the sandy floor of which was covered with marks corresponding to those outside, but which were especially numerous about a large round stone which, from its dissimilarity to the material of the cavern, seemed to have been brought from the beach below. Exerting all her strength, she moved the stone, and staggered back with an expression of amazement. On a wooden shelf placed in a hollow she beheld a dozen canvas bags, which, when she lifted them, clinked with the unmistakable sound of coin. But what startled her even more than the discovery itself was that each bag bore upon it, in half-effaced letters, the words, 'Faraday & Co., Saint Quinians.'

A terrible light now broke upon her. Faraday & Co. were the bankers in whose employ Harry Symonds had been when they were robbed four years previously of three thousand pounds in sovereigns; and she too well understood now what her father meant when he called himself a rogue, and what was the nature of the influence which Jasper Rodley had over him. She stood for some moments irresolute, sick at heart, her brain in a whirl, and every limb trembling. How should she act? Nothing that she could do would remove the fact that during the past four years her father had been making use of coin which belonged to other people, although, by taking the money away, she could screen him from the public shame of having it in his possession. Oh! she thought, if Harry could be with her but for five minutes to decide for her!

Daylight was fast fading away, so that every moment was of value. She decided that she would get home as soon as possible, tell her father of her discovery, persuade him to return the money to the bankers, making up the deficit which he had used, and informing them how and where he had found it. If this could be done without attracting the notice of Jasper Rodley, she might defy him to do his worst, and clear her father of all suspicion. So she replaced the stone, covered up the entrance to the cave with the bush, and followed the marks on the thin sand-path, which, to her joy led, over a ridge of rocks hitherto invisible to her, to the shore. Scarcely had she passed along, when the figure of Jasper Rodley rose from behind a rock close by the cavern entrance, his eyes bright with malignant satisfaction at having watched all her movements unseen.

Bertha found her father in a terrible state of anxiety, and she had to explain how she had been overtaken by the tide on her homeward journey, before she could broach the topic uppermost in her mind; and then, just as she was about to tell the captain of her discovery,

Mr Jasper Rodley walked into the room, and announced his intention of staying the night, so that she would have no opportunity of speaking to her father in private until the next day.

WONDERS OF MEMORY.

If 'all great people have great memories,' as Sir Arthur Helps declares in his delightful book entitled *Social Pressure*, it by no means follows that all those who are possessed of great memories are 'great people.' Many an instance might be cited to show that men of very moderate intellectual capacity may be endowed with a power of memory which is truly prodigious. In addition to this, there are plenty of well-authenticated examples of the extraordinary power of memory displayed even by idiots. In the *Memoirs of Mrs Somerville* there is a curious account of a most extraordinary verbal memory. 'There was an idiot in Edinburgh,' she tells us, 'of a respectable family who had a remarkable memory. He never failed to go to this kirk on Sunday; and on returning home, could repeat the sermon, saying: "Here the minister coughed; here he stopped to blow his nose."—During the tour we made in the Highlands,' she adds, 'we met with another idiot who knew the Bible so perfectly, that if you asked him where such a verse was to be found, he could tell without hesitation and repeat the chapter.' These examples are sufficiently remarkable; but what shall be said of the case cited by Archdeacon Fearon in his valuable pamphlet on *Mental Vigour*? 'There was in my father's parish,' says the archdeacon, 'a man who could remember the day when every person had been buried in the parish for thirty-five years, and could repeat with unvarying accuracy the name and age of the deceased, with the mourners at the funeral. But he was a complete fool. Out of the line of burials, he had but one idea, and could not give an intelligible reply to a single question, nor be trusted to feed himself.'

These phenomenal instances may be matched by the Sussex farm-labourer George Watson, as we find recorded in Hone's *Table Book*. Watson could neither read nor write, yet he was wont to perform wondrous feats of mental calculation, and his memory for events seemed to be almost faultless. 'But the most extraordinary circumstance,' says Hone, 'is the power he possesses of recollecting the events of every day from an early period of his life. Upon being asked what day of the week a given day of the month occurred, he immediately names it, and also mentions where he was and what was the state of the weather. A gentleman who had kept a diary put many questions to him, and his answers were invariably correct.'

Of a similar kind is the memory for which Daniel M'Cartney has become famous in this United States. The strange story of this man's achievements is told by Mr Henkle in the *Journal of Speculative Philosophy*. M'Cartney, in 1869, declared that he could remember the day of the week for any date from January 1827, that is, from the time when he was nine years and four months old—forty-two and a half years. He has often been tested, and, so far as Mr Henkle's account goes, had not failed to tell his questioner

'what day it was,' and to give some information about the weather, and about his own whereabouts and doings on any one of the fifteen thousand or more dates that might be named. When Mr Henkle first met this man of marvellous memory, he was employed in the office of the Honourable T. K. Rukenbrod, editor of the *Salem Republican*, where nothing better could be found for M'Cartney to do than 'turn the wheel of the printing-press on two days of each week.' On the first formal examination this man underwent, his answers were tested by reference to the file of a newspaper which gave the day of the week along with the date. In one case his statement was disputed, for the day he named was not the same as that given by the paper; but on further inquiry, it was found that the newspaper was wrong, for the printer had made a mistake. Short-hand notes of the conversation were taken at subsequent interviews. The report of these is very curious reading. Take the following as a sample. 'Question. October 8, 1828? Answer (in two seconds), Wednesday. It was cloudy and drizzled rain. I carried dinner to my father where he was getting out coal.—Question. February 21, 1829? Answer (in two seconds), Saturday. It was cloudy in the morning, and clear in the afternoon; there was a little snow on the ground. An uncle who lived near sold a horse-beast that day for thirty-five dollars.' And so the conversation ran on for hours, ranging over forty years of M'Cartney's personal history. Mr Henkle tells us that if he went over some of the dates again, after a few days' interval, the answers, although given in different terms, were essentially the same, 'showing distinctly that he remembered the facts, and not the words previously used.' M'Cartney's memory is not confined to dates and events; he is a rare calculator, can give the cube root of such numbers as 59, 319; or 571, 787, &c.; can repeat some two hundred and fifty hymns, and start about two hundred tunes; has a singularly extensive and accurate knowledge of geography, and never forgets the name of a person he has once seen or read of. With all this singular power of memory, however, he is not a man whose general grasp of mind is at all noteworthy.

The same may be said of scores of men whose one rich gift of memory has brought them into prominence. No one has claimed any high intellectual rank for the renowned 'Memory Corner' Thompson, who drew from actual memory, in twenty-two hours, at two sittings, in the presence of two well-known gentlemen, a correct plan of the parish of St James, Westminster, with parts of the parishes of St Marylebone, St Ann, and St Martin; which plan contained every square, street, lane, court, alley, market, church, chapel, and all public buildings, with all stables and other yards, also every public-house in the parish, and the corners of all streets, with all minutiae, as pumps, posts, trees, houses that project and inject, bow-windows, Carlton House, St James's Palace, and the interior of the markets, without scale or reference to any plan, book, or paper whatever; who undertook to do this same for the parishes of St Andrew, Holborn, St Giles-in-the-Fields, St Paul's, Covent Garden, St Mary-le-Strand, St Clement's, and St George's; who could tell the corner of any great leading thoroughfare from

Hyde Park corner or Oxford Street to St Paul's; who could 'take an inventory of a gentleman's house from attic to ground-floor and write it out afterwards. He did this at Lord Nelson's at Merton, and at the Duke of Kent's, in the presence of two noblemen.'

Turning, now, from examples like the foregoing, which have been given to show that a great memory does not argue in all cases any unusual mental power in other directions, let us look at some of the 'great people' whose 'great memories' illustrate the correctness of Sir Arthur Helps's dictum. Running over a long list of examples, which the writer has prepared for his own use in the study of this subject, he has been struck with the fact, that the last three or four centuries appear to much greater advantage in this review than any similar period which preceded them. This, after all, is not surprising, when the circumstances of modern life are carefully considered; but it is not in accordance with common opinion. There is a notion abroad that the power of memory has declined since the invention of writing, and especially since the invention of printing and the universal spread of cheap books and newspapers. Nothing could be more mistaken than such a supposition. If we do not nowadays use the memory as the only registry of facts within our reach, we do use the memory even more than the ancients, for the simple reason that our knowledge travels over an immeasurably wider area, we have more to remember, and, as civilisation and culture advance, a good memory becomes more and more needful for the work of life; the general level of intelligence is being raised, and mental power is developed from age to age. In this general advancement and growth, memory has its share.

The verbal memory displayed by the old Greek rhapsodists and bards, or the Icelandic scalds, was undoubtedly remarkable, and is often held up to the envy of these degenerate days. Yet the modern Shah-nama-Khans, Koran Khans, and other singers and reciters of Persia, who 'will recite for hours together without stammering,' and the Calmuck national bards, whose songs and recitations 'sometimes last a whole day,' cannot surely be a whit behind, if indeed they do not far surpass the prodigies of early ages. We are often reminded of Greek gentlemen who knew their Homer by heart, in the days when Homer occupied the field almost alone and there was little else to learn. But what are their exploits by the side of men like Joseph Justus Scaliger, who 'committed Homer to memory in twenty-one days, and the whole Greek poets in three months?' Cassaubon says of Scaliger: 'There was no subject on which any one could desire instruction which he was not capable of giving. He had read nothing which he did not forthwith remember. So extensive and accurate was his acquaintance with languages, that if during his lifetime he had made but this single acquisition, it would have appeared miraculous.'

Since the revival of learning in Europe, there have been scores, yea, hundreds of scholars who have known 'their Homer' by heart and a thousand other things besides. Bishop Sanderson, old Isaac Walton tells us, could repeat all the odes of Horace, all Tully's *Offices*, and the best

part of Juvenal and Persius. Euler the mathematician and Leibnitz the philosopher could recite the *Æneid* from beginning to end. In their day, Porson, Elmsley, Parr, and Wakefield, held the foremost place as scholars, and all, of course, had rare memories; but the palm must be given to Porson, of whom endless stories are told. Before he went to Eton, he was able to repeat almost the whole of Horace, Virgil, Homer, Cicero, and Livy. When, as a practical joke, a school-fellow slipped the wrong book into Porson's hand, just as he was about to read and translate, the boy was not disconcerted, but went on to read from his memory, as if nothing had occurred. In later life, his performances approached the miraculous. It would require all our space to give any fair idea of them; for he not only knew all the great Greek poets and prose writers pretty well by heart, but could recite whole plays of Shakespeare, or complete books from *Paradise Lost*, Pope's *Rape of the Lock*, Barrow's sermons, scenes from Foote, Edgeworth's *Essay on Irish Bulls*, scores of pages from Gibbon or Kapin. He is also said to have been able to repeat the whole of the *Moral Tale of the Dean of Badajoz*, and Smollett's *Roderick Random* from the first page to the last.

Gilbert Wakefield's memory was also of the gigantic order, but it will not bear comparison with Porson's. There were few passages in Homer or Pindar which he could not recite at a moment's notice; Virgil and Horace he knew perfectly; and he could recite entire books from the Old and New Testaments without halting or failing in a single verse. There was also John Wyndham Bruce, whose leisure time was devoted to classical studies. His chief favourite was Æschylus, the whole of whose plays he had learnt by heart, including the twelve hundred lines of the *Agamemnon* collated by Robertellus. He knew his Horace in the same way, and was quite content, until one day he met with an old fellow-student at Bonn, who, when he made a quotation, would mention book, ode, and verse, remarking, that he did not regard any one as knowing Horace properly unless he could do that. Mr Bruce accordingly set to work at Horace again, and was not long before he could name the exact place occupied by a line in any of the famous odes. It would be hard to believe that Athenian lads could beat the English lads of fourteen years and under, of whom Archdeacon Fearon tells us in the pamphlet referred to above. It was the custom in the school to which he went for the boys to repeat at the end of one of the terms all the Latin and Greek poetry they had learnt during the year. The usual quantity for a boy to go in with was from eight to ten thousand lines, and it took about a week to hear them. 'One boy in my year,' he says, 'repeated the enormous quantity of fourteen thousand lines of Homer, Horace, and Virgil. I heard him say it.'

Ease in learning foreign languages is sometimes regarded as a mere matter of memory; while, however, this is not exactly true, it must be allowed, of course, that skilful linguists are endowed with powers of memory beyond the average. Here, also, we find that there are no examples in ancient times that will stand comparison with our great modern linguists. Our

modern facilities for travel and study place us at an immense advantage. Crassus, when praetor in Asia, was so familiar with the dialects of Greek, that he was able to try cases and pronounce judgment in any dialect that might chance to be spoken in his presence. 'Mithridates, king of twenty-two nations, administered their laws in as many languages,' and could herangue each division of his motley array of soldiers in its own language or dialect.

But what are such linguists as these by the side of the best examples of recent times? Keeping within the limits of the last hundred years, we have examples that have never been surpassed or even approached in former times. Sir William Jones knew thirteen languages well, and could read with comparative ease in thirty others. John Leyden, a very inferior man to his great contemporary, had a good acquaintance with fifteen of the leading European and Asiatic languages. Within the last few years we have lost two men who could have travelled from the hills of Connemara or the mountains of Wales to the Ural Mountains, or from Lishon or Algiers to Ispahan or Delhi, and hardly met with a language in which they could not converse or write with ease. The reader will most likely have anticipated the names of two of the most remarkable linguists this country has produced—George Borrow and Edward Henry Palmer. When Borrow was at St Petersburg, he published a little book called *Targum*, in which he gave translations in prose and poetry from thirty different languages. Besides speaking the native tongue of every European nation, Palmer was so perfect a master of Arabic, Persian, Hindustani, Turkish, and the language of the gipsies, that even natives were sometimes deceived as to his nationality. Mr Leland says that, one day in Paris, Palmer 'entered into conversation with a Zouave or Turco, a native Arab. After a while the man said: "Why do you wear these clothes?"—"Why, how should I dress?" exclaimed Palmer.—"Dress like what you are!" was the indignant reply—"like a *Muselm!*"

Viscount Strangford may be placed in the same category with these; and the 'learned blacksmith' Elihu Burritt, whose friends claim for him that he knew all the languages of Europe and most of those of Asia, must not be left out of sight. But even these do not touch the highest limit of linguistic skill and power of memory. The most scientific linguist we have to name, and one of the most remarkable for the extent of his acquisitions, is Von der Gabelentz, who seems to have been equally at home with the Suahilis, the Samoyeds, the Hazaras, the Aimaks, the Dyaks, the Dakotas, and the Kiriris; who could translate from Chinese into Manchu, compile a grammar or correct the speech of the inhabitants of the Fiji Islands, New Hebrides, Loyalty Islands, or New Caledonia. When we come to Cardinal Mezzofanti and Sir John Bowring, we find the 'highest record' as regards the mere number and variety of tongues that men have been known to acquire. No one can speak with absolute certainty as to the number of languages Mezzofanti could converse in with ease. Mrs Somerville says that he professed only fifty-two.

This brief review of the subject necessarily leaves out of account a vast number of the most extraordinary and interesting examples. Artists like Horace Vernet; mathematicians and calculators like Dr Wallis and Leonard Euler, or G. P. Bidder and young Colburn; musicians like Mozart; newspaper reporters like the unequalled 'Memory Woodfall'; literary men like Lord Macaulay and T. H. Buckle; chess-players like Paul Morphy and J. H. Blackburne, have accomplished feats of memory as marvellous as any of those which have been mentioned.

A TRICK AT THE HELM.

DEAR BOB,—Come and lend me a hand, like a good fellow. The regatta here takes place the day after to-morrow, and the *Redbreast* is entered for it. There will be a very fair show of other crack 'Fives' for her to try her speed against, and I am more eager than usual to carry off the first prize. I think I ought to do it, if I can get a first-rate hand like yourself to come and help. You recollect my telling you how that crack-brained Irishman O'Gorman offered to bet me a hundred pounds that he would carry off as many first prizes as I would this season, and how, in a moment of irritation, I took the bet? Well, it has come to this—that we have each won nine prizes, and that Dartmouth Regatta is the last of the season. He can't possibly be here in the *Cruiskeen Lawn*, and consequently, the regatta represents considerably more to me than the twenty pounds which they offer for the winning boat. The *Redbreast* is out and away the best five-tonner here at present; and unless some wonderful crack arrives between this and then, my first prize and my bet ought to be a certainty, bar accidents. But I want you. Your experience of this part of the coast is greater than mine, and will be invaluable to me; and though Phipps is with me, and is a right good fellow in a race, still, he has not your skill and knowledge. Besides these weighty reasons, I want very much to show you my new little craft, and to enjoy a good dusting down together once more. So, just pack your bag, and come for three days at least, if you can't spare more, to your old chum,

JACK HETHERINGTON.

Such was the letter—dated 'YACHT *Redbreast*, DARTMOUTH'—which the Honourable Robert Mervyne took from his pocket more than once to peruse, as the train rolled him along the lovely Great Western coast-line, in answer to his friend's appeal. He was a fine broad-shouldered fellow, had pulled in his College Eight at Oxford, and, since that semi-boyish period, had done a great deal of genuine yachting-work, especially in Corinthian matches in the lower reaches of the Thames, where he had acquired a skill and experience in the handling of small craft under racing canvas which fully justified the confidence which Hetherington reposed in

him. Moreover, the coasts of Devon were well known to him; and to the local knowledge of the pilot and the technical skill of the yacht-sailor, he added that quickness of resource which so often makes the gentleman the superior of the professional. He was delighted at the opportunity afforded him by his friend's letter, and had not hesitated a moment in complying with the request conveyed therein. They were, in fact, far too old chums for either to fail the other at a pinch; and though it was near the end of August, he would still have time to get back for the First. So he smoked his cigar and gazed out at the gleaming waters of the sparkling sea, as he whirled by Dawlish and Teignmouth towards the little old-fashioned town of Dartmouth, and allowed his thoughts to roam far ahead in pleasing anticipation of the delights of the coming struggle for the prize.

As the shades of evening drew on, the train ran into the neglected little station at Kingswear, and Mervyn found Hetherington waiting for him on the platform; but, to his surprise, there was a decided lack of cheerfulness on his countenance, which seemed to betoken some unpleasant news in the background. It was not long in coming forward. Hardly had his friend's modest bag been carried into the hotel—for the little *Redbreast* afforded poor accommodation for any but her owner—than the cause of his gloom came out.

'It is awfully good of you to come down, old chap,' he said; 'but I'm afraid it's a wild-goose chase after all, for I'm sorry to say that I can't possibly sail to-morrow. It's a dreadful nuisance,' he added, 'and a disgusting piece of roguesry to boot.'

'Why, what's the matter?' asked Mervyn in surprise. 'Have they disqualified the *Redbreast*, or knocked a hole in her, or what has happened?'

'No,' said his friend; 'nothing of that sort. It's a bit of dirty underhand scheming on the part of that fellow O'Gorman, confound him! Knowing that he could not get over from Ireland himself to try conclusions with me, he has got that cad Brewster, the fellow who owns the *Cockyollybird*, and made himself so notorious at Southampton—to come round and sail against me; and I hear from the Wight that he left there three or four days ago with one or two of his own set, vowing that he will show me the way round the course, and knock one hundred pounds out of me into the bargain.'

'Well, but,' said Mervyn, 'we ain't going to be frightened by Brewster's brag. Being abroad all this summer, I have not seen the *Cockyollybird*; but from her record, the *Redbreast* ought to have a very fair chance against her.'

'Yes, yes! It isn't that; though, I fancy, she's a trifle better than we are in running,' replied Hetherington. 'But after that disgraceful affair at Southampton, a lot of small yacht-owners, myself among the number, put their heads together, and signed an agreement never to race against him again. One or two of those men are in the harbour now, and they won't sail if he does, neither of course can I. I'm pretty sure that O'Gorman knew that when he got him to come round; and of course he knows it too.'

'Then why should he boast so loudly about beating you?'

'Oh, that's just to carry it off with a high hand, and appear to be ignorant of the fact.'

'And the *Cockyollybird* is in?'

'Well, no; she isn't; but she's entered for the race, and she is sure to be here, bar accidents.'

'She must look pretty sharp, then,' said Mervyn, 'or she may be too late. Keep your courage up, old chap! Perhaps she won't get in, after all. Lots of things may happen between this and to-morrow morning.—But look here! Suppose she *does* come in, what shall you do? You can't race—of course, I see that, and I'm sorry for it; but I should like a bit of a sail, after coming all this way, and I want to see how the little craft behaves.'

'Oh, by all means,' replied Hetherington eagerly. 'I had thought of that. I can't lie in harbour and see all the craft going out to race; and I don't think I could bear to see the racing going on without being able to join in it. I vote for getting under way early in the morning, and making tracks to the eastwards. I mean to lay her up with Camper and Nicholson, and there is nothing more to keep me out now, confound it!'

'Capital! that will suit me first-rate. What time do you start?'

'Oh, any time in the early morning will do. The tide will be flowing about four A.M. But I daresay you won't like to turn out as early as that.—Tell you what—you'd better choose your own time to come on board, and then you can rouse me out, if I'm not already up.'

'All right! But what about Phipps?'

'Oh, he won't come with us. I've told him about Brewster, and, of course, he's very sorry; but the Carmichael girls are here in a big family schooner with an uncle of theirs; and you may be sure Phipps wouldn't let that chance slip. So it will be just you and I, that's all. And now, let's jump into the punt, and go on board for ten minutes, just to show you the little craft.'

So the two friends paddled off to the *Redbreast*, which was lying snugly under the land by the railway with other small craft of similar size and draught; and after the peculiar excellences of her interior fittings had been inspected by the aid of the little swing-lamp—for it was now nearly dark—and dilated upon enthusiastically by her owner, they went once more ashore together to dine at the hotel, and pass the evening over a game of billiards at the neighbouring Yacht Club. But as they landed, their attention was attracted by a smart little craft making the best of her way up the calm waters of the land-locked harbour in tow of a steam-launch. Hetherington looked at her long and earnestly; at last he said: 'Ah, there she is! That's the *Cockyollybird*, and that's Brewster steering, confound him! It's all up now. We'll get out of this to-morrow morning.'

They dined; but their quiet game of billiards at the club was rudely broken in upon by the appearance of the objectionable Brewster himself, with a couple of friends of similar kidney, who had also most unmistakably been dining, and who, in addition to their natural bluster and vulgarity, made themselves more than usually

disagreeable by half-facetions and wholly offensive observations as to the victory which they intended to score on the morrow, and the humiliation which they would inflict on those who imagined that they could sail against them; while 'my friend O'Gorman' was frequently referred to by Brewster himself, evidently for Hetherington's benefit; and whispered personalities were greeted by the precious trio with loud bursts of drunken laughter.

'I'd like to pounce the fellow's head,' growled Hetherington to his friend, chafing angrily at the covert insults.

'Better let him alone,' said the other. 'There's no glory to be got out of a row with a drunken sweep like that. He knows he's an arrant cad, and it is that very knowledge which makes him carry on like this. Let's leave them to enjoy themselves in their own way; and we'll go and turn in, as we shall be up early to-morrow.'

So each went his way: Hetherington to his tiny yacht, the other to the hotel close by.

Mervyn was an ardent yachtsman, as has been said; and perhaps it was the anticipations of the morrow which made it impossible for him to take the rest which he had himself advised. Whatever the reason was, after tossing about for some hours in troubled and unrefreshing sleep, he finally found himself wide awake, and likely to remain so; and at last, jumping out of bed, he threw open his window and keenly inspected the weather. There was every prospect of a glorious day. He looked at his watch—it was about four o'clock. The sun had not yet risen; but the sky was clear and luminous with stars, and, as far as he could tell, there was a light breeze from the westward. He looked over the water. The riding lights of the crowded yachts were twinkling away, as if a town had sprung up in the night on the calm silent waters of the river. The hoarse hoot of a steamer caught his ear, and he could see her green eye winking at him as she made her cautious way in mid-stream to the expectant coal-hulk beyond. He could hear even the tinkle of her engine-room bell and the husky cry of 'Starboard!' from the pilot who was bringing her in; and as he leaned out of the window to follow her track, a man-of-war brig struck 'eight bells' with a clear musical ring, an example which was followed a second or two after by her consorts in the harbour, and by some few large yachts who conformed to naval fashion in this matter. He turned from the window and glanced into the dim room. At the other end was his bed, looking tumbled and unpromising, even in the gloom. He was too wide awake to turn in again. His mind was made up. The tide would be flowing; the wind seemed fair; he would dress and rouse up Hetherington, and they would get under way at once.

His determination was quickly carried out; and he soon found himself outside the hotel in search of a waterman to take him on board. This was by no means an easy task; but by the aid of a railway porter, he managed at last to knock up an individual, who consented, with many sleepy growls at the unusual hour, to convey him on board. Arrived alongside, he stepped lightly on the dainty deck, dismissing his early friend with a tip so largely in excess of that worthy's expectations, as to make him instantly regret not having named a sum double at least of that which he

had demanded. It was getting lighter now; and he took in at a glance the delicate lines, the admirable workmanship, and the business-like spars of the little craft, and then turned towards the hatch to rouse up his chum. But as he did so, he hesitated for the first time since leaving his bed. Hetherington was probably sleeping soundly. It would be a shame to spoil his sleep simply because he himself had failed to rest. He listened for a moment: he could hear Hetherington snoring away in the little cabin. Then another idea struck him. Why not get under way himself, without bothering Hetherington at all? Capital! it would be first-rate fun! He took a look round. The yacht was made fast to some private moorings, so he would not have to get her anchor up. He could easily make sail himself. Hetherington would be delighted to wake up and find himself at sea—that he was sure of. It was an admirable idea.

No sooner was the notion entertained, than it was put into execution. His rubber-soled shoes enabled him to walk over the deck with an entire absence of noise. He took off the sail-covers, and with his broad shoulders and muscular arms, he found no difficulty in hoisting her mainsail, though perhaps there was a wrinkle or two which he would have preferred to get rid of. Her head-sails were mere child's-play; and presently, he cast off her moorings, lowered them quickly overboard, and hurried aft to the tiller. With a gentle breeze from the north-west, the pretty boat yielded to the pressure of her snow-white canvas, and with an almost imperceptible incline to her mast, moved quietly out from the crowd of others among which she had been lying. Silently she slid through the placid and untroubled waters of the river, splashed with the white light of many a bright star, and with the redder gleams of the many riding-lamps, obeying every touch of her helm so readily as to send a thrill of pleasure through Mervyn's veins as he cleverly worked her into the open and pointed her head seawards. And indeed, with a lovely yacht beneath one's feet, with a fair wind, a calm sea, and a brilliant promise of dawn, the man must be sluggish indeed who does not experience a keen sense of enjoyment.

Once clear of the river and with a good offing, he turned her head eastwards, making a course for Portland Bill. The wind was, as he had imagined, in the north-west, and it being off the land, and by no means strong, the sea was extremely smooth and in places even glassy. The little beauty sped along on her course, making no fuss whatever, peeling the bright water evenly away from the polished surface of her sharp bow, and running it aft with a gentle little hiss, and only the faintest, dimmest suggestion of a shadowy wake astern. Mervyn would have liked to get her topsail up, but this he could not well attempt alone, and he feared to wake Hetherington, for, having got out of the harbour, he was now possessed with a boyish desire to see how far on his course he could reach before his chum awoke; however, the tide was in his favour, and he was making splendid way as it was, so, lighting his pipe, he gave himself up to all the exquisite enjoyment of the situation. The beautiful coast, with its brilliant colouring of vivid green and warm red, familiar to him as an oft studied book,

was itself a constantly changing object of interest and admiration; each trawler, with the early sun gleaming through the shining mists of morning upon her tanned canvas, was transfigured into a fairy barque, with sails of red and burnished gold. Even the long ugly steamers, with their graduated train of smoke fading away into the limitless haze astern of them, betrayed no vestige of their commonplace origin, but seemed to float in mid-air, shadowy and impalpable, throwing ever and anon a gleam of light from off their bows, more like a flash of summer lightning than the foam of churning water; while the buoyant motion of the little craft beneath him, the noiseless speed with which she sliced her way through the dimpling wavelets, the instant and intelligent response which she gave to the faintest movement of the helm, left him absolutely without a shadow to dim his sense of placid contentment.

Ho began to hope that Hetherington would sleep on for ever. So he smoked on, and noted with satisfaction that with the rising sun the breeze was freshening fast: little waves now lifted up their smiling heads and plashed playfully at the pretty craft as she cut through them; the tall mast inclined more decidedly before the eager wind; and the foot of the mainsail began its welcome chorus of flip-flip, flip-flip-flip as the breeze poured out of it. Berry Head was long past; Torbay was crossed; the Thatcher and the Oarstone were left faint and filmy in the far distance on the port quarter, and now the little vessel was getting a trifle more lively as the water deepened and the wind increased and the shore receded further and further; and still Hetherington slept. Mervyne could still hear him snoring at times. It was rather odd, he thought. Lazy fellow! He need not have been so careful not to wake him. He wondered what time it was. He took out his watch. Eight o'clock! And he was getting hungry too. He had better wake him; so, without leaving the helm, he began thumping over his chum's head on the deck with a stick. 'Hi! Hetherington! Jack! Wake up! Turn out! Get up, you lazy dog! Eight bells, do you hear?'

But not a sound did he evoke in response; only, as he stopped and listened, the same loud snoring broke upon his ear. Very odd! Hetherington was not usually so late or so heavy a sleeper. Next he slid back the hatch and shouted loudly to his chum to rouse up. Still no answer—still the same stertorous breathing.

'Why on earth don't he wake?' said Mervyne to himself, and, trusting the yacht to steer herself for a moment or two, he dived down the little hatchway and entered the tiny cabin. It was empty! He stared around in blank astonishment, nearly amounting to dismay, and as he did so, a snore of almost gigantic volume assailed his ears. It came from the fore-cabin. This was more surprising than ever, for Hetherington, he knew, had no crew on board. An enthusiastic yachtsman, he, in true Corinthian spirit, worked his little craft himself, with the assistance of one or two good friends and fellow-spirits like Phipps—no paid hands being permitted on board during a Corinthian race—and even when cruising, scrubbed decks and polished brasswork with his own hands, sleeping also on board in harbour, unlike men of more luxurious habits, who

generally preferred the comforts of a hotel to the straitened accommodation of a five-tonner, even when it was their own.

Where, then, was Hetherington? and who was the occupant of the fore-cabin? He slid aside the little door which separated the cabin from the quarter assigned to the crew, when such an individual existed, and looked in. It was very dark in the little close den, but he could just discern a hammock stretched fore and aft under the deck, and in that hammock a bearded being sleeping a riotous sleep. He went up to the hammock and shook it. 'Here! rouse up, here! Where's your master?' he cried.

The figure grunted, shifted its position slowly and uneasily, and seemed inclined to settle once more into repose, but the shaking being repeated and continued with increasing violence, a weather-stained, lurid, and sodden countenance, set in a wild tangle of hair and beard, appeared over the edge of the hammock, and after staring stupidly with vacant eyes a moment or two into the gloom, inquired thickly and with gin-saturated utterance, 'Wash up?' and then falling heavily back on its pillow, instantly resumed its state of stertorous insensibility. The man was hopelessly and helplessly drunk. But who could he be?

At that moment, a terrible suspicion flashed through Mervyne's mind like an electric shock. He turned, and bolted through the little cabin and up on deck like a shot. The first thing that caught his eye as he faced aft was the brass rudder-head, and on it, in necessarily small letters, unperceived by him before, was the one word, *Cockpollybird*. It was the wrong yacht!

Hetherington and Phipps both agree in asserting that they never had such a race as that in which they won the first prize at Dartmouth; but the former also adds that that fellow O'Gorman gave a lot of trouble before paying up the hundred pounds.

CHINA GRASS-CLOTH.

THE well-known and popular China, or Chinese, grass-cloth, specimens of which, generally in the shape of handkerchiefs, are brought home by most travellers in the East, is now likely to become yet more popular and have a far more extensive market in Europe than was formerly the case. This China grass—*soie végétal*, the French call it—is the fibre, not of a grass, but of a species of nettle, the *Bahmeria nivea* and other specimens of the *urtica*. These nettles are carefully cultivated in China, where they grow in great quantities, as they do in India and Ceylon. In India, hitherto, unfortunately, no marked or diligent attempt at cultivation has been made. These *urticae* are perennial herbaceous plants, having broad oval leaves, with a whitto down beneath. They are also free from the stinging character of ordinary nettles. In Ceylon and India, where the plants grow wild, these nettles are cut just about the time of seeding, bleached by the assistance of the heavy night-dew and hot mid-day suns, and the fibres

gathered together and spun into ropes or thin twine, from which coarse matting is made. This primitive way of treating the nettles is not followed in China, and indeed the employment of the fibre-silk for commercial purposes seems to be a Chinese secret.

The government of India, seeing what a great benefit might be expected to arise could a practical and inexpensive method of gathering the 'vegetable silk' be found, offered some time back a reward to stimulate inventors in discovering an economical method for preparing the fibre of the China grass. Such discovery has at last been made; three French gentlemen have been successful in perfecting two different inventions which would seem to completely meet the existing difficulty. Messieurs Trémy and Urbain de Paris have invented a method for converting the fibres of the plants into *filasse* ready for spinning. This method, however, would not have been of much use had not a M. Favier constructed a machine for gathering these fibres by decorticating the stems of the nettles by means of steam. Thus, the fibre is not only collected cheaply and easily, but the glutinous matter adhering to it, and which proved such a stumbling-block to our manufacturers, is removed at the same time. It is difficult to exaggerate the importance of these inventions. The *artica* grows in immense quantities all over India; and now that the plant and its fibres can be utilised economically, doubtless much careful attention will be given to the question of cultivation and the harvesting of these nettles.

Not only is the texture of the cloth manufactured from this fibre very beautiful—it is principally remarkable for its splendid gloss and peculiar transparency—but it is extremely strong and durable. 'Belting' for machinery has already been made with China grass-fibre, and on being tested, it was found that it could bear a strain of eight thousand three hundred and twenty-six pounds to the square inch; whereas leather could only sustain a pressure of four thousand two hundred and thirty-nine pounds to the square inch. A piece of water-hose made of the same fibre was subjected to the high pressure of six hundred pounds to the square inch, and it was proved that it only 'sweated' as much as a good ordinary hose does under a pressure of one hundred pounds. So much for its strength and durability, two great advantages. And, moreover, it is probable, having regard to these proved facts, that, although the texture of grass-cloth is so light and transparent, it would offer a considerable and prolonged resistance to heat and flames.

As to its beauty, most of our readers have had many opportunities already of forming an opinion on this head. So soon as manufacturers and costumiers have had a sufficient time for experimenting, we may expect to see grass-cloth very generally used for dress fabrics, hangings, curtains, and in many other ways.

Should these inventions, when put to the test and tried on a large scale, be found to answer as well as the trial experiments, a little time is only wanted, when a most important and valuable industry will arise in India, and, more than probably, give work to many thousands

of hands at home. At all events, if all goes right, India will be the richer in the near future by many millions of pounds sterling. And it is even likely that serious attempts at acclimatisation and careful cultivation of these useful nettles will be made in other of our semi-tropical colonies and possessions.

THE POET'S TREASURES.

THE laughing streams all crystal bright,
How sweet their murmuring song,
As, strewn with blossoms and flecked with light,
They joyously dance along!
They glance through the valleys like silver wings;
They twinkle, they gleam, they shine;
And while my heart in rapture sings,
They whisper they are mine!

Like a maiden's tresses so sleek, so fine,
They ripple, and wave, and curl;
They blush 'neath the sunset like rosy wine,
And sing like a happy girl.
When, weary, I sink on the emerald sod,
They dimple, and seem to say:
'We are balm fresh flung from the hand of God;
Come, bathe in our fairy spray.'

The warbling birds are my minstrels all;
Ah! they know that I love them well,
For I hasten forth, when their voices call,
To forest or leafy dell;
On lucy-pines pinions they come and go,
Capricious, and wild, and free,
And I sing to the children of toil and woe
The songs they sing to me.

The trees are mine, and the humble flowers
That sigh 'mid the rustling grass,
When steeped in the fragrance of summer showers,
The amorous zephyrs pass.
When the world grows cold, and I turn away
From its fickle and loveless throng,
They nestle around me, and seem to say:
'We love you, poor child of song!'

They kiss the dust from my weary feet;
They tremble, and blush, and sigh;
And the bonny daisy, so fresh, so sweet,
A tear in her golden eye,
Scemeth to me, in her gown of white,
More lovely than all the rest,
With the beauty of summer in her sight,
And its sunshine in her breast.

I own not one inch of this land, not I,
Nor jewels nor silks I wear,
Yet, free to roam 'neath the azure sky,
I am wealthy beyond compare.
To the plodding worldling, let pomp and pride
And the treasures of earth be given,
While I rest content on the fair hillside,
Rich, rich in the gifts of heaven!

BLOCKADES AND BLOCKADE-RUNNERS.

For three-quarters of a century, England differed from the other great maritime states of Europe as to the way in which blockade should be defined. To begin with, it may be enough to explain that a territory is said to be blockaded when access to or egress from its seaports is prevented by the naval forces of another state. When a state, for purposes of its own, fiscal or hygienic, declares that certain of its own ports shall be closed against foreign vessels, that decree must be respected by other states to whose notice it is duly brought, provided that those ports are really under the control of the executive of that state. But that is not a blockade; it is a mere closure of ports, which any government, in virtue of its inherent sovereignty within the borders of its own territory, is quite entitled to announce. Blockade is essentially a war measure. When the President of the United States, in April 1861, proclaimed that a forcible blockade of the Southern States would be forthwith instituted, England and France immediately declared their neutrality, and although that meant that they recognised the Confederates as belligerents, and not as rebels, their action was unobjectionable, because, whenever the Northern States issued that proclamation, they by implication admitted that they were engaged in war, and not merely in the suppression of a rebellion. In recent times, however, recourse has been had to what has been termed 'pacific blockade'; thus, the coasts of Greece were blockaded in 1827 by the English, French, and Russian squadrons, although all three powers professed to be at peace with Turkey (under whose dominion Greece then was); and from 1845 to 1848, France and England prevented access to La Plata, although no war was declared. To admit such procedure as legitimate would simply mean that one state might put in force against another measures destructive of the trade of neutral countries, and yet expect those countries to view the whole operations as pacific. This objection might not apply to that pacific blockade which we have this year

seen put in force against Greece, for we know that every vessel flying the flag of any other state than Greece has been unmolested. But the liberty allowed to other nations did nothing to mitigate the coercion applied to Greek trading-vessels, and had the object of the blockaders been merely to divert to their own merchantmen the carrying trade of the Archipelago, they could scarcely have devised a measure better fitted to attain that end. Lord Palmerston at least had a decided opinion as to how far such action was in accordance with law: his own words are: 'The French and English blockade of the Plata has been from first to last illegal.' In truth, pacific blockade is a contradiction in terms. In practice, it is enforced by the same methods as blockade between belligerents; and a recent Dutch writer has well pointed out that the sole reason why it has not yet met with the unanimous disapproval of European powers is that hitherto it has been levelled against only the weakest states.

It had from time out of mind been reckoned a perfectly regular proceeding to declare a port or a territory under blockade, and to affix penalties to the violation of that declaration, although, in point of fact, not a single vessel should be present to enforce its observance. But gradually this tenet met with less toleration; and in 1780, when America and France were combined against England, the three great powers of the North, Russia, Denmark, and Sweden, entered into a league known as the 'Armed Neutrality,' with the object of evading the severe but ancient method of dealing with neutral commerce which Great Britain adopted. One of the articles which this confederacy agreed upon was: 'A port is blockaded only when evident danger attends the attempt to run into it'—a principle which boldly denied the right of any power to close by a mere edict a single hostile port. But Britain doggedly persisted in the exercise of a right which had undoubtedly the sanction of custom; and the maritime powers of Europe were to wrangle and recriminate through still darker years before agreement could be reached. On the 21st of

November 1806, Napoleon promulgated the famous Berlin Decree, which announced that every port in Great Britain was blockaded; and by an Order in Council, issued a year afterwards, the British government declared France and all the states which owned her supremacy to be subject to the same embargo. However far short the English performance might fall of their announced intention, the egregious pretentiousness of the French decree will be apparent enough to any one who remembers Macaulay's saying of the Emperor: 'The narrowest strait was to his power what it was of old believed that a running stream was to the sorceries of a witch.' Yet, both governments were only carrying to its logical issue the old doctrine which neither had renounced—that a valid blockade might be constituted by mere notification. It was only in 1856 that, with the express purpose of removing as far as possible the uncertainty which hung over the rules of naval war, the great powers concurred in the Declaration of Paris, which has been called 'a sort of doctrinal annex' to the treaty of that year. Important as has been the operation of all the rules contained in that Declaration, the only one which concerns us here is the fourth; 'Blockades in order to be binding must be effective—that is to say, maintained by a force sufficient really to prevent access to the coast of the enemy.' This being practically an adoption of the principle for which the neutrals of 1780 had so strenuously contended, was an argumentative victory for them; but it was far more; it was a triumph for those thinkers who have always maintained that all law must rest upon a basis of fact, that except in so far as law declares the relation which ought to subsist between facts which a previous analysis has ascertained, it is useless, and even mischievous.

The first fifteen years of the present century were marked by all that turbulence which had characterised the closing years of that which went before, and there were not wanting in both periods instances of blockades perseveringly prosecuted and gallantly resisted. In the beginning of 1800, for example, Genoa was the only city in Italy held by the French; the Austrian troops invested it by land, and English war-ships blocked the passage seaward. The beleaguered Genoese saw the usual incidents of an old-fashioned blockade. From time to time, one of the light privateers which lay behind the little island of Capraja, north-east of Corsica, would succeed in eluding all the vigilance of Admiral Keith's squadron, and carry in provisions enough to prolong for a while the desperate resistance of Massena's garrison; and now the blockaders would retaliate by 'cutting out' a galley from beneath the very guns of the harbour. One day a gale might drive the jealous sentinels to sea; but on the next, they were back at their old stations, there to wait with patience until pestilence and famine should bring the city to its doom. Sixty years later and in another hemisphere, the maritime world was to see how far the new appliances of elaborate science had altered the modes in which blockades were to be enforced and evaded.

On the 27th of April 1861, President Lincoln issued a proclamation in which the following

announcement appeared: 'A competent force will be posted so as to prevent the entrance and exit of vessels from the ports' of the Southern States. 'If, therefore, with a view to violate such blockade, any vessel shall attempt to leave any of said ports, she will be duly warned; and if she shall again attempt to enter or leave a blockaded port, she will be captured.' All Europe was prepared to watch and to deride this attempt to lock up a coast-line of thirty-five hundred miles against the intrusion of traders, whose appetite for gain would be whetted to the keenest by artificially raised prices. Already, indeed, the scheme had been ridiculed as a 'material impossibility' by European statesmen, who pointed to the fact that not one of all the blockades established during the preceding seventy-five years had succeeded in excluding trade even where the coast to be watched was comparatively limited. But as a set-off against the long and broken stretch of coast which lay open to the operations of the blockade-runners, there were difficulties in their way which were at the outset of the struggle too lightly esteemed. Almost the whole extent of the seaboard was protected by a treacherous fringe of long low islands, scarcely rising above the surface of the water; the channels between and behind these were winding and intricate; and when these obstacles were passed, there still remained the crucial bar to imperil the entrance to every harbour.

The conditions of the impending conflict were new, and sagacious men foresaw that under them the risk of neutral powers being entangled in disputes with the belligerents was immensely increased. The agency of steam was to be employed for the first time to enforce a blockade on a gigantic scale. It was plain that a blockading squadron was no longer liable to be blown off the port it was watching by continued gales; but it was not so easy to say how far this new motive-power would alter the chances of the blockade-runners. The naval strength of the Northern States was at the beginning of the war so puny that the blockade when first instituted was little better than one of those 'paper blockades' which the voice of international law had condemned at Paris seven years before; for many months, indeed, the trade of the Confederacy with Europe was but little affected. It was in view of this that the *New York Tribune* urged Lincoln's government to economise their sea-force, and close entrance channels by means of sunken hulks. This plan was adopted at Charleston, and carried out under the superintendence of an officer whose aim was 'to establish a combination of artificial interruptions and irregularities resembling on a small scale those of Hell-gate,' that rock which so long impeded the navigation to New York harbour, and which was removed only a few months ago.

In Europe, both military critics and Chambers of Commerce protested against this barbarous method of making good a blockade; but the stone-laden whale-ships sunk at Charleston did no permanent damage to the port, for before the war closed, the hulks broke up, and the harbour was filled with floating timber. But it was quickly felt that only an adequate fleet could render the blockade effective, and in

response to the ceaseless activity of the dock-yards, the northern war-ships multiplied with marvellous rapidity. The blockade grew strict. Gradually, the pressure of diminished imports began to tell on the resources of the Southern States; iron, liquors, machinery, articles of domestic use, medicinal drugs and appliances of all kinds became scarce. In Richmond, a yard of ordinary calico which was formerly sold for twelve and a half cents, brought thirty dollars; a pair of French gloves was worth one hundred and fifty dollars; and the price of salt had risen to a dollar a pound. The export trade, too, was being slowly strangled; immense stores of cotton and tobacco lay waiting shipment at every port. A bale of cotton worth forty dollars at Charleston would have brought two hundred at New York; and some idea of the price it might have yielded at Liverpool may be obtained from a consideration of the fact that half a million of English cotton-workers were subsisting only upon charity.

But the war sent trade into new channels. Nassau, the capital of New Providence, one of the Bahamas group, became one huge depot for the goods which sought a market in the forbidden ports. Articles of household economy and of field equipment lay piled in heterogeneous masses on her wharves, the cotton which had escaped the grasp of the Federals lay in her warehouses for reshipment to Europe; her coal-stores overflowed with the mineral which was to feed the greedy furnaces of the blockade-runners lying at anchor in the bay, and the patois of every seafaring people in Europe could be daily heard upon her quays. Hardly less numerous and varied were the groups of sailors, merchants, adventurers, and spies, who discussed the fortunes of the war upon the white-glancing terraces of Hamilton in the Bermudas.

Blockade-running had now become a business speculation. But the great bulk of the trade was in very few hands, for the risks were great, and the capital involved was large. The initial cost of a blockade-runner was heavy; the officers were highly paid; a pilot well acquainted with the port to be attempted often demanded one thousand pounds for his services; and besides all this, it is to be remembered that on a fair calculation not above one trip in four was successful. It is computed that in three years there were built or despatched from the Clyde no less than one hundred and eleven swift steamers specially designed for the adventurous trade with the Confederate ports. Almost any day in August 1864, one of these vessels might have been seen cruising about at the Tail of the Bank, preparing to try her speed against the swiftest passenger steamers of the river. The *Douglas* was in those days the fastest boat on the Mersey; but one of the new blockade-runners, named the *Colonel Lamb*, easily beat her, attaining on the trial a speed of sixteen and three-quarter knots (or about nineteen miles) per hour. A careful observer might almost have guessed the character of the enterprise for which a blockade-runner was designed by a scrutiny of her build. Two taper masts and a couple of short smoke-stacks were all that appeared above the deck; her object was to glide in the darkness past her watchers, and the tall spars of a heavily-rigged

ship would have been too conspicuous a mark for eager eyes. Her hull was painted white, for experience showed that on dark nights or in thick weather that colour most easily escaped observation. Although she had considerable stowage-room, her draught was light, and she was propelled by paddle or side wheels, in order that she might turn readily in narrow or shallow waters. To aid their war-vessels in capturing and destroying light-heeled cruisers such as this, the Federal government built, twenty-three small gunboats. They, too, drew but little water, and rarely exceeded five hundred tons burden. For armament they carried one eleven-inch pivot-gun and three howitzers—two of twenty-four pounds, and one of twenty pounds—well-chosen weapons for the work they had to do. Their weak point was their rate of speed, which did not amount to more than nine or ten knots an hour. So deficient were they in this respect, that a blockade-runner has been known to run out, get damaged, and sail round a gunboat into port again.

There was so much in blockade-running that was attractive to the adventurous, that we are hardly surprised to learn that officers of our navy engaged in the work, wholly forgetful of the neutral position to which their country's policy bound them. The remonstrances, however, which were made to our government on that subject, and the Gazette Order which they elicited, would probably prevent those who had an official status from taking their capture so plegmatically as the youth who took his passage out in a blockade-runner with the intention of enjoying a tour through the Southern States, and who, when the vessel was captured, wrote home saying that he would now explore the Northern States, "which would do quite as well." One can well imagine the tiptoe of expectation to which every one on board would rise as the Bermudas sank into the distance, and the time drew near which was to decide the fortune of their enterprise. How warily they lie off until the evening favours their approach, and then, with every light but the engine-fires extinguished, speed quietly but rapidly past the large looming hulls of the outer blockaders. But they have yet to run the gantlet of the inner cordon of gunboats, and now comes the real crisis of their venture. Shall they steam with cunning effrontery slowly and ostentatiously close past a gunboat? The plan offers a chance of success, for some of their watchers have once been blockade-runners themselves, and in the darkness the similarity of build might deceive. No; they perceive what seems to be a practicable gap in the line, and driving their engines to their utmost pitch, they rest their fate upon their speed. Yet they are detected: there goes a heavy swivel gun; the alarm is raised, and now a perfect fusillade rages round the intruder. But everything is against good practice; only one shot takes effect in her hull, that going clean through the bow; and with little other damage, the daring vessel steams into Wilmington with a valuable cargo of liquors, leather, and iron.

Blockade-running soon became almost as much an art as a trade, and there were some grumblers in this country who made it a ground of complaint that no English officers had been sent to

observe the new development in this branch of naval warfare. The most ingenious expedients were resorted to on both sides. A system of signalling by means of blue lights and rockets was in many cases established between the forts and their friends in the offing. The steamer *Hansa* ran into Wilmington while Fort Fisher was being bombarded, and prevented pursuit by boldly sailing close past the powder-ship, which shortly afterwards blew up. Occasionally, a furious cannonade was begun from some adjacent fort, so as to draw off the blockading squadron, and leave the entrance free, if only for a few hours. The blockaders had their tricks too. Sometimes heavy smoke was seen rising as from a ship on fire; but when the blockade-runner steered to render help, she found out too late that the supposed burning vessel was a Federal cruiser, which had resorted to this device in order to bring the swifter craft within range of her guns. One dark rainy night the *Petrel* ran out of Charleston, and shortly afterwards fell in with what appeared to be a large merchant vessel. Hoping to crown a successful run with the capture of a valuable prize, she gave chase, and fired a shot to bring the stranger to. The reply was a single broadside, so well directed that there was no need for another. The supposed merchantman was the frigate *St Lawrence*. A favourite ruse of the privateer *Jeff Davis* was to hoist the French flag of distress, and when a ship bore down in response to this appeal, she would, under pretence of handing in a letter, send aboard a boat's crew armed to the teeth.

But of all the remarkable incidents of this remarkable blockade there was none more noteworthy than the voyage of the British ship *Emily St Pierre*. The story rivals the inventions of a sea-romancer. This vessel left Calcutta with orders to make the coast of South Carolina and see if the blockade of Charleston was still in force. Now, although this was a proceeding not in any way illegal, she was nevertheless captured by a Federal warship; a prize crew of two officers and thirteen men was put on board; and her own crew, with the exception of the master, the cook, and the steward, was taken out of her. Thus manned, she was being steered for a northern port, when her deposed captain persuaded his cook and steward to assist him in making one effort to regain possession of the ship. They caught the mate asleep in his berth, trussed and gagged him; the prize-master they found on deck, and treated similarly; three seamen who had the watch on deck were asked to go down into the scuttle—a storeroom near the helm—for a coil of rigging. The captain gave them this order as if he had accepted the inevitable, and was aiding the captors to navigate the ship. As soon as the three leaped down, the hatch was closed, and they were prisoners. The remainder of the prize crew, who were in the forecabin, were shut down and liberated one by one; but those who would give no promise of help to their new master were confined beside the unfortunates in the scuttle. Three, indeed, consented, but only one of them was a sailor; and with this crew of five, a vessel of eight hundred and eighty-four tons was brought to Liverpool through thirty days of bad weather. It is only a fitting conclusion to such a tale of

daring to record that the intrepid seaman who conceived and carried out the enterprise was a native of the stewartry of Kirkcudbright, which had already numbered among her sons the renowned Paul Jones.

IN ALL SHADES.

CHAPTER XXXII.

'This is awkward, Tom, awfully awkward,' Mr Theodore Dupuy said to his nephew as they rode homeward. 'We must manage somehow to get rid of this man as early as possible. Of course, we can't keep him in the house any longer with your cousin Nora, now that we know he's really nothing more—baronet or no baronet—than a common mulatto. But at the same time, you see, we can't get rid of him anyhow by any possibility before the dinner to-morrow evening. I've asked several of the best people in Trinidad especially to meet him, and I don't want to go and stultify myself openly before the eyes of the whole island. What the dickens can we do about it?'

'If you'd taken my advice, Uncle Theodore,' Tom Dupuy answered sulkily, in spite of his triumph, 'you'd have got rid of him long ago. As it is, you'll have to keep him on now till after Tuesday, and then we must manage somehow to dismiss him politely.'

They rode on without another word till they reached the house; there, they found Nora and Harry had arrived before them, and had gone in to dress for dinner. Mr Dupuy followed their example; but Tom, who had made up his mind suddenly to stop, loitered about on the lawn under the big star-apple tree, waiting in the cool till the young Englishman should make his appearance.

Meanwhile, Nora, in her own dressing-room, attended by Rosina Fleming and Aunt Clumny, was thinking over the afternoon's ride very much to her own satisfaction. Mr Noel was really after all a very nice fellow: if he hadn't been so dreadfully dark—but there, he was really just one shade too dusky in the face ever to please a West Indian fancy. And yet, he was certainly very much in love with her! The very persistence with which he avoided reopening the subject, while he went on paying her such very marked attention, showed in itself how thoroughly in earnest he was. 'He'll propose to me again to-morrow—I'm quite sure he will,' Nora thought to herself, as Rosina fastened up her hair with a sprig of plumbago and a little delicate spray of wild maiden-hair. 'He was almost going to propose to me as we came along by the mountain-cabages this afternoon, only I saw him hesitating, and I turned the current of the conversation. I wonder why I turned it? I'm sure I don't know why. I wonder whether it was because I didn't know whether I should answer "Yes" or "No," if he were really to ask me? I think one ought to decide in one's own mind beforehand what one's going to say in such a case, especially when a man has asked one already. He's awfully nice. I wish he was just a shade or two lighter. I believe Tom really fancies—he's so dark—it isn't quite right with him.'

Isaac Pourtales, lounging about that minute, watching for Rosina, whom he had come to talk with, saw Nora flit for a second past the open window of the passage, in her light and gauze-like evening dress, with open neck in front, and the flowers twined in her pretty hair; and he said to himself as he glanced up at her: 'De word ob de Lard say right, "Take captive de women!"'

At the same moment, Tom Dupuy, strolling idly on the lawn in the thickening twilight, caught sight of Pourtales, and beckoned him towards him with an imperious finger. 'Come here,' he said; 'I want to talk with you, you nigger there.—You're Isaac Pourtales, aren't you?—I thought so. Then come and tell me all you know about this confounded cousin of yours—this man Noel.'

Isaac Pourtales, nothing loth, pured forth at once in Tom Dupuy's listening ear the whole story, so far as he knew it, of Lady Noel's antecedents in Barbadoes. While the two men, the white and the brown, were still conversing under the shade of the star-apple tree, Nora, who had come down to the drawing-room meanwhile, strolled out for a minute, beguiled by the cool air, on to the smoothly kept lawn in front of the drawing-room window. Tom saw her, and beckoned her to him with his finger, exactly as he had beckoned the tall mulatto. Nora gazed at the beckoning hand with the intensest disdain, and then turned away, as if perfectly unconscious of his ungainly gesture, to examine the tuberose and great bell-shaped brugmansias of the garden border.

Tom walked up to her angrily and rudely. 'Didn't you see me calling you, miss?' he said in his harsh drawl, with no pretence of unnecessary politeness. 'Didn't you see I wanted to speak to you?'

'I saw you making signs to somebody with your hand, as if you took me for a servant,' Nora answered coldly; 'and not having been accustomed in England to be called in that way, I thought you must have made a mistake as to whom you were dealing with.'

Tom started and muttered an ugly oath. 'In England,' he repeated. 'Oh, ah, in England. West Indian gentlemen, it seems, aren't good enough for you, miss, since this fellow Noel has come out to make up to you. I suppose you don't happen to know that he's a West Indian too, and a precious queer sort of one into the bargain? I know you mean to marry him, miss; but all I can tell you is, your father and I are not going to permit it.'

'I don't wish to marry him,' Nora answered, flushing fiery red all over ('Him is pretty for true when him blush like dat,' Isaac Pourtales said to himself from the shade of the star-apple tree). 'But if I did, I wouldn't listen to anything you might choose to say against him, Tom Dupuy; so that's plain speaking enough for you.'

Tom sneered. 'O no,' he said; 'I always knew you'd end by marrying a woolly-headed mulatto; and this man's one, I don't mind telling you. He's a brown man born; his mother, though she is Lady Noel—fine sort of a Lady, indeed—is nothing better than a Barbadoes brown girl; and he's own cousin to Isaac Pourtales

over yonder! He is, I swear to you.—Isaac, come here, sir!'

Nora gave a little suppressed scream of surprise and horror as the tall mulatto, in his ragged shirt, leering horribly, emerged unexpectedly, like a black spectre, from the shadows opposite.

'Isaac,' the young planter said with a malicious smile, 'who is this young man, I want to know, that calls himself *Mister Noel*?'

Isaac Pourtales touched his slouching hat awkwardly as he answered, under his breath, with an ugly scowl: 'Him me own cousin, sah, an' me mudder cousin. Him an' me mudder is fam'ly long ago in ole Barbadoes.'

'There you are, Nora!' Tom Dupuy cried out to her triumphantly. 'You see what sort of person your fine English friend has turned out to be.'

'Tom Dupuy,' Nora cried in her wrath—but in her own heart she knew it wasn't true—if you tell me this, trying to set me against Mr Noel, you've failed in your purpose, sir: what you say has no effect upon me. I do not care for him; you are quite mistaken about that; but if I did, I don't mind telling you, your wicked scheming would only make me like him all the better. Tom Dupuy, no real gentleman would ever try so to undermine another man's position.'

At that moment, Harry Noel, just descending to the drawing-room, strolled out to meet them on the lawn, quite unconscious of this little family altercation. Nora glanced hastily from Tom Dupuy, in his planter coat and high riding-boots, to Harry Noel, looking so tall and handsome in his evening dress, and couldn't help noticing in her own mind which of the two was the truest gentleman. 'Mr Noel,' she said, accepting his half-proffered arm with a natural and instinctively gracious movement, 'will you take me in to dinner? I see it's ready.'

Tom Dupuy, crest-fallen and astonished, followed after, and muttered to himself with deeper conviction than ever that he always knew that girl Nora would end in the longrun by marrying a confounded woolly-headed mulatto.

(To be continued.)

THE ASCENT OF CLOUDY MOUNTAIN, NEW GUINEA.

BY CAPTAIN CYPRIAN BRIDGE, R.N.

THE Rev. James Chalmers—known all along the southern coast of New Guinea, throughout the original British protectorate in fact, as 'Ta-ma-té'—will always be held responsible for the first ascent of Cloudy Mountain. Taking advantage of the presence of Commodore Erskine's squadron at South Cape, he instilled into the minds of some of the officers a desire to get to the summit. With the persuasive eloquence of which his many friends know him to be a master, he expatiated on the honourable nature of the enterprise, dwelling on the fact that no white man had as yet attempted it. It is not wonderful that he excited considerable enthusiasm; nor is it, perhaps, wonderful that, as the climate is a moist one and as the warm tropical season was well advanced, some of the enthusiasm had greatly decreased

when the day for starting arrived. It was interesting to observe how many pressing engagements happened to prevent some of the more eager aspirants for alpine honours from attempting Cloudy Mountain, when the expedition was definitely determined on. One had arrears of correspondence to make up; another had promised to join a friend in a shooting excursion; whilst a third wisely took into consideration the fact of his being no longer young. It would have been well for at least one of the party that afterwards made the ascent if he also had remembered that the middle age is not the best time of life at which to try climbing almost precipitous elevations through trackless forests in the atmosphere of a hothouse.

On Friday, the 21st of November, the mission-jack had been hoisted, and the British protectorate over the southern coast of New Guinea had been proclaimed with imposing ceremonies on Stacey Island, South Cape. Time, which is usually deficient when naval officers visit places from which interesting excursions can be made, did not allow of the start for the summit of the mountain being deferred till the following day. It was compulsory to get away as soon as possible after the ceremony. Mr Chalmers, whom no exertion can tire, made arrangements for collecting a body of native carriers. He advised each excursionist to take a change of clothes, a blanket, and enough food for twenty-four hours. By about eleven A.M. there were assembled at the village of Hanod, at the head of Bertha Lagoon, the following: Captain C. Bridge; Lieutenants R. N. Ommamey and M. Thomson; Lt. Millist, captain's steward, of H.M.S. *Esperanza*; Commander W. H. Henderson; Lieutenant T. C. Fenton; Mr Glaysher, engineer; Mr T. W. Stirling, midshipman; four blue-jackets, and one R.M. artilleryman of H.M.S. *Nelson*; Lieutenant John L. Marx, commanding H.M.S. *Swinger*; Sub-lieutenant A. Pearson, of H.M.S. *Dart*; and Mr Stuart of Sydney, New South Wales.

The tribes inhabiting the country about South Cape are of the dark race, and were cannibals, until their recent renunciation of the practice, under the influence of the missionaries. They are a much merrier and more talkative people than the non-cannibal light-coloured race, which dwells farther to the westward. The work of selecting carriers proceeded with much vociferation; the carriers themselves, their friends, and all the ladies of the village—in this part of New Guinea the influence of woman is great—considering it necessary to address lengthy speeches in a loud tone to the white strangers. That not one of these understood a sentence of what was being said to them, by no means discouraged the eloquence of the villagers. 'Ta-ma-ti's' extraordinary faculty of influencing the natives in a cheery way soon introduced order into what looked very much like hopeless confusion. With the aid of the teacher Biga, who could speak both the Motu and the South Cape languages, he chose a sufficient number of carriers, appointed as guide an elderly native who professed to have been to the top of the mountain, and set about distributing the loads to be carried. The wages agreed upon were a small 'trade' knife and three sticks of tobacco, value in all about eightpence per man. Some biscuit and a little extra tobacco

were given afterwards, to keep up the spirits of the party during the journey.

Though not much troubled with clothes, our new friends were, at all events relatively to the western tribes, decently clad. The women wear a becoming petticoat of leaves and fibre, coming down to the knee. They often put on several of these garments one above the other, the effect being much the same as that of a capacious crinoline. In New Guinea, the women are tattooed from forehead to ankles, occasionally in very elaborate patterns. The name Papua given to New Guinea is said to mean 'woolly-headed,' and the appellation has been well bestowed. The men of both races 'tease' their hair out into a prodigious mop. So do the girls. Married women cut theirs short. The bushy wig which many of the natives of this region seem to be wearing decidedly improves their appearance. When their hair is cut short, the similarity of their features to those of African negroes becomes more obvious. They are not tall; but they have well-shaped limbs, and many of them are sturdy fellows. The usual weight for a native carrier is twenty-five pounds. But, as the number of travellers likely to ascend Cloudy Mountain had greatly fallen off, we found ourselves with more carriers than we could supply loads for. The result was that some at all events had very light burdens. One man, for instance, carried an empty tin case for specimens of plants; another, a few sheets of blotting-paper between two thin pieces of board provided for the same purpose.

When officers land in the South Sea Islands, nicety of dress is not much attended to. A helmet or straw-hat, a shirt, a pair of flannel trousers, and boots or shoes more remarkable for utility than elegance, are found quite sufficient. In a moist hot climate, the less clothing the better; and in countries in which there are no roads, not many paths, and where, as a rule, progress is only possible through thick forest and over muddy ground, the fewer garments worn, the fewer there are to be cleaned at the end of an excursion.

For the first half-hour after leaving the village on Bertha Lagoon, the way ran across a mangrove swamp of soft mud, interspersed with pools of black-looking water, and studded with the peculiar and aggravating knots that the roots of the mangrove bush delight to form. It was worth while to note the care with which most of the excursionists began to pick their way; some even evinced a desire not to wet their boots. To keep the nether garments clean was clearly in general considered an object worth trying for. But after a few rapid and involuntary descents from slippery logs, seductively resembling bridges, placed across the most forbidding sloughs, a determination to push on straight and discontinue efforts to circumvent puddles, became universally apparent. When the swamp had been left behind some distance, our carriers, who belonged to a humorous race, kindly informed us, through the interpreters—their faces beaming with delight as the information was imparted—that they could have taken us by a route which would have avoided it altogether. This statement was proved to be true on our return, as some of the party escaped traversing the swamp

a second time by taking a path which led to the westward of it, and others descended in canoes the lower part of a river that discharges itself into the lagoon. When asked why they had not let us know of the existence of a more agreeable road, our native friends made the unanswerable reply, that none of our party had suggested to them any wish to avoid the mangroves.

For an hour we had now to move along through a well-timbered country, occasionally passing small cultivated patches, where yams, bananas, and taro were grown. The path in most places was not difficult; but it lost itself from time to time in a stream of clear water, whose frequent rapids showed that we had begun to ascend. Repeated wadings had at all events the advantage of removing all traces of our passage across the swamp. The scenery was highly picturesque, especially at some of the reaches of the little river. The pebbly banks were crowned with a rich vegetation; the number and variety of the trees and shrubs—amongst which the wild plantain, palms of various kinds, and the pandanus were conspicuous—were at least as great as in most tropical lands. Glimpses of lofty wooded heights were frequently obtained. A few tuncful birds were heard, and we saw some azure-hued kingfishers. But, as a rule, particularly as the lower country was left, the music of the woods was monopolised by screeching white cockatoos. The scene was greatly enlivened by the number and beauty of the butterflies which flitted amongst the bushes. One of our party had provided himself with a net; and, though occasional bad shots at some peculiarly nimble *lepidoptera* were made, his 'bag' turned out a very good one. On a broad stretch of gravel and pebbles by the side of the water, towards one o'clock, a halt was made for luncheon. The spot was fairly shady, and the heat, considering our position, was not excessive. A biscuit or two was handed to the carriers, and—what delighted them still more—a few small fragments of tobacco. The New Guinea fashion of smoking is peculiar. The pipe is a bamboo tube about two feet long and two inches in diameter, with one end closed. Near this end, a small hole like the mouth-hole of a flute is made, and in it a piece of leaf, twisted into a pointed cup or 'horn' containing a little tobacco, is inserted. Applying a light to the tobacco, the smoker sucks vigorously at the open end of the tube; when this is filled with smoke, he puts his lips to the small hole and takes several 'draws,' after which the tobacco has to be replenished and the pipe relighted. Politeness flourishes throughout the south-western Pacific Isles; even the naked cannibals of New Britain exhibit to friends that true courtesy which consists in doing as one would be done by. The New Guinean who lights the pipe, when he has filled it with smoke, usually hands it to some one else to have the first whiff. On the present occasion, the pipe was offered first to the white man, to whom, so long as he behaves to them becomingly, Pacific Island natives are almost invariably polite.

The lateness of our start rendered any but a short halt impossible, so the repast was a hasty one. The increasing steepness showed that we had begun the ascent in earnest. A path there

certainly was, but, as a rule, it was not easily discerned amid the thick growth of tropical shrubs. As far as the density of the forest would allow us to examine the country to any distance, we appeared to be mounting the ridge of a spur of the main mountain mass. A deep valley lay on either hand, at the bottom of which we could hear the rumbling of a stream. The number of cockatoos increased as we got higher, and some were shot for culinary purposes subsequently. We saw some handsome pigeons, and at least one small flight of the large beaked bird called toucan, though probably it differs from the South American bird to which that name rightly belongs. Ignorance of ornithology made some of us doubt if it were the hornbill or *buceros*, one of which we heard afterwards overhead puffing like a locomotive, on our way down. The profusion of ferns, palms, orchids, and flowering shrubs was striking. The ascent was really a climb, as the hands had to be used nearly as much as the feet. At one or two points, the face of a steep water-worn rock had to be scaled. Frequent short halts became absolutely necessary; and the load of our long and straggling line of white men and carriers usually resumed the work of ascending as the rear reached the point at which the former had rested. When the afternoon had well advanced—the only watch in the company having been broken at a specially stiff bit of climbing, the exact time could not be told—we had reached a comparatively open space, which our guide declared to be the summit. The impossibility of this being so was demonstrated by the appearance of the true summit, of which a temporary break in the clouds usually hiding it, now permitted a glimpse. Our guide thereupon asserted that it was the only summit which he knew; that no native of the country had ever attempted to mount higher; and that, anyhow, no path was to be found farther on. These assertions were probably true. The correctness at least of the last was soon established beyond the chance of doubt; subsequent progress disclosed the fact that the path, which for the last hour had been scarcely visible by the naked eye, ceased altogether.

When the rear of the line came up, these questions were being debated: Should arrangements be made for camping for the night on the spot then occupied? or should a further attempt to reach the summit be made? Lieutenant Fenton and Mr Stirling settled the matter as far as they were concerned by pushing on with the determination of crowning the mountain by themselves, if no one else cared to follow them. 'Tu-ma-té' reviewed the situation in a short and fitting address, which closed with a reminder that not even a native, it was now proved, had ever got to the top. This was enough to prevent any flagging of the enthusiasm necessary to carry the travellers higher. Even the oldest member of the party, who had already begun to doubt the wisdom of joining in such an enterprise by one who had years ago qualified as a member of the 'senior' United Service Club, unhesitatingly gave his vote for a continuance of the ascent and for the conquest of the virgin height.

It had been held that the previous part of the journey had afforded instances of some rather

pretty climbing. It was child's play to what followed. Path there was none; the vegetation became if possible denser; and the only practicable line of advance ran along the edge of a ridge nearly as 'sharp and perilous' as the bridge leading to the Mohammedan Paradise. This ridge was so steep that, thickly clothed as it was with trees, shrubs, and creepers, it was frequently impossible to advance without pulling one's self up by one's hands. In selecting something to lay hold of to effect this, great care had to be exercised. The 'lawyer' palm, which sends out trailing shoots admirably adapted to the purpose of tripping up the unwary, is studded with thorns in the very part where it is most natural for a climber requiring its aid to seize it. In the most difficult places, there flourished an especially exasperating variety of pandanus. This tree has many uses, and in this instance it seemed to have been purposely placed just where it might best help the ascending traveller. The pyramid of stalks or aerial roots, which unite several feet above the surface of the soil to form the trunk, always looked so inviting to those in want of a 'lift,' that no experience was sufficient to prevent repeated recourse to its assistance. Unhappily, each stalk of a diameter convenient for grasping by the hand was studded with sharp prickles, almost invariably hidden by a coating of deliciously soft moss. It was not until the weight of the body was thrown on the hand encircling one of these deceptive stalks, that the situation was fully realised. In the absence of a path, it was of some advantage to keep amongst the rearward members of the party. A few persons in front quickly made a trail, which was not very often lost, particularly when the leaders had had the forethought to break branches off adjacent shrubs, so that the fractures served as guideposts to those following. The great steepness of the sides of the spur on the ridge of which was the line of advance, rendered it most desirable not to stray from the path, as serious injury, if not complete destruction, would in such case have been inevitable. Sometimes a climber dislodged a stone that went crashing amongst the thick growth with which the precipitous sides were covered, downwards for hundreds of feet, till the noise of its fall died away in the distance.

Clouds were collecting about the mountain, and the sun was about to set, when at length the whole party stood upon the summit. There was a comparatively level space, perhaps thirty feet square, thickly overgrown with trees and shrubs. The moist heat on the way up had been great enough to render every one's clothes dripping wet, even had not occasional thick mists drenched our scanty garments. It was so late that no time was to be lost in making arrangements for spending the night on the top of the mountain. Tomahawks were brought into requisition, and several trees were felled and laid one on another along two sides of a small square, thus forming a low wall, under shelter of which a bivouac might be formed. Many showers had fallen on the higher parts of the mountain during the day, and so general was the humidity that it was difficult to light a fire. When this was at length accomplished, a meal was prepared,

and soon despatched. The kindling of a fire incited the native carriers to do the same on every available spot, amongst others at a point dead to windward of the bivouac, to the grievous annoyance of the travellers' eyes, till a more suitable place was substituted.

With leaves and twigs plentifully strewn under the lee of the felled logs, the white men had managed to get themselves 'littered down' for the night. The small rain which had been falling nearly ever since the summit had been reached, turned into sharp showers, and showed symptoms of continuing. The supply of water was found to be very short, as, trusting to the statements of the natives before it was ascertained that their knowledge of the country did not extend beyond the termination of the path, it was thought unnecessary to carry a large supply to the end of the journey, where, it was anticipated, it would be found in abundance. The prospect for the night was not cheering. Those who had brought a change of clothing now put it on in place of the dripping garments hitherto worn, and rolling themselves in their blankets, lay down to sleep, or to try to sleep. Many things conspired to prevent slumber. It was soon discovered that some of the party had no blanket. Mr Chalmers at once set himself to rectify this, and did so in characteristic fashion. He borrowed a knife, and, cutting his own blanket in two, insisted upon its being accepted by a companion who had none. It is related of one of the several Saints Martin—on board men-of-war, we cannot be expected to be very familiar with the hagiology, so it will be well not to attempt to specify which of them it was—that seeing a beggar in want of a cloak, he gave him his own. Now, seriously, without in the least desiring to disparage the charity of the saint, it may be pointed out that beggars are usually met with in the streets of towns, and that to give away a cloak therein is at the best not more meritorious than giving to a companion half of your only blanket at the beginning of a rainy night on the summit of a distant mountain. But this was not all. It was decided that the best protection against rain would be the erection of some sort of tent. 'Ta-ma-té' was soon employed in helping to construct this shelter, and in spite of all opposition, persisted in contributing the remaining portion of his blanket to form the roof.

Contenting himself with as much of a companion's blanket as could be spared to him, he made himself, as he protested, extremely comfortable; and that all might be as merry as possible, started a musical entertainment by favouring the company with *Auld Langsyne*. His jollity was contagious. There was a succession of songs. When these had been concluded with a 'fore-bitter' of formidable length on the death of Lord Nelson by a seaman of H.M.S. *Nelson* gifted with a fine voice, the natives were invited to take up the singing. They complied without much hesitation. They sang in a low and rather plaintive tone, with a curious deep tremolo uttered from time to time in unison. At length, as some began to grow sleepy, Mr Chalmers asked for silence, so that the teacher Biga might be able to conduct the evening devotion. This he did in an extempore prayer, attentively

followed by the natives, and, if not understood, at all events reverently listened to, by the white men. To one at least of the latter, sleep was impossible. Fatigue must be indeed overwhelming which will enable one to slumber when, in the midst of the only available sleeping-place, a point of rock is so situated that it almost forces a passage between the ribs. Luckily, there were no mosquitoes or other voracious insects. But there was an unpleasant many-legged black slug four or five inches long which evinced an unconquerable predilection for crawling over the naked human body. It was far from pleasant to find this animal just effecting a passage between the neckband of the shirt and the skin, or trying to coil itself round the ear of the side which happened to be uppermost. A careful member of our party, before lying down, had stretched a line between two trees, and on it had hung his wet clothes. Looking about him in the night, he discovered that the clothes had disappeared, and his announcement of this discovery elicited from a companion the intelligence that the natives were wearing them. This statement, so to speak, brought down the house. The natives heartily joined in the hilarious applause with which it was received. The same reception was extended to occasional ejaculations from other companions of the bivouac, such as, 'By Jove! there's a native with my shirt on!' Subsequent reflections convinced the owners that it was fortunate that the temporary borrowing of their clothes by their native friends had been looked upon as part of the fun of the excursion. Had any one been so ill-conditioned as to maltreat or scold the merry, intelligent carriers, they would, almost to a certainty, have stolen away in the night, and have left the white men to get the natives and their things home as best they could. One native gentleman displayed so much ingenuity in the mode of wearing one of the more unmentionable garments, which he somehow or other succeeded in converting into a kind of sleeved waistcoat, that the appreciative owner made him a present of it. The new possessor had a proper pride in this acquisition; and wore it in his village after the descent; indeed, he had the honour of being introduced to the commodore whilst clad in it.

'Ta-ma-té,' who, with universal assent, had established a genial despotism over the bivouac, issued a decree that every one should make a joke, and that the joke adjudged the best should be sent to a newspaper for publication. Either this was trying the loyalty of his contented subjects too severely, or the labour of incubating jokes was too great for wearied mountaineers, for, after one or two feeble endeavours to comply with his edict, a general silence fell upon the company.

In the morning, after a not absolutely perfect night's rest, deficiency of water rendered abstaining from even an attempt at breakfast compulsory. There was little, therefore, to delay the ceremony of hoisting the union-jack—providently brought for the purpose by Lieutenant Fenton—upon the newly crowned summit. A suitable tree was cut down and lopped; the flag was secured to it; and a hole having been dug in which to insert it, the flagstaff was reared amidst a very good imitation of three cheers from the natives,

and the real thing from the white men. The descent then began; and much of it was effected by a different route from that of the ascent. Orchids, ferns, and other plants were collected on the way. Sore hands, barked shins, added to want of sleep and to a long fast, made the descent seem to some even more fatiguing than the climb of the day before. The interval before water was reached appeared excessive, and before a halt could be made for breakfast, interminable. By two p.m. the travellers were back on board their ships, proud of the distinction of being the first to ascend a mountain summit in Eastern New Guinea.

TREASURE TROVE.

A STORY IN FOUR CHAPTERS.—CHAP. IV.

UPON Jasper Rodley's entrance into the house, Bertha had retired to her own room, pleading that she was suffering from the excitement, the fatigue, and the exposure she had undergone; but she could hear a conversation kept up in the dining-room until a late hour, and instinctively felt that Rodley had not come again without a reason. To her surprise, the next morning she found that both her father and his visitor were already downstairs, Jasper Rodley looking out of the window and whistling to himself, the captain with evident agitation marked on his movements and face.

'Bertha,' he said, without even giving her the usual morning greeting, 'Mr Rodley has come here especially to say that from information he has received, it will be necessary for you at once to decide what course you intend to adopt. There is a chance, he says, that the great evil hanging over our heads may be averted, but it depends upon your answer.'

'Mr Rodley must give me until this evening to think over the matter. I am going into Saint Quinians, if possible to see Harry—that is, Mr Symonds, for even Mr Rodley will admit that plighted troths are not to be broken in this abrupt manner. I shall be home before dark.'

'Then I will see you on your road,' said Rodley, 'as I am going into the town.'

'You need not trouble,' said Bertha. 'The road is quite familiar to me, and I have no fear of being molested.' Then, without waiting to hear whether Jasper Rodley objected or not to the arrangement, she left the house.

In exactly an hour's time, she walked into the town. At the old gate she was confronted by rather a pretty girl, who laid a hand gently on her arm, and said: 'You are Miss West, I believe?'

Bertha replied in the affirmative.

'You are in an unhappy and terrible position, and you have very little time to spare, I think,' added the girl.

Bertha looked at her wonderingly, for she could not recall ever having seen her before.

'I mean,' explained the girl, who observed that Bertha was surprised at this acquaintance on the part of a stranger with her affairs, 'I mean with regard to that man, Jasper Rodley.—Yes, I know all about it; and I want, not only to be your friend, but to see that evil-doing meets with its just reward.'

The girl was poorly dressed; but her accent and mode of expression were those of an educated woman, and, moreover, she had such a thin, sorrow-lined face, that Bertha felt she could trust her.

'Let me be with you to-day,' continued the girl, 'and you may thank me for it some day. I have long wanted to see you, and have waited here for you often. Never mind who I am—that you shall find out later.'

'Very well,' said Bertha, who naturally clung to the friendship of one of her own sex. 'I am going to see Mr Symonds—my betrothed.'

'The gentleman who was obliged to leave Faraday's Bank, four years ago; yes, I remember,' said the girl.

They crossed the market-place together, and were soon at Harry Symonds' lodgings. The servant, in reply to Bertha's inquiries, said that the young man was so far recovered as to be able to sit up, but that the doctor had ordered him to keep perfectly quiet and to be free from all excitement. So Bertha wrote him a note describing all that had taken place, and begging for an immediate answer. In the course of twenty minutes, the servant handed her a piece of paper, on which was scrawled as follows:

MY DEAREST LOVE—This is written with my left hand, as my right is yet in a sling. I wish I could say all that I want to; but as every moment is of value to you, I will simply keep to business. Take a postchaise home; get the money out of the cavern, and send it here. John Sargent the fisherman is to be trusted; let him come back with it in the postchaise. I will return it to the bank, making up out of my savings whatever difference there is from the original amount stolen. Lose no time, my darling, and God bless you!—Ever your affectionate

HARRY.

Bertha and the girl hurried away; and just as they entered the *Dolphin Inn* to order the chaise, they espied Jasper Rodley entering the town watchhouse, the local headquarters of the civil force which in those days performed, or rather was supposed to perform, the duties of our modern constabulary.

'Miss West,' said the girl, 'I had better remain in the town for the present. At what hour to-day is Jasper Rodley coming to your house?'

'I said I would be home by dark. He will be there before then, to receive my final answer.'

'Very well, then; I will be there about that time,' continued the girl.

'Will you not even tell me your name?' asked Bertha.

'Yes. My name is Patience Crowell. Till to-night, good-bye. Keep up your spirits; all will end well.'

In a few minutes the postchaise was ready, and in order to escape the notice of Jasper Rodley, was driven round to the town gate, where Bertha jumped in. She stopped at John Sargent's cottage, and mentioned her errand.

'Why,' said the old fisherman, 'I'm too glad to do anythin' for Master Symonds. He saved my life once at Saint Quinians' jetty, and I've never had no chance of doin' aughtin' for him

in return like.—Come along, miss; if it's to the end of the world, come along!'

As Jasper Rodley might pass by at any moment, Bertha thought it best to keep the chaise out of sight, whilst she and the fisherman, provided with a large net-basket, proceeded to the cliffs. In half an hour's time the bags of coin were safely stowed away in the postchaise; John Sargent jumped in, the chaise rattled off; and Bertha, with a light heart and a heightened colour, returned home.

The captain was stamping up and down the little gravelled space in his garden, which from the presence there of half-a-dozen old cannon and a flagstaff, he delighted to call the Battery. When he beheld Bertha, he welcomed her with a sad smile, and putting her arm in his, said: 'Bertha, lass, I've been thinking over this business ever since you went away this morning, and the more I've thought about it, the more I've called myself a mean, cowardly, selfish old fool.'

'Why, father?'

'Because, look here. I've been telling you to make yourself miserable for life by marrying a man you despise and dislike, just so that I may get off the punishment that's due to me. I'm an old man, and in the ordinary course of things, I can't have many years before me. You're a girl with all your life before you, and yet I'm wicked enough to tell you to give up all your young life so that my few years shouldn't be disturbed.'

'But father'—began Bertha.

'Let me speak!' interposed the old man. 'I've been doing a wicked thing all these four years; but I know what's right. When this man asks you to be his wife to-night, you say "No"; my mind, you say "No." If you don't, I will; and you won't marry without my permission.'

'Dear father, you leave it to me. I do not promise anything except that by no act of mine shall one hair of your head be touched.—Let us talk of other things, for Jasper Rodley will be here soon.'

So they walked up and down until the sun began to sink behind the hills inland and the air grew chilly. They had scarcely got into the house, when Jasper Rodley appeared. He bowed formally to Bertha, and offered his hand to the captain, which was declined. 'Miss West,' he said, 'I think I have given you fair time for decision. I have not been so exacting as circumstances justified.'

Bertha said nothing in reply, but sat in a chair by the window, and looked out on the sea as if nothing unusual was taking place.

So Jasper Rodley continued: 'I will speak then at once, and to the point. Miss West, will you accept me for your husband?'

'No, I will not,' replied Bertha, in a low, firm voice.

Mr Rodley was evidently unprepared for this, and looked at her with open mouth. 'That is your final answer?' he asked, after a pause. 'You are prepared to see your father, whom you love so dearly, taken from here in custody to be brought up as a common felon?'

'Yes. That is, Mr Rodley, if you can prove anything against him. Of what do you accuse him?'

'I accuse him of having lived during the past four years upon money which was not his, but which was stolen from Faraday's Bank in Saint Quinians, which was taken off in a vessel called the *Fancy Lass*, the said vessel being wrecked off this coast.'

'Very well,' continued Bertha. 'What is your proof that he knows anything about this money?'

'One moment before I answer that. You refuse to marry me if I can bring no proof. You will marry me if I do?'

'Show me the proof first,' answered Bertha.

'You must follow me, then.'

'Not alone.—Father, you must come with me.'

So the trio proceeded out into the dusk, and, conducted by Jasper Rodley, followed the path leading to the cliffs. Bertha observed that they were followed at a little distance by a man closely enveloped in a long coat, and as they ascended the ledge of rock communicating with the shore, noticed two other figures—those of a man and a woman—watching them.

'It's a very nice little hiding-place,' remarked Rodley, when they arrived at the bushes—'a very nice little hiding-place, and it seems almost a pity to make it public property; but a proof is demanded, and sentimental feelings must give way.' He smiled as he said this, and kicked the bush aside with his feet, thus uncovering the cavern entrance. They entered the hole, which was now quite dark; but Rodley had come prepared, and struck a light. He then rolled away the stone, and without looking himself, gave Bertha the light and bade her satisfy her doubts.

'There is nothing here,' she said.

'Nothing!' exclaimed Rodley, taking the light from her hand and examining the cavity. 'Why!—Gracious powers! no more there is! There has been robbery! Some one has been here and has sacked the bank!' His face was positively ghastly in the weird light as he said this, and under his breath he continued a fire of horrible execrations.

'Well, Mr Rodley,' said Bertha, smiling, 'and the proof?'

Rodley did not answer, but moved as if to leave the cavern, when a woman's figure confronted him at the entrance, and a ringing voice said: 'Proof! No! He has no proof!'

Rodley staggered back with a cry of rage and surprise. 'Patience! Why—how have you got here? I left you at Yarmouth!—Ha! I see it all now!'

'Yes,' cried the girl, 'of course you do. I gave you fair warning, when I found out that you were beginning to forsake me for another; but not until after I had begged and entreated you, with tears in my eyes, to remember the solemn protestations of love you had made me, and the solemn troth which we had plighted together.'

'Let me go!' roared Rodley; 'you're mad!'

'No, no—not so fast!' cried the girl. She made a signal to some one without, and a man entered.

'Jasper Rodley,' continued Patience, 'this constable has a warrant for your apprehension on the charge of having been concerned in the bank robbery four years ago—Yes, you may look fiercely at me. I swore that the secret in my

keeping should never be divulged. I loved you so much, that I was ready even to marry a thief. But as you have broken your faith with me, I consider myself free of all obligations.—Captain West, it was this man who planned the robbery, who had the coin conveyed to his boat, the *Fancy Lass*, and who alone was saved from the wreck.'

Rodley made a desperate rush for the cave entrance; but the constable held him fast, and took him off.

'There, Miss West!' cried the girl; 'I have done my duty, and I have satisfied my revenge. My mission is accomplished. Good-bye, and all happiness be with you.' And before Bertha could stop her, she had disappeared.

Jasper Rodley was convicted on the charge of robbery, and received a heavy sentence, which he did not live to fulfil. Harry Symonds paid in to the bank the entire sum stolen, the authorities of which offered him immediately the position of manager, which he declined. He and Bertha were married shortly afterwards; but they could not induce the old captain to move to the house they had taken, for he could not get over the shame of the exposure, and declared that he was only fit for the hermit life he had chosen; but no one outside the little circle ever knew that he had been indirectly concerned in the robbery; and neither Harry nor Bertha alluded to it after.

Of Patience Crowell, who had so opportunely appeared on the scene, nothing was ever known.

THE MONTH:

SCIENCE AND ARTS.

DR GUSTAV JAEGER, whose sanitary clothing reform made some little stir a year or two back, seeks to apply the principle involved in his theory to furniture. This theory teaches that cotton, linen, and other stuffs of vegetable origin retain a power of absorbing those noxious animal exhalations which as plants they digest. Dead fibre, or wood, will, he maintains, act in the same manner, and will throw off the deleterious matter, to the prejudice of living beings, whenever there is a change of temperature. This, he holds, is the reason why a room which has been shut up for some days has an unpleasant odour attaching to it, and which is very apparent in German government offices, which are fitted with innumerable shelves and pigeon-holes made of plain unpainted wood. For sanitary reasons, therefore, the back and unseen parts of furniture should be varnished, painted, or treated with some kind of composition, to fill the pores of the wood; hence it is that so-called sanitary furniture has in Germany become an article of commerce, and is likely to find its way to this and other countries.

Such large quantities of ice are now made by various artificial processes, that ice is no longer a luxury which can only be procured by the rich, but is an article of commerce which can be purchased at a very low price in all large towns in the kingdom. It is not generally known that the artificial product is far purer than natural ice, but such, according to M. Bischoff of Berlin,

who has made a scientific analysis of specimens, is the cause.

All honest persons rejoice greatly when a notorious evil-doer is run to earth, and much the same satisfaction is experienced when science points with unerring finger to the source of disease, for then the first step has been taken in its eradication. Many, therefore, will rejoice when they read the recently issued Report of Mr W. H. Power, the Inspector of the Local Government Board, concerning an epidemic of scarlatina which occurred in London last year. The story is most interesting, but too long to quote in full. Suffice it to say that the disease in question has, after the most painstaking inquiries, been traced to the milk given by certain cows which were affected with a skin disease showing itself in the region of the teats and udders. We know to our cost that certain diseases can be transferred from the lower animals to man. 'Woolsorters' disease' is traced to the same germ which produces splenic fever in cattle and sheep, a malady which has been so ably dealt with by M. Pasteur. The terrible glanders in horses is transferable to man. Jenner was led to the splendid discovery of vaccination from observing the effects of cowpox on milkmaids; and now we have scarlatina traced directly to the cowhouse. Dr Klein, the famous pathologist, has been engaged to report upon this new revelation concerning milk, and we may reasonably hope that his researches will bear fruitful results.

A new method of etching on glass has been devised. The ink is of a waxy composition, and requires to be heated to render it fluid. It is applied to the glass with a special form of pen, which can be kept in a hot condition by a gas or electrical attachment. When the drawing is complete, the plate is etched by fluorid acid, which of course only attacks and dissolves those portions not covered by the protective ink. The result is a drawing in raised lines, which can be made to furnish an electrotype, or can, if required, be used direct as a block to print from.

Springs in mid-ocean are not unknown, and, if we remember rightly, there is more than one of the kind at which ships have endeavoured to renew their stores of fresh water. But an ocean oil-well is certainly a rarity. The captain of a British schooner reports that in March last, while bound for New Orleans, his vessel passed over a submarine spring of petroleum, which bubbled up all round the ship, and extended over the surface of the sea for some hundred yards. It seems to be a moot-point whether this phenomenon is a mere freak of nature, or whether it is caused by the sunken cargo of some ill-fated oil-ship. In the latter case, the gradual leakage of casks would account for the strange appearance.

Inventors of gas apparatus should note that the municipal authorities of Brussels have decided upon holding a competition, with a view to ascertain the best means of using gas for heating and cooking purposes. A large sum is to be offered in prizes to the successful competitors. Apparatus for trial must be forwarded not later than September next, and all particulars regarding the matter may be obtained from the chief engineer, M. Wybauw, Rue de l'Étuy, Brussels.

In the island of Skye, large deposits of the very useful mineral called diatomite have recently been found. Under the German name of *Kieselguhr*, this absorbent earth has been extensively used in the manufacture of dynamite, which consists of nitro-glycerine rendered more safe for handling by admixture with this porous body. It is also used as a non-conducting compound for coating the exterior of steam-pipes and boilers, as a siliceous glaze for pottery, for the manufacture of silicate paints, and for many minor purposes. In this particular deposit the varieties of diatoms are singularly few, only sixteen species of these wonderful microscopic organisms being represented. The deposit is estimated to yield a total of between one and two hundred tons.

At a recent meeting of the Royal Society of Edinburgh, Dr A. B. Griffiths read a most instructive paper on 'The Effect of Ferrous Sulphate in destroying the Spores of Parasitic Fungi.' The value of this salt—the common 'green vitriol' of commerce—as a plant-food has long ago been established; but Dr Griffiths points out the important antiseptic property it possesses in destroying certain low forms of plant-life. As a preventive of potato disease, it is most effectual, although the spores of that fungus possess such vitality that they may be kept as dry dust for eight months without losing their power for mischief. Dr Griffiths also notes that in damp warm weather, the potato disease is actually encouraged by the use of potash manures. He advocates the treatment of manure with a weak solution of the iron salt before its application to the land. Wheat when treated with the sulphate is rendered proof against mildew.

A clever method of dainascencing metals by electrolysis is described in a French technical journal. The process consists of two distinct operations, and is based on the well-known fact, that when two copper plates are hung in a bath of sulphate of copper and connected with the opposite poles of a battery, a transfer of metal from one to the other will take place. In the case before us, a copper plate is covered with a thin layer of insulating material, as in the etching process, and this is drawn upon with an etching needle so as to lay bare the metal beneath. This is now submitted to the action of the electric current, so that the metal is eaten away to a certain depth in the exposed parts. The plate is next washed with acid, to remove all traces of oxide of copper in the bitten-in lines, and is then transferred to another bath by which metallic silver or nickel is deposited in the etched parts, with the result that the sunk lines are ultimately completely filled with the new metal. When the plate is relieved of its waxy coating and is polished, it is impossible to say whether or not the beautiful inlaid appearance has been produced by a mechanical process or by skilled handwork.

Two remarkable finds of old coins have lately occurred—one at Milverton, a suburb of Leamington; and the other at Aberdeen. In the first case, some labourers were digging foundations, when they found a Roman amphora, which they immediately smashed to ascertain its contents. It contained nearly three hundred coins in silver and copper. These were of very early date, and

in a state of excellent preservation. The Aberdeen treasure trove came to light in excavating Ross's Court, one of the oldest parts of the city. Here the labourers found a bronze urn filled with a large number of silver coins. These coins also are well preserved. They are all English, and are mostly of the reigns of Edward I. and Edward II. Some of these coins are of extreme rarity, and the discovery has great antiquarian interest.

The largest installation of the electric light, worked from a central point, which this country has yet seen has been recently completed at the Paddington terminus of the Great Western Railway. The lights, which are equivalent to thirty thousand ordinary gas jets, are distributed between the Paddington passenger and goods stations, the 'Royal Oak,' and Westbourne Park Stations, the terminus hotel, and all the various offices, yards, and approaches to the railway Company's premises. The district covers no fewer than sixty-seven acres of ground, and is one mile and a half long. The two Gordon dynamos which are used to generate the current weigh forty-five tons each, and give sufficient power to serve four thousand one hundred and fifteen Swan glow lamps, each of twenty-five candle-power; ninety-eight arc lamps, each of three thousand five hundred candle-power; and two of twelve thousand candle-power each. The current is kept on day and night, except for a few hours on Sunday morning, and each individual lamp is under separate control by a switch, so that it can be turned off and on just like a gas jet. Every detail has been well thought out, and the vast scheme is a success in every way. We understand that the contractors, the Telegraph Maintenance and Construction Company, have undertaken to supply the light at the same price as would have been charged for gas lamps giving the same light-value.

From a paper read by Mr C. Harding before the Royal Meteorological Society on 'The Severe Weather of the Past Winter,' we learn that the cold lately experienced has been of the most exceptional character. The persistency with which frost continued for long periods was quite remarkable. In south-west England, there was not a single week from October to the end of March in which the temperature did not fall below the freezing point; and in one town in Hertfordshire, frost occurred on the grass on seventy-three consecutive nights. Since the formation of the London Skating Club, nearly sixty years ago, the past season has been the only one in which skating has been possible in each of the four months December to March. We therefore must note that we have just passed through an unusually severe season.

Fresh fruit from the antipodes, of which two large consignments have recently reached London, is now being daily sold to eager purchasers in the Australian fruit-market at the Indian and Colonial Exhibition. Grapes, apples, pears, and other fruits, in splendid condition, and with their flavour unaltered by their long separation from their parent stems, can now be conveyed by the shipload, packed in cool chambers, in the same way that meat is imported from the same distant lands. The success of the enterprise opens up a wide field of promise to those in temperate lands who have been dazzled by the reports of travellers as to the luscious nature of foreign fruits, which

hitherto have been quite out of reach of stay-at-home Britons. We seem to be fast coming to the time when fairy tales will be considered tame and uninteresting, from being so far eclipsed by current events.

A correspondent of the *Times* notes a most important means of escape from suffocation by smoke, a fatality by which many lives are lost annually. He points out that if a handkerchief be placed beneath the pillow on retiring to rest so as to be within easy reach of the hand, it can, in case of an alarm of fire, be readily dipped in water and tied over the mouth and nostrils. As an amateur fireman, he has gone through the densest smoke protected in that manner, and he alleges that such a respirator will enable its wearer to breathe freely in an otherwise irrespirable atmosphere.

Professor Dewar lately exhibited at the Royal Institution, London, the apparatus he employs for the production of solid oxygen. If we refer to the physical text-books of only three or four years back, we find oxygen, hydrogen, and nitrogen described as permanent gases, for no one had ever produced either in any other form. At length all three had to give way before scientific research, and they were by special appliances reduced to the liquid state. Professor Dewar is the first experimenter who has taken the further step of producing one of these gases in a solid form. His method consists in allowing liquid oxygen to expand into a partial vacuum, when the great absorption of heat which accompanies the operation causes the liquid to assume a solid state. It is said to resemble snow in appearance, with a temperature greatly below the freezing-point of water. It is believed that a means of producing such a degree of cold will be of great service to experimental chemistry.

Mr W. Thomson, F.R.S.E., has devised a new process for determining the calorific power of fuel by direct combustion in oxygen, which promises to supersede, by reason of its greater accuracy, the methods hitherto in use. The process consists in placing a gramme of the coal or fuel to be tested in a platinum crucible covered with an inverted glass vessel. The whole arrangement is placed under water in a suitable receptacle; and the fuel, burnt in oxygen, burns away in a very few minutes, giving off much heated gas, which escapes through the water. The temperature of the water, compared with its temperature before the operation, gives the data upon which the heating power of the coal can be calculated. The question of heat-value in fuel is of course one of first importance to railway Companies and other large consumers of coal. It is, too, in a minor way of importance to householders, who often find, by painful experience, the little heat-value of the fuel which has been shot into their cellars. If coal-merchants were to furnish some guarantee based on a scientific test as above described, they would find it to their own profit, as well as to the advantage of their customers.

We do not hear very much in these days of mummy wheat and barley, but many people firmly believe that the seeds of both plants found with Egyptian mummies, and supposed to be three or four thousand years old, will sprout if

put in the ground. A few years ago, such wheat was commonly sold as a curiosity; and we believe that many purchasers succeeded in raising a small crop from it. Professor Bentley, who has recently commenced a series of lectures on the Physiology of Plants, asserts most emphatically that no grains which with certainty have been identified as contemporaneous with the deposit of the mummified corpse, have ever come to life. In cases where the so-called mummy wheat has germinated, it has been introduced into the coffin shortly before, or at the time of discovery of the body. Professor Bentley does not name a limit to the time during which seeds retain their vitality, but he says that very few will germinate after being three years old.

Dr Kosmann of Breslau has designed a safety cartridge for use in fiery mines, but it has not yet passed the ordeal of practical employment. It depends for its efficiency upon the sudden evolution of a large volume of hydrogen gas, which is brought about by the action of dilute acid upon finely divided zinc. The 'cartridge' consists of a glass cylinder pinched into a narrow tube at the centre, so that interiorly it is divided into two compartments. One of these contains the powdered zinc, and the other the dilute acid, the passage between them being closed by a rubber cork. The borehole into which it is inserted is first of all made gas-tight by a lining of clay; then the cartridge is put in position, with an iron rod in connection with it so placed that, when struck with a hammer from the outside of the hole, it will drive in the rubber cork, and so bring the acid into contact with the zinc. We shall be interested to hear how the method answers in practice.

JACK, THE BUSHRANGER.

AN AUSTRALIAN REMINISCENCE.

READING in your *Journal* (writes a correspondent) an article headed, 'A Bushranger Interviewed,' recalls to my memory a strange incident which occurred some years ago to my own brother, when on his way from Sydney to the gold-fields, and for the accuracy of which I can vouch.

At the time of his arrival in Australia, the country was in a state of panic; a reign of terror existed, caused by the daring outrages committed on parties on the journey to and from the diggings. Robbery with violence, escorts shot down, and large consignments of gold carried off, were of daily occurrence. The bush was infested by a gang of desperate bushrangers, whose leader, under the cognomen of 'Jack,' seemed to bear a charmed life. For years he had evaded all the efforts made to capture him, though the military scoured the bush. No sooner was an outrage perpetrated, than all trace of the perpetrators was lost, as if the ground had swallowed them. He had a perfect knowledge of the most secret movements of the parties he attacked. He seemed ubiquitous, outrages occurring in such rapid succession and far apart. Such an air of mystery hung about him, that a superstitious feeling mingled with the moral terror he inspired. He was represented by some persons who had seen him, as

a fine powerful-looking man, with nothing forbidding in his appearance.

Even the mad thirst for gold could not induce the bravest persons to undertake the journey alone. The gold-seekers travelled in large cavalades, well armed, and determined to fight for their lives and property; one of these parties my brother joined. He was a fine handsome young fellow, all fun and love of adventure, and he soon became a general favourite. The 'track'—for there were no roads at that time—ran for the greater distance through the bush, some parts of which were so dense as scarcely to admit daylight. Every man was well armed. My brother had brought with him a first-class revolver, purchased in London. This he kept with other valuables carefully hidden on his person, his other belongings being stowed away in one of the wagons. When they bivouacked for the night, care was taken that it should be in an open space, where a good look-out could be kept, to make sure against a sudden surprise. The wagons were placed in the middle, sentries posted, and scouts placed so that the flight of a bird or the fall of a leaf could not pass unnoticed. All were on the *qui vive*. For some days all went well, nothing unusual or alarming occurring. They were then well into the bush, and consequently, if possible more vigilant, believing that even a mouse could not intrude itself amongst them.

One morning it was found that, during the night, they had been, spite of all their vigilance, mysteriously and unaccountably joined by a stranger, who stood in their midst as if one of themselves. No one could imagine how or whence he came, and utter astonishment prevailed. He was a fine portly man, from thirty-five to forty years of age, with an open, prepossessing countenance and a good address—one who, under other circumstances, would have been looked upon as an acquisition to the party. Not in the least taken aback or abashed by the scant welcome he received or the undisguised surprise his presence created, he came forward boldly, and told a most plausible story, to the effect that he was a stranger making his way to the gold-fields, that, notwithstanding the stories he had heard in Sydney of 'Jack' and his comrades, he had ventured so far alone; but as he got farther into the bush he lost heart, and determined to join the first party he met.

It looked strange that he had no luggage of any kind, not even provisions, or anything to indicate that he was bound for a long journey. He made no attempt to account for his mysterious appearance, entered into the arrangements of the cavalcade, and made himself quite at home. Every man amongst them, with the exception of my brother, believed that no one but 'Jack' himself could have so taken them by surprise, the general belief being, that it could only be from personal experience the terrible bushranger derived the perfect knowledge he displayed when making his raids.

The party agreed that the wisest course would be to await the progress of events, watch his every movement, and let him see that they were prepared to sell their lives dearly, if driven to do so.

The stranger seemed to have an unlimited

supply of money, and to be generous about it, paying his way freely. He took at once to my brother, and the liking was mutual; in diggers' parlance, they became mates, chummed, walked, and smoked together. My brother found him a well-informed, agreeable companion, a vast improvement on their rough associates; and he seemed thoroughly to enjoy the society of the jovial young Irish gentleman. A sincere friendship sprung up between them, notwithstanding the disparity in years.

The other members of the party became very anxious, fearing the man would take advantage of my brother's unsuspicious, trusting nature to obtain information that would be useful to him when forming his plans for the attack which was hourly expected, in fact looked upon as imminent. Nor were their fears allayed when, after a little, he would leave the beaten track and walk into the bush, remaining away for hours, and returning at the most unexpected times and places; showing a thorough knowledge of the bush and all its intricacies and short-cuts, quite inconsistent with the story he had told on joining.

One thing struck my brother as strange, but without exciting any suspicion on his part. When walking together, he would suddenly stand, become quite excited, and say: 'Oh, it was here such an outrage occurred.' 'It was on the spot on which we are standing that the escort was shot down and a large consignment of gold carried off. They did fight like demons.' He seemed to take the greatest pleasure in giving minute details of the different outrages as they had occurred, and always spoke as if he had been an eye-witness. But so thorough was my brother's belief in his new friend, that even this did not shake his faith.

When a few days of the journey's end, the stranger suddenly and quite unexpectedly declared his intention of parting company. He offered no explanation as to his reason for doing so, though all through he had seemed anxious to impress it on them that he intended to go the entire way to the diggings with them. No questions were asked.

After a general and hearty leave-taking, which, however, did not inspire much confidence, as they were still within range of a possible attack, he asked my brother to take a last walk with him, and led the way into the bush farther than he had ever brought him before, and a long distance from the beaten track. The first words the stranger said were: 'Mate, don't you carry a revolver?'

The answer was: 'Yes, and a first-class one. Not such as is got out here. I brought it from home.'

'Show it to me,' said the stranger; 'I love a real good weapon;' and without the slightest hesitation, my brother handed him the revolver, which he examined carefully, and saw that the chambers were loaded. He remarked that it was the 'prettiest weapon' he had handled for a long time.

He walked a few steps in advance, and turning round suddenly, he presented the revolver at my brother's head, calling out in a commanding tone, 'Stand!' his countenance so changed as scarcely to be recognised.

At last my brother felt that he stood face to face with the terrible bushranger, but did not lose his presence of mind.

For a moment there was a profound silence, first broken by the stranger saying: 'Is there anything on earth to prevent my blowing out your brains with your own weapon, placed in my hands of your own free-will? The wild bush round us, I know its every twist and turn. The man is not living who could track my foot-steps through its depths, where I alone am lord and master. Speak, man! What is there to prevent me?'

With a throbbing heart and a quickened pulse my brother answered: 'Nothing but your sense of honour.'

The man's face brightened, and his voice resumed its friendly tone, and handing back the revolver, he said: 'We stand now on equal footing. You hold my life in your hands, as I held yours a moment ago. Yes, boy; and your own fortune too. But I trust you, as you trusted me. I would not hurt a hair of your head, and I have spared others for your sake. How, you will never know; but they owe you a deep debt of gratitude. You are a noble-hearted fellow; and through the rest of my stormy life, I will look back with pleasure on the time we have passed together. But, mate, you are the greatest fool I ever met. I brought you here to-day to give you a lesson, which I hope you will bear in mind. You are going amongst a rough, lawless crew; never, as long as you live, trust any man as you have trusted me to-day. Where you are bound for, your revolver will be your only true friend; never let it out of your own keeping, to friend or foe. You are far too trusting. There was not a man but yourself amongst those from whom I have just parted who did not believe from the moment I joined that I was Jack the bushranger. Well, mate, I am not going to tell you who or what I am, or how or why I came amongst you; but of this rest assured, that you have no truer friend. You will never know what I have done for your sake.—Now, mate, good-bye for ever. We will never meet again in this world, and it is best for you it should be so.' Then leading him back to the track by which he could rejoin his party, he wrung my brother's hand, turned and walked quickly into the bush, leaving no doubt upon my brother's mind that the friend he had so loved and trusted was indeed the dreaded bushranger.

They never did meet again. My brother came home to die; and unless my memory deceives me, Jack was shot dead in a skirmish with the military.

THE BIRDS AT SOUTH KENSINGTON.

SOUTH KENSINGTON has of late years been so inseparably identified with Art, that it will seem natural to the readers of this article for Art to form its subject; but it will probably surprise the frequenters of these buildings to be asked to bend their steps towards the Natural History Department—which one naturally supposes devoted to scientific objects—to examine works of art quite equal in their way to any to be

found in the building devoted ostensibly to that purpose.

Many must have been struck by the artistic and natural grouping of the birds, with their nests and young, in imitation of the surroundings they frequent while living. How much more one is impressed with the beauty of the creatures, when one sees them arranged in the positions they assume in a state of nature, than when placed in the old-fashioned style, mounted on boards or badly imitated stumps of trees! Justly, this admirable grouping calls forth exclamations of delight from the beholder; yet there is a fact connected with this artistic grouping that is as well worthy of the admiration of the visitor as the scientific facts here intended to be represented.

The surrounding of each of these nests is a work of art in itself, constructed, with the most painstaking regard to accuracy of detail, by a lady, whose name, though not appearing in this connection, is not unknown to fame. The sods—if the bird be a ground-builder—are dug up with the nest and surroundings as they are found, and are submitted at once for the modeller to copy the various weeds and flowers exactly as they grow. The sods are then dried and cleaned, and the modeller fixes into them the flowers and weeds she has constructed, and paints up the grass, to restore it to its original colour. They are then deposited in the places they are destined to occupy in the Museum.

The material employed for making these artificial flowers and weeds has been called by the inventor, who is also the modeller, the 'New Kensington Art Material.' Boughs of trees, the minutest flowers and weeds, even the hair-like filaments that many flower-stems possess as a protection against the ravages of insects, are copied with such scrupulous accuracy as to defy detection by ordinary means; and the union between the real wood and its artificial representation is concealed with the same regard to reality. The secret of the manufacture of the material is strictly preserved.

At the International Exhibition of 1851, Mrs Mogridge—then Miss Mintorn—in conjunction with others of her family, took the first prize for models of wax-flowers; notably a model of 'Victoria Regia' lilies, taken from the first to bloom in England, by permission of Her Grace the Duchess of Northumberland. Of late years, Mrs Mogridge has used the new Art Material in place of wax, on account of its superior strength, and indestructibility, it being unaffected by heat, the great enemy to all work in wax. Moreover, it admits of more perfect colouring; no shade being unattainable in this composition, and permitting of the most brilliant effects of pigmentation.

It is adaptable to all artistic decorations on account of its greater strength; and flowers made in it can be mixed with living foliage so as to be a perfect deception, when the real flowers are unattainable. It may be interesting to notice that naturalists will find a ready means of enhancing the value of their collections, not only of birds, as before noticed, but of insects. Lord Walsingham, we are told, has a large collection of butterflies and moths which are mounted in this way, surrounded by the smallest weeds and plants on which they feed.

Botanical specimens for all purposes, particularly in schools, &c., where botany is taught, may be made of this material with advantage, as the natural specimens are so easily destroyed with handling. Its value for designs for china-painting, where the choice flowers, such as orchids, &c., cannot be procured in their natural state, will be easily appreciated; and models made of it are, in fact, already used by the artists at the Royal Porcelain Works at Worcester for this purpose, as all the detail is faithfully carried out, from the flower of the common nettle to the large oak-bough.

THE LINDSAY'S BRIDAL.

(The first marriage of Colin, Earl of Lindsay and Balcarres, to Maurizia de Nassau, took place in extreme youth, at the court of Jan. 11, under the circumstances and with the result narrated.)

In blithe London Town
Ne'er such bridal was known
As this of Earl Colin the Lindsay so gay:
O'er the Border, in sooth,
Never came bonnier youth,
And the king's self shall give the fair lady away.

The bridemaids and bride
Are here in their pride,
But why ere the rite this long pause and delay?
'Tis for Colin they wait—
The 'Light Lindsay' is late:
The bridegroom forgetteth his own marriage-day!

The envoy was meet,
And the bridegroom is fleet,
He stands at the altar in bridal array:
But what lacks he now?
Why this cloud on his brow?
The ring that should make her his countess for aye!

Oh, a ring's easy found,
'Mid the guests standing round!
And a borrowed ring served on that strange marriage-day:
But when spoke was the oath
That united them both,
She looked on the ring, and she fainted away.

'Twas a ring with a tomb
And a legend of gloom,
And she wist that to death she was wadded that day.
They cheered her amain;
But, alas, 'twas in vain!
And she drooped and she died ere a year was away.

JETTY VOGEL.

The Conductor of CHAMBERS'S JOURNAL begs to direct the attention of CONTRIBUTORS to the following notice:

- 1st. All communications should be addressed to the 'Editor, 339 High Street, Edinburgh.'
- 2d. For its return in case of ineligibility, postage-stamps should accompany every manuscript.
- 3d. To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, should have the writer's Name and Address written upon them in FULL.
- 4th. Offerings of Verse should invariably be accompanied by a stamped and directed envelope.

If the above rules are complied with, the Editor will do his best to insure the safe return of ineligible papers.

Printed and Published by W. & R. CHAMBERS, 47 Paternoster Row, LONDON, and 339 High Street, EDINBURGH.

PREHISTORIC MAN.

THE early history of man in every country is shrouded in considerable mystery and uncertainty. Of our own history, we have fairly full and accurate knowledge as far back as the days of the Saxon kings; but beyond that period, the light of history gradually fades into tradition. In seeking to follow the earlier history, even the light of tradition soon fails us, and we are left in complete darkness. The history of some other countries reaches further into the gloom of the past. But even Greece and Egypt have their dim dawn of history, beyond which the voice of massive ancient Sphinx and temple-ruins of the one are silent, and the beautiful myths of the other have no "B.B." record. When, however, tradition fails us, we have not by any means reached the farthest point in the history of the race. At that point, geology comes to our assistance with revelations of men of the rudest stage of life living in prehistoric ages under circumstances of great interest. It is to this early age of which geology speaks, that we here turn attention.

The peat-mosses of Denmark supply important data for the early history of man in that country. In these peats are imbedded many relics of a people who dwelt in that region long before the present race had migrated thither. These relics consist chiefly of curiously formed implements and weapons in stone and bronze—hammer, arrow, and spear heads, hatchets and knives, &c. Now, peat is formed slowly. It is the result of the annual growth and decay of numerous marsh-plants—each year's mass of dead rushes, reeds, and grasses being overgrown by the vegetation of the succeeding year. The formation takes place in marshy hollows; and in process of time, consolidates and sinks into the soft soil on which it rests. The growth of each year, however, adds only a very thin stratum to the formation, and when this is pressed by the strata of subsequent years, it sinks into still smaller compass. The Danish peats attain a thickness of about thirty feet, and they must therefore have been a very

considerable time under formation. Imbedded in peat are often found the trunks of trees; indeed, in some instances part of a forest growing in the hollow in which peat was being formed, has been choked by the rank growth of marsh-plants, and the soil becoming too moist for the favourable growth of the trees, they, robbed of their strength from these two causes, have fallen a prey to storms, and become overgrown with peat. Thus single trees or clusters of trees, or even whole forests, may be part of a peat-moss.

In these Danish peats occur, at different depths, the remains of three kinds of trees. At or near the surface, the remains are of beech-trees; farther down we find remnants of oaks; and still lower and near the bottom of the moss, are discovered remains of the Scotch fir. This gives us a provisional chronology. At the present time, firs and oaks are not found in the country; but beeches attain a perfect growth in very large numbers. During the time of the Roman empire, Denmark was famous for its growth of beeches; in all probability, all through the historic period the characteristic tree-growth of this locality has been beeches. It is certain that oaks have never been predominant in Denmark during any period of the historic epoch. The prehistoric period of man's life upon the globe is divided into three divisions—the Stone age, the Bronze age, and the Iron age. These distinctions are based upon the character of the tools and weapons that he used. Lucretius hit on what was in reality these divisions when he said:

Man's earliest arms were fingers, teeth, and nails,
And stones, and fragments from the branching woods;
Then copper next; and last, as ~~the~~ ^{the} traces,
The tyrant iron.

Now the implements of the prehistoric age found in the upper portion of the Danish peats, and associated with the remains of beeches, are made of iron. Those that occur farther from the surface in conjunction with remains of oaks are of bronze; while those that lie nearer the bottom of the peat by the side of the ancient firs, are made of stone.

Here is evidence of an early race of men existing in three stages of antique civilisation. In the first instance, when the plains of Denmark were clothed with the graceful forms of the *Pinus silvestris*, came men into the country, who were in a rude state of what can be called by no other name than barbarism. They had no notion of obtaining or working the metals, but were content to make their implements of the rough flints that lay at their feet. They may have been driven westward by stronger and more powerful tribes, or may have wandered hither and settled by the mere accident of a gipsy-like life.

As time moved on, and the events in the public and private life of that antique colony came and went, a change gradually came over the land and people. The Scotch firs, from some cause or other, passed away, and in their place grew stalwart oaks. The people developed in many ways, so that they were now able to carry on rude mining operations, and, by alloying tin with copper, produce bronze, of which henceforth they made their implements. All the relics associated in the peats with oaks are of bronze. It is interesting to remember that the 'more modern' ancients procured their tin chiefly from the mines of Cornwall, and it may have been that the people of this Bronze age found their way in their rude canoes to the coasts of Cornwall, or, at anyrate, obtained their tin from other tribes who had done business with the earliest of the Cornish miners.

In process of time, another change occurred. The conditions favourable to the growth of the oak ceased to exist, and in place of the defunct emblems of strength and durability, came a growth of fine beech-trees, which has continued, as we have seen, to beautify the country down to the present time. The people, too, improved in their knowledge of the arts, and were now able to manufacture their various articles out of the more refractory iron.

We have thus evidence of what, for the sake of clearness, we may term three distinct ages, though there is no real distinction, because one period glided into another as imperceptibly as our old year is followed by the new. First was a time when the land was covered with beech-trees, and the people worked their implements out of iron. This period, viewed broadly, joins the historic and the prehistoric into one. Second was an age when, in place of the present beeches, stalwart oaks grew in large numbers, and the inhabitants of the country separated the softer metals from their ores, and, by mixing them, produced bronze, of which material they then made their tools. Third was a time reaching still further into the uncertainty of the prehistoric era, when the graceful form of the *Pinus silvestris* grew about the sites of the present neat-mosses, and man, with rude uncultured notions on everything, and devoid of the

broader lights that have cheered and helped him on in later days, with a kind of superior cunning instinct, shaped his early implements rudely out of the flints that came readily to his hand. It is easy to understand that a vast amount of time is necessary to bring about so great a variation in the conditions that govern the growth of vegetation as to cause three great changes in the kinds of trees that have grown in the land to occur in a given locality. Yet, long time as this requires, man has, in Denmark and in several other countries, been co-existent with the history of these changes.

In peats of the Bronze age, scarcely any human bones have been discovered, though they occur in peats of the Iron and Stone ages, and the other relics of man are about equal in all the three epochs. Scientists seem to agree in referring this to the probability that the people of this epoch always burned their dead. It is certain that cremation is a very ancient custom, and this theory, it is to be presumed, accounts for the not finding human remains in the deposits of this period.

The *Kjulkens-middings*, or *Kitchen-middens*, found on the shores of some of the Baltic islands, tell of the Stone age, and give evidence of the existence of man at a very remote period. The kitchen-middens are large refuse-heaps left by the former inhabitants of these islands, and consist chiefly of the cast-away shells of the oyster, cockle, periwinkle, and other edible mollusks. Sir Charles Lyell says of these remains: 'No implements of metal have ever been detected. All the knives, hatchets, and other tools are of stone, horn, bone, or wood. With them are often intermixed fragments of rude pottery, charcoal, and cinders, and the bones of quadrupeds on which the rude people fed. These bones belong to wild species still living in Europe, though some of them, like the beaver, have long since been extirpated in Denmark. The only animal which they seem to have domesticated was the dog.' There is geological evidence that at the time this people were thus feasting on local mollusks, Denmark was more intersected by fjords than it is now. In some places, the land has encroached on the sea; in others, the waves have eaten their way into the old coast-line. This is further evidence of the antiquity of the race that first lived in this district. It may also be mentioned that the bones of the Great Auk, which is now considered quite extinct, occur in these *middings* in very large numbers; also that some of the testacea that occur in the refuse-heaps have since that time partially removed from these shores, while others have diminished in size.

The Stone age is the oldest prehistoric era we have any evidence of; but it is subdivided into two periods—the *Paleolithic* (ancient-stone) and the *Neolithic* (new-stone). The flint weapons of the Neolithic period, manufactured when man had made some little progress in the art of tool-making, are better finished than those of the Paleolithic period. Those of the earlier period

(the Palæolithic) are so crude and ill finished that it is sometimes difficult to distinguish between them and pieces of flint worn and chipped by the forces of nature. The relics of the Danish peats are referable *only* to the Neolithic period. Before the earliest immigrants of the rude tribes of the Neolithic age had made their homes among the prehistoric firs of Denmark, there had roamed over vast tracts of country, not very far removed from that locality, a race of men, if possible more simple in their modes of life and workmanship—the men of the Palæolithic age. But, between this age and the Neolithic of the Danish peats a subdivision has been defined. In the caves in the south of France occur vast quantities of the bones and horns of the reindeer. In some cases, separate plates of molars of the mammoth, and several teeth of the great Irish deer (*Cervus megaloceros*) and of the cave-lion (*Felis spelæa*), and an extinct variety of *Felis leo*, have been found mixed up with cut and carved antlers of the reindeer.

This period has been named by French geologists the Reindeer age, because the remains of that animal occur in very great profusion in these French caves. As a proof of the existence of man at a time when the reindeer and several other animals, now confined to far higher latitudes, roamed as far towards the equator as the south of France, perhaps farther, it is to be noticed that not only are his implements found side by side with the remains of the reindeer in such a manner as to show that they were deposited at the same time, but many of the antlers of that animal are cut and rudely carved, bearing ample evidence of the work of a more or less intelligent race of men. On one of the bones found in a cave of the Reindeer age, the outlines of the great mammoth have been rudely carved by some ingenious hand, long since laid to rest; and the long curved tusks and shaggy coat of wool are easily recognisable. M. Leust thinks that this places beyond all doubt that the early inhabitants of these caves must have seen, at least, a few specimens of this species of elephant roaming through these regions. The presence of the mammoth, one of the mammals of the Tertiary epoch, long ages ago quite extinct, known to have been clothed with a warm coat of shaggy hair and wool, is evidence at once of the great antiquity of the age in whose broken monuments we are able to read fragments of a witching history, and of the prevalence of a far more severe climate at that period than that which the southern countries of Europe enjoy now. It is evident that in this period we approach a time when the winters of the whole of Europe were much longer and more severe, and accompanied by a short, almost imperceptible summer; in fact, that we are in the midst of lingering evidences of a severe climate that the great Glacier age left behind it for a long time after our valleys were emptied of their snow and our waters cleared of ice.

But beyond the Neolithic and the Reindeer ages lies the Palæolithic epoch, reaching back still further into prehistoric times. The tools and implements of man referable to this epoch are found chiefly in the *high-level* gravels of our valleys, and are of the rudest type. They occur mixed with bones of the horse, bear, tiger, deer,

hippopotamus, rhinoceros, and extinct species of the hyena, in such a manner as to leave no doubt of their coexistence with these animals. They are 'always unground, having evidently been brought to their present form simply by the chopping off of fragments by repeated blows, such as could be given by a stone hammer.' The gravels in which these relics are found flank the modern rivers, but occupy a much higher level, sometimes being as high as a hundred feet above the bed of the present river, although there is no doubt they were formed by it. In some instances there may be three series of these ancient gravels in one valley, one above the other, forming well-defined terraces, and marking former levels of the river that now flows at the bottom of this valley. In such a case, the relics found in the uppermost two terraces, which would, of course, be the oldest, would probably be of the Palæolithic age—rudely formed, unpolished, and without any ornamentation. The remaining gravels of more recent date would probably, contain Neolithic and bronze weapons, the flints being ground, polished, and rudely ornamented.

It is difficult to form any approximate idea of the vast antiquity of these Palæolithic gravels. Since they were laid down, and those early prehistoric men lived in these localities, the rivers over vast tracts of country have slowly cut their way through, in some instances, over a hundred feet of hard rock, and spread the sediment around their mouths or over the bottom of the sea. What a vast amount of time it must have required to scoop out the valleys of a country to a depth of a hundred feet! And it is to be remembered that all through the historic period, to a very large extent, no change has taken place in the relative position of these rivers and valleys. We quote Sir Charles Lyell again, who says: 'Nearly all the known Pleistocene quadrupeds have now been found accompanying flint knives or hatchets in such a way as to imply their coexistence with man; and we have thus the concurrent testimony of several classes of geological facts to the vast antiquity of the human race. The disappearance of a large variety of species of wild animals from every part of a wide continent must have required a vast period of time for its accomplishment; yet this took place while man existed on the earth, and was completed before that early period when the Danish shell-mounds were formed. The deepening and widening of valleys implies an amount of change of which that which has occurred during the historical period forms scarcely a perceptible part. Ages must have been required to change the climate of wide regions to such an extent as completely to alter the geographical distribution of many mammalia, as well as land and freshwater shells. The three or four thousand years of the historical period do not furnish us with any appreciable measure for calculating the number of centuries which would suffice for such a series of changes, which are by no means of a local character, but have operated over a considerable part of Europe.'

In these gravels we gather all that is at present known of that earliest period on which history sheds no light. This period probably reaches back into the closing acts of the physical

drama of the great Glacial age, when the valleys and plains of the northern hemisphere, down to the fortieth parallel of latitude, were groaning beneath the burden of grinding glaciers and untold depths of snow; while the rivers were mostly covered with thick ice, and the seas were full of icebergs floating, with infinite collisions, to the southward, or covered with hummocked, snow-covered icefloes, as the arctic seas are to-day. Amid scenes like these, these earliest pioneers of the races of men struggled through their first experiences of the rough world. Could these scenes, through the touch of some magic wand, be reconstructed, and made to pass in dioramic form before our eyes, how interesting they would be! How closely we should listen to their stories of that far-gone age, could the men who lived while these gravels were being formed, spring to life again and tell us what they saw, and knew, and felt! What problems might thus be satisfactorily solved! But such cannot be: the past has successfully buried its dead; and what we know of its history must be through the tortuous course of induction.

But these men were most probably hunters; their business was to live. And no trapper of modern American fable could want higher or, to us, more interesting game. Across the snow-clad plains roamed herds of the gigantic mammoth in search of food; wild savage bears kept cover under the brushwood of the forests; and packs of hungry wolves, on the scent of prey, filled the clear frosty air with their dismal cry, as their modern representatives in Russia and other countries do to-day. The magnificent Irish deer—not then extinct, and than which no deer of modern age has antlers half so large, or has half so noble an appearance—galloped with bounding, graceful step across the plains of Ireland. Bears hibernated through the greater part of the severe, almost endless winter; and when the climate became suitable, cunning beavers followed their life's work by the side of broad shallow rivers that drained continents, part of which are now no more. As the climate became warmer when the age of boulder-drift was past, ferocious tigers prowled around man's rude hut in search of sweet morsels—veritable ancestors of modern 'man-eaters'—and in the vicinity of the rivers, the huge hippopotamus and scale-covered crocodile sought their livelihood. Among this variety of animal life, and in the excitement of a hunter's existence, during the latter part of the great Glacial age, lived these Palæolithic men, clothing themselves from the bitter cold with the warm furs of the animals their superior intelligence enabled them to trap, or that came within reach of their curiously flint-barbed arrows, and living almost entirely on the game they were able to 'bag.'

The question that should most concern us is not who and what were the ancestors of the human race, but what men are to-day, and what they may well become. It is said that 'history repeats itself;' probably it is partially true. The chief business of man in relation to the question of evolution, which the consideration of this subject may tend to lead back to, is to see that that part of history which tells of an early crude barbarism in the ancestry of men does not repeat itself. It rests with men of

to-day whether Macaulay's savage from southern climes shall, or shall not, at some future time stand on London Bridge and contemplate the ruins of a fallen greatness.

IN ALL SHADES.

BY GRANT ALLEN,

AUTHOR OF 'BABYLON,' 'STRANGE STORIES,' ETC. ETC.

CHAPTER XXXII.

NEXT day was Tuesday; and to Louis Delgado and his friends at least, the days were now well worth counting; for was not the hour of the Lord's deliverance fixed for eight o'clock on Wednesday evening?

Nora, too, had some reason to count the days for her own purposes, for on Tuesday night they were to have a big dinner-party—the biggest undertaken at Orange Grove since Nora had first returned to her father's house in the capacity of hostess. Mr Dupuy, while still uncertain about Harry Noel's precise colour, had thought it well—giving him the benefit of the doubt—to invite all the neighbouring planters to meet the distinguished member of the English aristocracy: it reminded him, he said, of those bygone days when Port-of-Spain was crowded with carriages, and Trinidad was still one of the brightest jewels in the British crown (a period perfectly historical in every English colony all the world over, and usually placed about the date when the particular speaker for the time being was just live-and-twenty).

That Tuesday morning, as fate would have it, Mr Dupuy had gone with the huggy into Port-of-Spain for the very prosaic purpose—let us faintly confess it—of laying in provisions for the night's entertainment. In a country where the fish for your evening's dinner must all have been swimming about merrily in the depths of the sea at eight o'clock the same morning, where your leg of mutton must have been carcering joyously in guileless innocence across the grassy plain, and your chicken outlets must have borne their part in investigating the merits of the juicy caterpillar while you were still loitering over late breakfast, the question of commissariat is of course a far less simple one than in our own well-supplied and market-stocked England. To arrange beforehand that a particular dusky fisherman shall stake his life on the due catching and killing of a turtle for the soup on that identical morning and no other; that a particular oyster-woman shall cut the hives for the oyster sauce from the tidal branches of the mangrove swamp not earlier than three or later than five in the afternoon, on her honour as a purveyor; and that a particular lounging negro coffee-planter somewhere on the hills shall guarantee a sufficient supply of black landcrabs for not less than fourteen persons—turtle and oyster and crab being all as yet in the legitimate enjoyment of their perfect natural freedom—all this, I say, involves the possession of strategical faculties of a high order, which would render a man who has once kept house in the West Indies perfectly capable of undertaking the *res frumentaria* for an English army on one of its innumerable slaughtering picnics for the extension of the blessings of British rule among a

totally new set of black, benighted, and hitherto happy heathen. Now, Mr Dupuy was a model entertainer, of the West Indian pattern; and having schemed and devised all these plans beforehand with profound wisdom, he had now gone into Port-of-Spain with the buggy, on hospitable thoughts intent, to bring out whatever he could get, and make arrangements, by means of tinned provisions from England, for the inevitable deficiencies which always turn up under such circumstances at the last moment. So Harry and Nora were left alone quite to themselves for the whole morning.

The veranda of the house—it fronted on the back garden at Orange Grove—is always the pleasantest place in which to sit during the heat of the day in a West Indian household. The air comes so delightfully fresh through the open spaces of the creeper-covered trellis-work, and the humming-birds buzz about so merrily among the crimson passion-flowers under your very eyes, and the banana bushes whisper so gently before the delicate fanning of the cool sea-breezes in the leafy courtyard, that you lie back dreamily in your folding-chair and half believe yourself, for once in your life, in the poet's Paradise. On such a veranda, Harry Noel and Nora Dupuy sat together that Tuesday morning; Harry pretending to read a paper, which lay, however, unfolded on his knees—what does one want with newspapers in Paradise?—and Nora almost equally pretending to busy herself, Penelope-like, with a wee square of dainty crevel-work, concerning which it need only be said that one small flower appeared to take a most unconscionable and incredible time for its proper shaping. They were talking together as young man and maiden will talk to one another idly under such circumstances—circling half unconsciously round and round the subject of both their thoughts, she avoiding it, and he perpetually converging towards it, till at last, like a pair of silly, fluttering moths around the flame of the candle, they find themselves finally landed, by a sudden side-slight, in the very centre of an actual declaration.

'Really,' Harry said at length, at a pause in the conversation, 'this is positively too delicious, Miss Dupuy, this sunshine and breeziness. How the light glances on the little green lizards on the wall over yonder! How beautiful the bougainvillea looks, as it clammers with its great purple masses over that big bare trunk there! We have a splendid bougainvillea in the greenhouse at our place in Lincolnshire; but oh, what a difference, when one sees it clambering in its native wildness like that, from the poor little stunted things we trail and crucify on our artificial supports over yonder in England! I almost feel inclined to take up my abode here altogether, it all looks so green and sunny and bright and beautiful.'

'And yet,' Nora said, 'Mr Hawthorn told me your father's place in Lincolnshire is so very lovely. He thinks it's the finest country-seat he's ever seen anywhere in England.'

'Yes, it is pretty, certainly,' Harry Noel admitted with a depreciating wave of his delicate right hand—'very pretty, and very well kept up, one must allow, as places go nowadays. I took Hawthorn down there one summer

vac., when we two were at Cambridge together, and he was quite delighted with it; and really, it is a very nice place, too, though it is in Lincolnshire. The house is old, you know, really old—not Elizabethan, but early Tudor, Henry the Seventh, or something thereabouts: all battlements and corner turrets, and roses and port-cullises on all the shields, and a fine old portico, added by Inigo Jones, I believe, and out of keeping, of course, with the rest of the front, but still, very fine and dignified in its own way, for all that, in spite of what the architects (awful prigs) say to the contrary. And then there's a splendid avenue of Spanish chestnuts, considered to be the oldest in all England, you know (though, to be sure, they've got the oldest Spanish chestnuts in the whole country at every house in all Lincolnshire that I've ever been to). And the lawn's pretty, very pretty; a fine stretch of sward, with good parterres of these ugly, modern, jam-tart flowers, leading down to about the best sheet of water in the whole county, with lots of swans on it.—Yes,' he added reflectively, contrasting the picture in his own mind with the one then actually before him, 'the Hall's not a bad sort of place in its own way—far from it.'

'And Mr Hawthorn told me,' Nora put in, 'that you'd got such splendid conservatories and gardens too.'

'Well, we have: there's no denying it. They're certainly good in their way, too, very good conservatories. You see, my dear mother's very fond of flowers: it's a perfect passion with her; brought it over from Barbadoes, I fancy. She was one of the very first people who went in for growing orchids on the large scale in England. Her orchid-houses are really awfully beautiful. We never have anything but orchids on the table for dinner—in the way of flowers, I mean—we don't duo off a lily, of course, as they say the aesthetes do. And my mother's never so proud as when anybody praises and admires her masdevallias or her thingumbobianas—I'm sorry to say I don't myself know the names of half of them. She's a dear, sweet, old lady, my mother, Miss Dupuy; I'm sure you couldn't fail to like my dear mother.'

'She's a Barbadian too, you told us,' Nora said reflectively. 'How curious that she too should be a West Indian!'

Harry half sighed. He misunderstood entirely the train of thought that was passing that moment through Nora's mind. He believed she saw in it a certain *rapprochement* between them two, a natural fitness of things to bring them together. 'Yes,' he said, with more tenderness in his tone than was often his wont, 'my mother's a Barbadian, Miss Dupuy: such a grand, noble-looking, commanding woman—not old yet; she never will be old, in fact; she's too handsome for that; but so graceful and beautiful, and wonderfully winning as well, in all her pretty, dainty, old coffee-coloured laces.' And he pulled from his pocket a little miniature, which he always wore next to his heart. He wore another one beside it, too, but that one he didn't show her just then: it was her own face, done on ivory by a well-known artist, from a photograph which he had begged or borrowed from Marian Hawthorn's album twelve months before in London.

'She's a beautiful old lady, certainly,' Nora answered, gazing in some surprise at Lady Noel's clear-cut and haughty, high-born-looking features. She couldn't for the moment exactly remember where she had seen some others so very like them; and then, as Harry's evil genius would unluckily have it, she suddenly recollected with a start of recognition: she had seen them just the evening before on the lawn in front of her: they answered precisely, in a lighter tint, to the features and expression of Isaac Pourtales!

'How proud she must be to be the mistress of such a place as Noel Hall!' she said musingly, after a short pause, pursuing in her own mind to herself her own private line of reflection. It seemed to her as if the heiress of the Barchadian brown people must needs find herself immensely lifted up in the world by becoming the lady of such a splendid mansion as Harry had just half unconsciously described to her.

But Harry himself, to whom, of course, Lady Noel had been Lady Noel, and nothing else, as long as ever he could remember her, again misunderstood entirely the course of Nora's thoughts, and took her naïve expression of surprise as a happy omen for his own suit. 'She thinks,' he thought to himself quietly, 'that it must be not such a very bad position after all to be mistress of the finest estate in Lincolnshire! But I don't want her to marry me for that. O no, not for that! that would be miserable! I want her to marry me for my very self, or else for nothing.' So he merely added aloud, in an unconcerned tone: 'Yes; she's very fond of the place and of the gardens; and as she's a West Indian by birth, I'm sure you'd like her very much, Miss Dupuy, if you were ever to meet her.'

Nora coloured. 'I should like to see some of these fine English places very much,' she said, half timidly, trying with awkward abruptness to break the current of the conversation. 'I never had the chance, when I was last in England. My aunt, you know, knew only very quiet people in London, and we never visited at any of the great country-houses.'

Harry determined that instant to throw his last die at once on this evident chance that opened up so temptingly before him, and said with fervour, bending forward towards her: 'I hope, Miss Dupuy, when you are next in England, you'll have the opportunity of seeing many, and some day of becoming the mistress of the finest in Lincolnshire. I told you at Southampton, you know, that I would follow you to Trinidad, and I've kept my promise.—Oh, Miss Dupuy, I hope you don't mean to say *no* to me this time again! We have each had twelve months more to make up our minds in. During all those twelve months, I have only learned every day, whether in England or in Trinidad, to love you better. I have felt compelled to come out here and ask you to accept me. And you—haven't you found your heart growing any softer meanwhile towards me? Will you unsay now the refusal you gave me a year ago over in England?'

He spoke in a soft persuasive voice, which thrilled through Nora's very inmost being; and as she looked at him, so handsome, so fluent, so

well born, so noble-looking, she could hardly refrain from whispering low a timid 'Yes,' on the impulse of the moment. But something that was to her almost as the prick of conscience arose at once irresistibly within her, and she motioned away quickly, with a little gesture of positive horror, the hand with which Harry strove half forcibly to take her own. The image of scowling Isaac Pourtales as he emerged, all unexpectedly, from the shadow the night before, rose up now in strange vividness before her eyes and blinded her vision; next moment, for the first time in her life, she perceived hurriedly that Isaac not only resembled Lady Noel, but quite as closely resembled in face and feature Harry also. That unhappy resemblance was absolutely fatal to poor Harry's doubtful chance of final acceptance. Nora shrank back, half frightened and wholly disenchanted, as far as she could go, in her own chair, and answered in a suddenly altered voice: 'Oh, Mr Noel, I didn't know you were going to begin that subject again; I thought we met on neutral ground, merely as friends now. I—' gave up my answer definitely long ago at Southampton. There has been nothing—nothing of any sort—to make me alter it since I spoke to you then. I like you—I like you very much indeed; and I'm so grateful to you for standing up as you have stood up for Mr Hawthorn and for poor dear Marian—but I can never, never, never—never marry you!'

Harry drew back hastily with sudden surprise and great astonishment. He had felt almost sure she was going this time really to accept him; everything she said had sounded so exactly as if she meant at last to take him. The disappointment took away his power of fluent speech. He could only ask, in a suddenly checked undertone: 'Why, Miss Dupuy, you will at least tell me, before you dismiss me for ever, why your answer is so absolutely final.'

Nora took up the little patch of crewel-work she had momentarily dropped, and pretended, with rigid, trembling fingers, to be stitching away at it most industriously. 'I cannot tell you,' she answered very slowly, after a moment's long hesitation: 'don't ask me. I can never tell you.'

Harry rose and gazed at her anxiously. 'You cannot mean to say,' he whispered, bending down towards her till their two faces almost touched one another, 'that you are going willingly to marry your cousin, for whom your father intends you? Miss Dupuy, that would be most unworthy of you! You do not love him! You cannot love him!'

'I hate him!' Nora answered with sudden vehemence; and at the words, the blood rushed hot again into Harry's cheek, and he whispered once more: 'Then, why do you say—why do you say, Nora, you will never marry me?'

At the sound of her name, so uttered by Harry Noel's lips, Nora rose and stood confronting him with crimson face and trembling fingers. 'Because, Mr Noel,' she answered slowly and with emphasis, 'an impassable barrier stands for ever fixed and immovable between us!'

'Can she mean,' Harry thought to himself hastily, 'that she considers my position in life too far above her own to allow of her marrying

me?—O no; impossible, impossible! A lady's a lady wherever she may be; and nobody could ever be more of a lady, in every action and every movement, than Nora, my Nora. She *shall* be my Nora. I *must* win her over. But I can't say it to her; I can't answer her little doubt as to her perfect equality with me; it would be far too great presumption even to suggest it.

Well it was, indeed, for Harry Noel that he didn't hint aloud in the mildest form this unlucky thought, that flashed for one indivisible second of time across the mirror of his inner consciousness; if he had, heaven only knows whether Nora would have darted away angrily like a wounded tigress from the polluted veranda, or would have stood there petrified and chained to the spot, like a Gorgon-struck Greek figure in pure white marble, at the bare idea that any creature upon God's earth should even for a passing moment appear to consider himself superior in position to a single daughter of the fighting Dupuys of Orange Grove, Trinidad!

'Then you dismiss me for ever?' Harry asked quivering.

Nora cast her eyes irresolutely down upon the ground and faltered for a second; then, with a sudden burst of firmness, she answered tremulously: 'Yes, for ever.'

At the word, Harry bounded away like a wounded man from her side, and rushed wildly with tempestuous heart into his own bedroom. As for Nora, she walked quietly back, white, but erect, to her little boudoir, and when she reached it, astonished Aunt Clemmy by flinging herself with passionate force down at full length upon the big old sofa, and bursting at once into uncontrollable floods of silent, hot, and burning tears.

POPULAR LEGAL FALLACIES.*

BY AN EXPERIENCED PRACTITIONER.

LOTTERIES AND ART-UNIONS.

THE laws of England relating to lotteries may conveniently be divided into three classes, according to the objects which are sought to be attained thereby. (1) The imposition of penalties. (2) The punishment of offenders as rogues and vagabonds. (3) The legalisation of art-unions. The inconsistent provisions of the Act of Parliament relating to the third class, with the tone of legislation within the first and second classes, have led to some curious misconceptions. For example, in Wales, especially in South Wales, and to a smaller extent in some counties of England, it is generally believed that a common raffle can be made quite legal by advertising it as being conducted upon art-union principles; although—as we shall presently show—there is no connection between the two, and therefore no ground for the supposition that the pretence implied in the words quoted has any real existence.

The pernicious effects of lotteries appear to have early been a subject of careful attention on the part of the legislature. To go no farther back than the year 1698, we find it recited that 'several evil-disposed persons for divers years

last passed have set up many mischievous and unlawful games called lotteries, not only in the cities of London and Westminster and in the suburbs thereof and places adjoining, but in most of the eminent towns and places in England and in the dominion of Wales, and have thereby most unjustly and fraudulently got to themselves great sums of money from the children and servants of several gentlemen, traders, and merchants, and from other unwary persons, to the utter ruin and impoverishment of many families, and to the reproach of the English laws and government, by colour of several patents or grants under the Great Seal of England for the said lotteries or some of them, which said grants or patents are against the common good, trade, welfare, and peace of His Majesty's kingdoms.' It was accordingly enacted that any person keeping, &c., any lottery either by dice, lots, cards, balls, or any other numbers or figures, should be liable to a penalty of five hundred pounds, one-third part thereof for the use of His Majesty, his heirs and successors; one other third part thereof to the use of the poor of the parish where such offence should have been committed; and the other third part thereof with double costs to the use of the informer suing for the same. In the year 1806, the latter part of the preceding enactment was altered to this extent—the whole of the penalty was to go to the Crown, and no proceedings were to be taken for recovery of penalties inflicted by any of the laws concerning lotteries except in the name and by the authority of the Attorney-general for the time being. Since the last-mentioned date, the proceedings for recovery of penalties under the former Act have been very rare, although the law stands thus to the present day.

It is somewhat remarkable that many of the enactments against lotteries have been contained in Acts of Parliament by which government lotteries were authorised, thus leading to the inference that the raising of money for the service of the state, which must necessarily lead to the same evils of gambling, &c., as the lotteries set up by the 'evil-disposed persons' against whom the former legislation was aimed, was of more importance than the cause of morality which had been sought to be served by the imposition of penalties so heavy. The persons who availed themselves of the advantages offered by the keepers of unauthorised lotteries were not allowed to go free from the danger of being proceeded against for penalties; but these penalties were much more moderate, being only twenty pounds for each offence.

The second branch of our subject—the punishment of keepers of lotteries as common rogues and vagabonds—had its origin in the year first mentioned, and has now become an ordinary part of the law applicable to the punishment of vagrancy, although it must be noted that there is no necessary connection between vagrancy as universally understood and this statutory definition. A man who is convicted of an offence against a certain law is held to be a rogue and vagabond, and is thereby rendered liable to imprisonment with hard labour for three calendar months; and if he should commit the offence specified, he is what the law calls him, although

* It should be understood that this series of articles deals mainly with English as apart from Scotch law.

he should be a respectable tradesman, a clergyman, or a justice of the peace. There is nothing practically obsolete about this branch of the law. Seldom is Christmas allowed to pass over without some prosecutions under the Vagrants' Act for raffles or some other forms of lotteries in some part of the kingdom or other; and the effect of this has been to render almost unknown in some towns and cities the drawings which were so numerous in the days of our youth. One form of petty lottery which has engaged the attention of the police at all times of the year is the insertion of small sums of money in packets of sweets and other articles principally sold to children, for which there have been several convictions within the last few years. If the principle be admitted that the moral effects of lotteries are pernicious, then it follows that this mode of instilling the gambling spirit into the tender minds of children is its most injurious manifestation, on account of its tendency to train up the children in the way in which they should not go; and the probability that the spirit thus implanted in their minds will be more fully developed as they grow up.

Besides the penalties and punishments provided for the conductors of, and participants in lotteries, there is a distinct set of enactments which aim at the prevention of advertising lotteries, whether English or foreign. So far as the latter class is concerned, the law has no power to interfere with the persons implicated therein so long as they are without the jurisdiction of our courts. But if any person in the United Kingdom should endeavour to spread the knowledge of such schemes by allowing advertisements to be inserted in his newspaper or other periodical, or by printing and distributing notices relating thereto, then the law provides that he shall become liable to a penalty of fifty pounds besides full costs; and the same penalty applies to private lotteries which may have been established in this country.

In the year 1846, an Act of Parliament was passed for legalising art-unions. The following are the requisites for enabling an Association of individuals interested in the promotion of art to take advantage of the protection thus afforded. The Association must be purely voluntary, and must not be established for the acquisition of pecuniary profit, the subscriptions—beyond the necessary expenses—being entirely expended in the purchase of drawings, paintings, and other works of art for distribution amongst the subscribers. The art-union which is to be protected by the Act must either have been incorporated by royal charter, or a license must be obtained from the Board of Trade, after the deed of settlement, or the rules and regulations of the Association—as the case may be—have been submitted to that honourable body for approval. Whenever the Association is so conducted as to become perverted from the purposes contemplated by the Act, power is reserved to revoke the charter, &c., previously granted to such Association. It will be observed that the provisions respecting art-unions are not of an elastic nature; but that the protection intended to be afforded by the Act is strictly limited to Associations for artistic purposes, established under government sanction and supervision. Hence, it should be noted that the advertising of an intended lottery

which has not been so sanctioned, as being on art-union principles, would be of no avail to protect the managers of such a lottery from prosecution under the vagrancy laws; or from action for penalties at the suit of the Attorney-general for the time being.

It is not our present purpose to attempt to criticise or to vindicate the laws in question; we simply explain how the law stands, and leave to others to reconcile the principles of legislation in the interests of morality, which appear to place art upon a pedestal outside the sphere of moral considerations.

WHERE THE TRACKS LED TO.

IN FOUR CHAPTERS.—CHAP. I.

I HAVE been often much inclined to write down the particulars of a remarkable business I was once engaged in, which was not only queer and full of unexpected turns in itself, but was of unusual interest to me personally. The account will also be curious, as showing how much, or how little, of the qualities the public always will assign to us is required. I had been in the metropolitan police, and, when my story begins, had just retired on a decent superannuation. While in the force, I think I had as much experience as many of the men who have been talked about; but I never before met with anything in the least like the incident I am going to describe.

I was pensioned off late in the year, in November; so, as Christmas drew near, I had not yet grown tired of the pleasure of being my own master, and would sit, after the gas was lighted, by the hour at a time alone with my pipe, picturing how I ~~would~~ enjoy myself in the holidays, when some of my friends would be coming up to London; for I had not much of a family party at home, as I lived with my daughter, the only one left with me out of four. She was now nineteen years old, and just like her mother, as I remembered her, some thirty years before. Winifred—called so after a favourite sister of my wife, who died young—was a very pretty girl, as many others besides me thought; and wonderfully steady too. She was a dressmaker; none of your day-workers or needlewomen, but really an artist—I believe that is now the correct name; and at the West End would have commanded a high salary. She could have gone to the West End easily enough; but she would not do this, nor would she live in the house where she was employed, and where she might have had, young as she was, full charge of a department. She would not leave her father, who, she knew, if she went away, would be dull and mopish in the house without her.

Well, as you see, I was comfortable enough, and truly thankful that I had for ever done with station-houses, police courts, prison vans, and the like, of which I had grown heartily tired. I had bought a couple of fowls, with ceteras, for our Christmas dinner; and I am not at all ashamed to say that I stoned the plums, chopped the snet, cut up the peel, and did a lot more towards getting the pudding ready; Winny of course finishing everything, polishing off my

rough work, so to speak. Everything of this kind being done, my time hung a little heavy on my hands. It was only one clear day from Christmas, so the shops would be gay and busy, and I should have enjoyed a stroll through the streets; but in the morning a cold drizzle had set in, which made the pavements greasy and everything around sloppy, forbidding all chance of a saunter. Luckily, the omnibus which passed Winifred's shop also passed our door, so she could ride every yard of the way.

I made up my mind to do the best I could with the newspaper, and a nap in my easy-chair—this had already grown into a habit—and was turning away from the window, when I saw a shabby-looking man run up the three steps which led to our front door. I am a pretty good judge of a man by his looks, and I at once decided that this was not only a shabby man, but that he was in the law; he seemed the sort of man who would be 'put in possession;' and I was not far wrong. The man knocked. I heard him ask for me; then the servant—not mine, I had none, but the servant of the house—said a gentleman wanted to see me. I already knew what kind of gentleman this was, and had a vague prophetic feeling that he was coming on no very pleasant errand; however, I told the girl to show him in.

He entered, and at once said: 'Mr Holdrey. I know you, of course; and I dare say you know me. At anyrate, I am a clerk in Mr Browle's office, and I have come from him.'

I recognised the man now. I knew him and his master well enough. Dicky Browle, we used to call the lawyer. He had a good deal of business, but all of the lowest kind, and was, in fact, so mixed up with the worst of the class who got into 'trouble,' that I often wondered how it was that he escaped getting into trouble himself, for many was the felony he had been the means of 'squaring' or compounding. One or two of these cases I knew of to an absolute certainty; but the knowledge never came to me at a time or in a manner so that I could use it. As just said, I expected him to get into trouble some day, and thought, on hearing the messenger, that the day had come.

'Well,' I answered shortly, 'what do you want of me?'

'Mr Browle wishes you to go up to the Central Criminal at once, if you please, Mr Holdrey,' returned the man. 'You know Sam Bracey, I believe—Long-necked Sam, they call him—he is in trouble, and wants you as a witness.'

Know Long-necked Sam! I should think I did! There were few old officers in the force who did not know him.

'What is he in trouble about? and what does he want me for?' I naturally asked. 'I have heard nothing of this.'

'No. The governor did not know that you could say anything until this morning,' replied the clerk. 'Sam is up for burglary. He has been in trouble so often, that a very little will send him for life.'

He went on to say that Sam declared that I, and no one else, could save him; and so, almost before I had made up my mind on the subject, I found I had pulled on my coat and was in a 'bus with the clerk.

He apologised for not calling a cab by saying that it 'was dead low water with Sam,' and the governor did not care about laying out more money than could be helped. This, however, did not explain why I was wanted; and the inside of a 'bus not being a good place for talking secrets, we said little more until we got down at the corner of the Old Bailey, and then there was too much hurry to think of talking.

Sam's trial had begun; the facts were so simple that it was not likely to last long. A robbery had been committed, somewhat early in the night—eleven or twelve o'clock—at a house in Camberwell. Two of the residents in the next house saw a man leap from a back window into the garden, and gave the alarm. This man the witnesses believed to be Sam. They had even described the burglar as having a remarkably long neck; and the accused being notoriously a bad character, the event was likely to be against him. Mr Browle hurried to me the moment I entered the court—leaving the then witness to go without cross-examination—and thanked me for coming. 'We hardly hoped it, you know,' continued the legal gentleman, 'as you had not been subpoenaed, and I know you do not think much of Bracey. But the man is innocent this time; he is, indeed, Mr Holdrey.'

I naturally asked about my expenses and so forth—I did this as a matter of business—before I entered on what I was expected to prove.

'Don't hesitate over that, there's a good fellow,' said Browle. 'Sam will pay you; you know he will, for he is honest enough in private life, even if he is not so professionally. I don't think you are the man to sacrifice a poor wretch for the sake of your fees; but if you insist—why, I will guarantee them myself, and it is no business of mine to do that, as you know.'

I was fairly surprised at this, and liked the old fellow for being so much in earnest. I felt that I could not let him outdo me, and said so.

Two minutes told me what I was expected to say, and the case for the prosecution being closed, I was at once called on. I was the only witness for the defence. Long-necked Sam was not likely to call any of his friends as to character, and indeed all his 'pals' were shy of showing themselves in the Old Bailey when the trials were on and the police about. Bracey had recollected on the very morning of the trial, that the day on which the burglary took place was the St Leger day, and that I had met him late in the evening and expressed my wonder that he was not down at the races. Had he not been able to fix the day by this incident, it would have gone hard with him; but I was able to prove beyond all sort of doubt that I was in his company, fully five miles from the scene of the burglary, at the very moment the robber, whoever he was, was leaving the house. So it was impossible that Sam could have been the burglar, and the case virtually broke down at once.

The prosecuting counsel and, for the matter of that, the judge also, or I fancied so, looked anything but pleased at my interferences, and some of my old comrades rallied me a little on my new friends—but that was all in good temper.

Sam met me outside the court, and rough as he was, the tears stood in his eyes as he thanked me. 'I won't ask you to have a glass with me, Mr Holdrey,' he said, 'because I know I am not in your line. I daresay you will live to see me in the dock again and to hear of my getting a lifer. But if, afore that comes on, I can do anything to show you what I think of you to-day, I will do it; and if I send that pretty daughter of yours a present—and I have watched her bright face many a day, when she did not know I was looking at her—if I send her a present, it shall be something as I have come by honestly, and that she needn't be afraid of taking from my hands.'

Having got rid of him, I went home, all the more disposed to enjoy my daughter's conversation—and she had always plenty to tell me of her little adventures during the day—and all the more inclined to enjoy my unread newspaper, from the long and disagreeable business I had gone through.

Winnie came in soon after me; her place had closed a little earlier, being so near Christmas. I was glad I had got home first, as she might have been anxious about me and my going off so suddenly. I told her my adventures; and when I said it was almost a pity that I had been able to clear such a bad lot as Sam undoubtedly was, and had always been, as he would be sure to do some harm soon, she put her hand over my mouth, to prevent my saying anything so wicked. The poor creature had one more chance, she said, and perhaps he would make good use of it—there was hope for everybody. I knew, better perhaps than she did, how much hope there was for Sam; but Winnie was always soft-hearted, and took the most favourable view of everything. I gave way to her; and somehow, she seemed to be more affectionate than ever that night, and I felt pleased at the idea of a quiet evening with her. Then she got her needlework, and I my pipe, while the beating of the rain against the window—for the wind had risen at nightfall—made everything seem brighter and cosier than before. I had scarcely taken a single whiff, when I heard a vehicle stop opposite the house, then a double knock followed. 'Some one for the landlord,' I thought. But no; it was for me, and for the second time that day I told the servant to show a strange gentleman in.

This arrival was a very different-looking man from the shabby clerk from Browlie the lawyer, but his errand was much the same in effect. It was to 'take me out; indeed, a cab had been brought so that no time should be lost, and the stranger was directed to take me to the private house of Mr Thurles—Mr Thurles of Cornhill, the man explained.

I knew who Mr Thurles was—knew where he lived, and knew his house of business as well as I knew St Paul's; but I had never spoken to him; and what he wanted me for, I could not guess. And what was stranger, the messenger knew little more than I did. He was valet, or butler, or something; but all he had been told was to ask Mr Holdrey to accompany him, and to say, if any objection should be made, that money was no object. He believed it was about a robbery—that was all he knew.

This sounded stranger still; and I turned to my daughter to say something about it, when I was horrified at her pale, almost ghastly looks. All the bloom had gone from her face, and she held one hand on her breast as if to stop her heart from beating too violently.

'Wby, Winnie, what are you frightened at?' I exclaimed. 'There is no harm in my being sent for by Mr Thurles, who is a highly respectable gentleman. You should not let yourself be excited.'

'O father!' she said, 'it was so unexpected, so sudden—I thought—I do not know what I thought.' She faltered as she spoke, and the tears were in her eyes.

This was so different from her usual cheerful manner, that I would not go out until she had recovered herself. Perhaps I should not have gone then, but that a young friend of her own happened to call in, and so I was more satisfied to leave her.

My companion scarcely spoke during the ride; and when we arrived at the square where Mr Thurles lived, I was at once shown up into the library, where the gentleman was waiting for me. I never saw a harsher or sterner looking man than the merchant. He was, I supposed, about sixty years old, with thin iron-gray hair, gray bushy whiskers, and large heavy eyebrows, which, when he frowned, gave an expression to his face which was anything but pleasant.

He came to business directly, and spoke in just the tone one would have expected from such a man. 'You are, or were, Sergeant Holdrey, of the — division, I believe?'

I replied that he was right.

'I have sent for you,' he went on, 'because our house was interested in a case managed by you, and I then made up my mind that if ever I wanted a detective, you should be the man.'

I began to say something about my feeling flattered by being thus distinguished; but he continued, without taking notice of it.

'You will be paid well; and the quicker you are, the better I shall pay you. I am inclined to think that you will not find your work specially difficult. I believe I know who is wanted, but I must have better information. My counting-house has been robbed, the safe opened with false keys, and ransacked.'

'It has been kept very quiet,' I said, as he paused; 'for I have never heard a word of it. I hope you did not lose much?'

'It has been kept quiet,' answered Mr Thurles; 'no one out of my establishment knows of it, and very few of our own people have more than a dim idea of the right story. We did not lose much; only the outer safe was opened. The thieves had not the keys of the inner one, which contained a large amount in money; but perhaps they did not want to open that.'

'Not want to?—I began, in some astonishment, for such an idea was enough to astonish anybody, when he again snapped me up sharply.

'If you will listen to me, and not interrupt,' was his pleasant remark, 'you may understand your instructions the sooner. The person who stole, or caused to be stolen, what really was taken, wanted only a couple of bills, accepted by Waterman & Co.—Do you know the firm?'

'No; I can't say I do. I know most of the City houses, but I never came across them.'

'And you are not likely to do so,' he returned; 'for there is no such firm in existence. The bills were forgeries. They were never intended to get into my hands, and no doubt would have been taken up by the drawer. But the holders were pressed for money, and gave them to another firm not much better off, who handed them to us. I did not believe that a large house, as I heard Waterman & Co. were, would have anything to do with such small matters; and some other things, trivial enough in themselves, adding to my suspicions, I caused inquiries to be made, with the result I expected—that is, of finding they were forgeries. The next thing was to trace them; and as I was already pretty certain of the forger, I should easily have done that, when the office was entered, the safe unlocked, not forced, so it must have been done by some one who had access to the keys. These hills were stolen, so all proof is lost. But if I cannot trace the forger, I may be the burglar, and that is what I want you for—and for this I will pay five hundred pounds.'

He went on to explain that he was not upon good terms with his wife. But I could have told him all about that; every one in the City knew that he had married a widow of great wealth, who had an only son, and that he had almost broken the poor woman's heart by his coldness and neglect. There had been no open outbreak or scandal, but they were separated; the son, who was now some four or five and twenty years old, being a sort of link between the pair, by remaining in his step-father's counting-house.

All this, with a very different colouring, the merchant told me now. I could have saved him the trouble, but you should always let such persons have as much talking as they like. When he had finished this part, he told me something which surprised me. He had reason to believe, he said, that this step-son, Godfrey Harleston, was the person who forged these bills and who robbed the office. There were marks on the counting-house window frames and sills which showed that the burglar had entered and left by that way; indeed, it would have been almost impossible for any one to leave by the front of the house without attracting attention. All this was clear enough; but then he went on to say that he would cheerfully spend a thousand pounds, besides the reward, to bring the crime home to his step-son, who, he explained, was a thoroughly bad character, and had been a thorn in his side for a long time.

'If he is as bad as you are, old gentleman,' I thought to myself, 'he must be a bad one indeed.'

I took a great dislike to Mr Thurles for showing such bitter animosity to the young fellow; but I could see that the chief aim of the merchant was to wound his mother through him; and although, after seven-and-twenty years in the police, it took more than a little to upset me, I could hardly stand this. However, some one else would have the job if I did not, so I agreed to undertake the business.

I was to do what I liked, spend what I pleased, and have whatever help I wanted; but I do

not care much about help. In some things, of course, you must have people with you; but, as a rule, a single man can do all there is to be done, and when he works, he is sure to be always working on the same line, which is more than you can be certain of when there are two or three of you in it. Nor did I see that laying out much money would help us. I told him so; and before I left him, had given him a sketch of what I thought would be a good beginning.

He rang for a bottle of port and some cigars. After a time, I went home in capital temper with myself, and talked my last cigar out with Winny, who was sitting up for me, and still, I thought, looking anything but her usual self.

MUSICAL SAND.

Most persons have heard of stones which on being struck give out musical notes, and many may have seen the arrangement of such stones known as the Rock Harmonicon, which is capable of discoursing eloquent music. But the existence of musical or sonorous sand is not so well known, although such sand appears to occur in localities widely distributed over the earth's surface. A paper giving some interesting particulars respecting this phenomenon was communicated to the meeting of the American Association for the Advancement of Science at Philadelphia in 1884, by Professor Bolton of Hartford, Connecticut, and Dr Alexis Julien of New York. The authors begin their paper by stating that at the Minneapolis meeting of the Association they had given some account of the so-called 'Singing Beach' at Manchester-by-the-Sea, Massachusetts, and of the occurrence of sonorous sand at Egg, in the Helvides, and other localities. During the twelve months that had elapsed, they had continued their researches; and by means of extensive correspondence, they had established the fact, that sonorous sand, instead of being a rarity, is of very common occurrence. Circulars were sent to all keepers of life-saving stations throughout the United States; and from the replies received to date, a list of seventy-four localities in America had been obtained.

Through the Smithsonian Institution, specimens of sonorous sand had been received from the island of Bornholm, Denmark; Colberg, Prussia; and Kanai, Hawaii Islands. Experiments had been conducted both at Manchester-by-the-Sea and at Far Rockaway, Long Island, to determine accurately the properties of sonorous sand, with the object of explaining the cause of its singular characteristics. It was found that the loudest sound of which a given sand is capable was most conveniently produced by confining a quart or more in a bag and strongly striking together the contents. Sounds thus produced were heard distinctly at both the Manchester and Rockaway beaches at a distance of one hundred and fifty to two hundred feet, the distance varying according to the strength and direction of the wind and the interference of the surf-noise. At Rockaway, a careful experiment was made in fields removed from the beach. The sound produced by striking the bag was heard at a distance of four hundred and fifty feet, measured by a tape-

line. The sound has a hoot-like tone, easily recognised.

The character of the sounds obtained by friction on the beach is decidedly musical, and the experimenters were able to indicate the exact notes on a musical staff. The shrillness and lowness of note depend chiefly on the quantity of sand disturbed. By plunging both hands into the sand and bringing them together quickly, a tone is heard of which the dominant note is

B below the treble staff

By stroking

the sand nearer the surface and with less force, very high notes were heard confused. They ranged from E, fourth space treble clef, to B above the staff. By rubbing firmly and briskly a double handful of the sand, several notes on a rising scale were heard. The ear received an impression something like that formed by sliding a finger up a violin string at the same time that the bow is drawn. These results were obtained at Manchester. The Rockaway beach gave somewhat different tones—the B below the ledger-line was not heard at all; but the note F, first space treble, B, C, and G above the staff, were heard at different tunes according to the manner of the friction. The notes were determined by comparison with those made on a violin, concert pitch.

The evanescent character of the acoustic quality of the sand is strongly marked. Sand which has been recently wet requires thorough drying before it resumes its acoustic powers; consequently, sandy beaches do not always possess the sonorous power in equal measure, and the seeker sometimes fails to discover musical sand in the locality reputed. Meteorological conditions decidedly affect the sonorousness.

Musical sand is easily deprived of its acoustic qualities. Besides wetting it, friction between the dry hands also accomplishes the result. The quickest way of 'killing' the sand—except by water—is to shake a small quantity in a tin box. When first agitated, a peculiar sound is heard, which entirely ceases after twenty to twenty-five slow up-and-down movements of the box. Attempts to restore to 'killed' sand its sonorous properties have met with indifferent success. Sonorous and mute sand occur in the beach closely adjoining, but they cannot be distinguished by the eye; friction alone determines the difference. In sand of strongly marked acoustic properties, a tingling sensation is perceived in the finger and also in the toe, even through the boots.

Caroful search in literature shows that allusions to sonorous sand are scattered sparingly through writings of a thousand years. An obscure allusion to the phenomenon occurs in one of the stories of the *Arabian Nights*. Old Chinese chronicles mention sonorous sand as occurring in the desert of Lob-nor. Marco Polo narrates superstitions concerning it. The Emperor Baber, refers to a locality in Afghanistan; and many travellers in the East describe hills of moving sand whence issue mysterious noises. The famous Jebel Nakous, situated on the east coast of the Gulf of Suez, has been visited by at least six European and American travellers,

including Ehrenberg, who was there in 1823. By comparing their descriptions, it has been discovered that they describe not one locality, but two, or possibly three, in the same region. The dry sand rests on a steep incline, and when agitated, slides down the slope with a gradually increasing noise, variously described, but the loudest tones of which are universally compared to distant thunder. In 1850, Hugh Miller discovered musical sand at Eigg, in the Hebrides. In 1882, Professor Bolton visited the same locality and began a monograph.

Microscopical examination of the samples of musical sand showed that the great majority were remarkable for a certain degree in uniformity of size—usually about 0.3, 0.4, 0.5 millimetres in diameter, general round form, polished surfaces, and freedom from fine dust or minute fragments; consequently, they often present a characteristic oolitic or roe-like appearance, light colour, and mobile condition. At certain localities, the sonorous sand has been found to present the decided features of a quicksand; and a general connection between these two facts is suspected to prevail wherever the conformation of coasts and oceanic currents permit the concentration of the sonorous sand below the high-tide mark.

The information on this curious subject collected by the two American savants may perhaps set some of our readers to search for 'singing beaches' on these islands. The phenomenon is well worthy of investigation, and no light seems as yet to have been thrown on its cause, nor any progress made towards the solution of the mystery of the difference between mute and musical sand.

NOSES.

A POPULAR lecturer in one of his discourses had occasion to speak on noses, and he himself, 'defective only in his Roman nose,' declared, had he the choice of noses, his face should be ornamented by a 'regular weather-cutter.' The desire was commendable and worthy attention, for strangers are instinctively judged by their noses. The nose indeed proclaims the man, and is the outward and visible symbol of inward mental calibre and intellectual character. Men of note almost invariably possess decided and prominent 'leading articles;' whilst an insufficient nasal accompaniment not unfrequently denotes inanity, lack of moral vigour, and at once negatives qualities which would otherwise give respect and credit. Of course there are extremes and exceptions; but generally, it is, that the more prolonged the proboscis the more striking is the countenance, and the more original the force of character.

An extreme case is recorded of a Lancashire man, whose prodigious feature became a centre of attraction in the busiest thoroughfares of Manchester, whilst he was on a visit there. Becoming at length either tired or confused by the inquisitive attention and wonderment of a crowd of admirers, he seized his nose with both hands and gave it a sudden impatient twist, as though removing an obstruction from the footway, and said sharply: 'There—be quick, and get past as soon as you can.'

A Yorkshire manufacturer whose good living had given him 'a nose as red as a comet,' was

told by a wealthy friend very bluntly, 'I couldn't afford to keep that nose of thine.' Another friend assured him he had no cause for fear of not living comfortably, for should all other means of subsistence fail, he could easily hire himself out as a railway danger-signal.

Amongst the South Sea islanders, the nose is made to be a medium of expression of affection and amity. Tribes swearing everlasting peace, seal the compact with a promiscuous rubbing of noses against noses; by the same frictional process, maidens declaim their woes at parting end joys on reunion with other maidens, the action being attended by—so said an eye-witness—the shedding of a power of tears. Lovers make their amatory declarations through their noses, their courtship being a protracted series of rub-rub-rubbing of nose to nose.

We recall an interruption Dr Dinney had whilst he was preaching on one occasion. He saw opposite to him in the gallery a countryman making elaborate preparations for putting his handkerchief to the common usage appointed to it. The doctor became interested, and stayed expectant in his discourse just before the crisis. The countryman blew a terrible blast, awakening the echoes, and almost perceptibly shaking the building to its foundations. The doctor, having

Met with many a breeze before,
But never such a blow,

waited for the fainting echoes to die, and then said with impressive gravity: 'Let us now resume.'

Charles Lamb's rebuke to a man who by self-assertion pronounced himself devoid of any peculiarity, ought not to be omitted. 'Wh-which hand do you b-h-blow your n-n-nose with?' inquired Lamb.

'With my right hand, to be sure.'

'Ah!' said Lamb pensively, 'that's your pe-pe-peculiarity. I b-b-blow mine with my hand-kerchief.'

The nose is quite a proverbial topic; for example, 'To turn up the nose,' 'Put his nose out of joint,' 'Paid through his nose,' and 'Putting his nose to the grindstone,' 'Led by the nose,' with many others equally felicitous. 'Driving hogs over Swarston Bridge' is a Derbyshire polite way of expressing snoring; and several stories are told respecting pig-drivers. A small boy was once asked: 'Is your elder brother musical?'

'Yes, sir; 'e is that.'

'Can he play?'

'O yes, sir; 'e plays beautiful.'

'On what instrument does he perform?'

'Why, sir, 'e plays on his nose!'

A celebrated divine was preaching before the king and court in Stuart times, when the monarch and several noblemen 'noddod gentle assents' to all he said, for 'they slumbered and slept.' The divine, wishful to reprove, but fearful to offend, at last summoned courage to shout to one of the somnolent nobles: 'My lord, my lord, don't snore so loud, or you'll waken His Majesty!'

The subject has not commended itself generally to poets, yet there are few who would be inclined to say that there is nothing poetical about the nose. Here end there, we do find pointed references in poetry to the homely fea-

ture more or less poetical in expression. We can easily fancy Cowper's picture of 'the shivering urchin, with dewdrop at his nose'; whilst our poet-laureate indulges in a higher flight over a maiden's nose 'tip-tilted like the petal of a flower,' which sounds very refined indeed. Henry, Lord Brougham, whose nose was somewhat of this latter order, did not feel flattered by a similar reference to it. In conducting a case in Yorkshire, he was bothered in cross-examining a witness by a constant repetition of the word 'humbug,' 'Humbug,' said Lord Brougham—'humbug, what do you mean by humbug?'—'Whoy,' returned the Yorkshireman, 'if I wer to tell ye 'at ye'd gotten a nice nose, I should be humbugging ye.'

Punch frequently alludes to the subject, and in its pages is to be found a description of what some suppose to be a masonic sign, under the terms of 'taking a sight' and 'taking a double sight.' 'In taking a sight' the thumb of one hand is placed to the extreme tip of the nose, with the fingers extended to their straightest utmost capacity; whilst 'taking a double sight' involves the addition of the second hand to the first, the thumb to the little finger, and action as before. The action is more varied and considered more expressive when a slight undulatory movement is observed by the fingers. The London newsboy appreciates the practice of taking a sight, especially favouring it when he has managed to sell, under the cry of 'Third edition,' a day but one before yesterday's paper to a passenger upon an omnibus.

Nursery rhymes are not complete without a nose or noses, and they are constantly being quoted, for instance:

Says Moses to Aaron:
'Thy nose is a rare un!'
Says Aaron to Moses:
'Let us swap noses!'

And we cannot forget:

The servant in the garden hanging out the clothes,
By came a dickey bird and popped off her nose!

'I am satisfied on every point but one,' said a gentleman to an applicant for service—'I cannot get over your nose.'

'That is not to be wondered at, sir,' replied the applicant, 'for the bridge is broken.'

This last incident gives us a moral wherewith to adorn our paper, that, out of all noses collective, defective, conceptive, or reflective, it is better to have an ill-shaped nose than no nose at all.

SMOKING AND SNUFFING IN CHURCH.

AMONGST the 'things not generally known' to the present generation is that smoking has been indulged in in the churches of Great Britain, in various parts of 'the continent'—particularly in the Netherlands—and in South America. It is nevertheless true. It must not, however, be inferred from this statement that the practice was so general amongst the male portion of the congregation as it is in the 'smoking concerts' of our day, or that the fairer sex participated in the 'weed' during the performance of divine worship. The practice prevailed, let us hope, to only a very limited extent; but that it had been carried on in church during the delivery

of the sermon, in the church immediately after service, and in the vestry during the holding of service, and at other times, there is reliable evidence to prove. In England and Scotland, smoking in religious edifices was practised more or less during the greater portion of last century, if not the whole of it, and down into the present century. In Dutch and South American churches, smoking has been indulged in down to a very recent period. Snuff-taking in churches is a practice which is common throughout the European continent. It has also prevailed in the churches of both England and Scotland for a long period; but the snuff-takers in places of worship of to-day are not so demonstrative as were those of 'the good old times,' of which we read and hear about, but fail to realise.

Readers of Sir Walter Scott may remember that mention is made in *The Heart of Midlothian* of a smoker of considerable local importance, named Duncan of Knockunder. Of him it is written: 'So soon as the congregation were seated after prayers, and the clergyman had read his text, the gracious Duncan, after rummaging the leathern purse which hung in front of his petticoat, produced a short tobacco-pipe made of iron, and observed almost aloud: "I hae forgotten my splenchan (tobacco-pouch), Lachlan; gang down to the clachan and bring me up a pennyworth of twist." Six arms, the nearest within reach, presented, with an obedient start, as many tobacco-pouches to the man of office. He made choice of one with a nod of acknowledgment, filled his pipe, lighted it with the assistance of his pistol-flint, and smoked with infinite composure during the whole time of the sermon. At the end of the discourse, he knocked the ashes out of his pipe, replaced it in his sporran, returned the tobacco-pouch to its owner, and joined in the prayer with decency and attention.'

In a volume of letters written by the Rev. John Disney of Swinderly, Lincolnshire, to James Grainger, is a communication bearing the date December 13, 1773, in which this passage occurs: 'The affair happened in St Mary's Church in Nottingham, when Archbishop Blackburn (of York) was there on a visitation. The archbishop had ordered some of the apparitors, or other attendants, to bring him pipes and tobacco and some liquor into the vestry, for his refreshment after the fatigue of confirmation. And this coming to Mr Disney's ears, he forbade their being brought thither, and with a becoming spirit remonstrated with the archbishop upon the impropriety of his conduct, at the same time telling His Grace that his vestry should not be converted into a smoking-room.' Mr Disney was grandfather to the writer of the letter above quoted, and was the vicar of Nottingham; local writers, however, who refer to this matter attribute the desire to drink and smoke in St Mary's to the Rev. Dr Richard Reynolds, who was consecrated to the bishopric of Lincoln in 1723, and died in 1744.

The Rev. S. Parr, LL.D., was an everlasting smoker. 'Morning, noon, and night,' might he have been seen enveloped in clouds of tobacco-smoke. Neither time nor place seemed to him to be inappropriate for the indulgence. When he was perpetual curate of Hatton, in Warwickshire

(1783-80), he regularly smoked in the vestry whilst the congregation were singing, immediately before the delivery of his sermon. For this purpose, the hymns selected were lengthy. The doctor frequently remarked: 'My people like long hymns; but I prefer a long pipe!' In all probability, his pipes on such occasions (to be somewhat in character with the place), were of the kind known as 'churchwardens.' The Rev. Robert Hall, the distinguished Baptist preacher, indulged in profuse smoking in the intervals of public worship.

A well-known writer to periodical literature tells us that only last autumn he spent a few hours at Edam, one of the so-called 'Dead Cities of the Zuyder Zee,' though a quietly active and bustling little place, and a great centre of the Dutch cheese-trade. The minister, in pointing out and explaining the various matters of interest about the interior, smoked a cigar and offered our informant one.

Respecting the practice of smoking in churches in South America, Mr J. M. Cowper of Canterbury writes: 'I remember three instances of smoking in church in Lima, Peru. In the church of La Merced, I saw a layman surreptitiously enjoying his cigar while service was going on. In the vestry of the same church I saw a full-robed bishop smoking before going into the pulpit to preach. In his case, a friendly layman put a handkerchief under the episcopal clum, to keep the ashes from falling on the smoker's robes. In the cathedral vestry, I saw the "Master of the Ceremonies" (an Englishman) smoking a cigar. A spittoon is placed in the stall of each cathedral dignitary.'

The Vice-chancellor of Cambridge issued some regulations previous to the visit of King James I. in 1615, in which it was enjoined 'That noe graduate, scholler, or student of this universitie presume to take tobacco in St Marie's Church upon payne of final expellinge the universitie.' This most probably referred to snuffing rather than smoking. 'It is hardly possible that a prejudice, in no degree abated, against smoking in church could have been defied so openly at such an early stage in the introduction of tobacco. On the other hand, a pinch of snuff is easily conveyed to the nostrils with a fair degree of secrecy.' It must be remembered that at this period snuffing was in great favour with the faculty, who recommended it as the best preventive as well as cure for cold in the head.

A late rector of Hackney, the Rev. Mr Goodchild, used to refresh himself in the middle of his sermon with a tremendous pinch of snuff, which he conveyed, from his chamouis-leather-lined waistcoat pocket, to his nose. A Free Church minister in Glasgow, one Sunday morning gave out as the morning lesson the fourth section of the hundred and nineteenth psalm. While his congregation were looking out the 'portion of scripture' in their Bibles, the Doctor of Divinity (or of Laws, we know not which) took out his mull, and seizing a lusty pinch with finger and thumb, regaled his nose with the snuff. He then began the lesson—'My soul cleaveth unto the dust!' The titter that ran round the church, and the confusion of the minister, showed that both the congregation and he felt the Psalmist's 'pinch.'

An English lady, on a visit to Scotland, attended public worship in a parish church at no great distance from Crathie. In the same pew were about a dozen persons—farmers, their wives, and herdsmen. Shortly before the beginning of the sermon, a large snuff-mull was passed to the occupants of the pew. Upon the lady-visitor declining to take a pinch, an old man, who was evidently a shepherd, whispered, in a very significant manner: 'Tak' the sneeshin', mem—tak' the sneeshin'. Ye dinna ken oor meenister; ye'll need it afore he's dune!'

ABOUT DEATH'S-HEADS.

PROBABLY, at some time or other, the reader has found feeding upon the leaves of potatoes a large green, yellowish green, or brown creature about the thickness of his finger, with seven dark purple and yellow-margined streaks upon the sides, and the dorsal portion decorated with black dots; the tail-end, moreover, being adorned with a 'caudal appendage' somewhat resembling a lamb's tail in miniature, save that it is rigid, and not woolly; or it may be that in digging up the crop, if the owner of a garden, he has turned up a reddish-brown 'grub,' which, beyond a jerk or two with the pointed tail segments, seemed incapable of motion. The fate of these creatures is generally a sad and sudden one, if the finder happen to be the rustic unlearned in insect-life. 'Here be a locust; dang the beast!' and down comes the merciless iron heel, and behold, a shapeless mass! Yet the poor things were harmless enough, and known to the entomologist as, in the one case, the larva or caterpillar;—, and in the other, the pupa, of the Death's-head Moth (*Acherontia atropos*).

Most years seem remarkable for the prevalence of some particular form of insect-life. For instance, in 1877, clover fields teemed with golden butterflies, which soon spread into high-roads, and even town gardens. These were the Clouded Yellow (*Colias edusa*), since which only sparingly has the butterfly been seen. Then, in 1879, came swarms of Silver Y Moths (*Phusia gamma*), the caterpillars of which played sad havoc with the farmer's peas, completely stripping them of leaves—to plants, both as lungs and stomach—so that the peas never ripened in the pod. But nature, as we speak, had provided a remedy in the form of flocks of thrushes, which 'fared sumptuously every day' upon the larvæ; and yet so ignorant was the farmer of the help his little feathered friends were rendering him, that he attributed the mischief to 'them rascally birds,' and was for 'shooting them all off.'

Some seasons, the beans in our gardens are thickly covered with insects (*Aphis rumicis*), and ants may be watched busily plying their antennæ, and milking their aphid cows, and sipping up the exuded nectar-like fluid with a gusto an epicure might envy. Or, it may be the pendulous racemes of the Sycamore (*Acer pseudo-platanus*) look as if dipped in ink from the

swarms of a sable dipteran, or fly (*Dilophus febrilis*), thickly aggregated thereon. And last year we had clouds of green-flies—another species of aphid—migrating, in some places even almost stopping traffic, and, in one little town in the south of England, extinguishing the lights in the post-office, and filling eyes, ears, noses, and mouths of the officials to the serious impediment of their duties. So, too, the season of 1885 proved a good one, as the lepidopterist would say, for the larvæ of the Death's-head Moth, in fact, it is doubtful if it had ever been so abundant. It is a grand species—the largest of our native *Sphinxidae*, or Hawk Moths, and interesting in all stages of its existence. It is the only lepidopteron that we possess capable of making any cry; but the caterpillar, pupa, and moth of *Atropos* can all squeak. In putting the moths into a comatose state, prior to consigning them to the ammonia bottle—when needing to kill them for the cabinet—I have applied a camel-hair brush dipped in chloroform to the proboscis, holding them by finger and thumb by the under side of the wings, so as not to disfigure their beauty, I have been surprised at the muscular power exhibited, it being all I could do to prevent their escaping, the insect the while squeaking as loudly as a poor mouse whilst suffering from the tender mercies of Puss.

The caterpillars are not easy to find. We may go over ridge by ridge of the potatoes and not see one, so well hidden are they by protective resemblance to the plants upon which they feed; the colours of the leaves and flowers of the potato, for example, the dark violet petals, and yellow anthers, all being reproduced in the caterpillar. The best and quickest way to discover them is to search for the traces of their repasts, which are collected in little heaps at the bottom of the plant; and if these be fresh, we may be confident that a little scrutiny will speedily reveal an obese, soft larva tightly clasping the stem. The larvæ are found throughout August; and about the beginning of September are full-fed, when they bury beneath the soil, forming a cell in which they turn to pupæ. Sometimes the moth emerges in October or November; but such specimens are generally barren females, and the insect usually remains in pupa condition throughout the winter, coming out about midsummer of the following year.

The moth or imago of *Acherontia atropos* is very handsome; the upper wings have a velvety appearance, the colours being an extremely rich mixture of browns and black and gray, thickly powdered with whitish dots. The lower wings are orange, with two dusky bands crossing from the inner to the hind margin. In the centre of the dark plush-like thorax is a mark curiously resembling a skull, from which the moth takes its name. The body is very thick, with six or seven black transverse bands, and a broad bluish-gray one down the middle. They have a strong penchant for honey, to secure which, they will enter beehives, putting the bees to flight by their bold front, although perfectly defenceless

themselves. There is a superstition still lingering in some parts of the New Forest that the Death's-head Moth was not seen in England till after the execution of Charles I.

THE PIG PEN.

THE question of pig-breeding is one that should force itself on the attention of the farmer, and the many lessons which the situation forces upon the country impressed on his mind. At our agricultural census last year, we found not only that our stock of swine showed a decrease of something like two hundred thousand head since 1884, and of over three hundred thousand head since 1883, but also that the country was understocked in a branch of our agriculture that even in these times leaves a profit. We believe that a corn-mill and a few extra pigs would prove a far better market for inferior corn than any other that can be named. An American writer has told us that 'Cincinnati owes its wealth to the discovery of a method of putting fifteen bushels of corn into a three-bushel barrel and transporting it to distant markets. This has been accomplished by means of the pig. Ho converts seven bushels of corn into one hundred pounds of pork.' This is a lesson that the English farmer might well lay to heart; and if this were the case, we are sure that we should not find the pig-stock of the country declining at a time when prices for corn have just been at the lowest ebb in the memory of man.

That we can find a market for an increased production of pork and bacon is certain. Last year, we paid the foreigner—and chiefly the Yankee—some three millions sterling for dead pig-meat, sent to us in the shape of hams, bacon, and pork. There is no reason why we should not this season increase our breeding-herds of swine and make some attempt to wrest from the foreigner this market. It lies at our doors; and the pig himself is perhaps the most profitable of all the meat-making machinery of the farm. The fecundity of the pig is such that the breeding-stock may be increased almost at will. At one of the prize-farms of the Royal Agricultural Society, last year, the judges report that from nine to ten sows are kept every year, and that from these from fifty to sixty pigs are sold every year. Their prolificness is a source of profit, but not the only one. Mr J. C. Morton points out some other reasons why, in fattening pigs, more profit might be expected than in fattening oxen or sheep. One is, that the carcase of the pig includes the head—so much additional weight—which in the case of the ox or sheep is part of the offal. Another is, that the pig is a feeder on all manner of vegetable and animal refuse, extracting nourishment from matter which other animals refuse; and it is useful, therefore, as a scavenger and utiliser of waste food.

There can be only one answer—and it is one often given in times past to amateurs, who have been so struck with the fecundity of the pig, that they have wondered how it is not more largely bred—that can be given to these claims of the pig to greater attention. 'Oh,' it may be retorted, 'you forget that with the pig, like all other farm-stock, it is a question of how much the land will carry. For his feeding, crops of mangolds, cabbage, carrots, and such-like

are required; and in summer, cut clover is wanted.'

That may oftentimes be a good answer, but not in a season when all kinds of corn can be bought cheap, and when farmers oftentimes are unable to sell their cereals except at a figure at which it is far more profitable to manufacture it into pork, and send it in that form—fifteen bushels in a three-bushel measure—to market. This is a matter well worthy the attention of farmers at the present moment, and a thought that ought to lead to a large increase in the pig-stock of the country.

THE MINSTRELS.

THE minstrel in the gallery,
 • The revellers in the hall :
 Across the pauses of the fæet
 The singers' voices fell,
 But in the tide of mirth below,
 They have no share at all.

They sing of battle and of joust,
 Of deeds of high emprise ;
 They sing of honours bravely won,
 Of lovers' happy sighs,
 Of banquet when the fight is o'er,
 And light of ladies' eyes.

Their stirring thoughts, their tender words
 Float down on music's wing.
 Alas ! the joys, the gallant deeds
 Wherewith their verses ring,
 They know not. Those who hear the song,
 Have known, but cannot sing.

Thus every day, in every age,
 Thrills on the world's fierce heart,
 In passion-heat of joy or grief
 At banquet, fight, or mart ;
 But there the minstrel has no place—
 He needs must stand apart.

Too soft his flesh to bear life's storms,
 Too keen his restless brain,
 His heart too ready to perceive
 Joy's inmost heart of pain ;
 But the lone sorrow of his lot
 Makes sad his merriest strain.

And in his darker hours, the wish
 Consumes him like a fire,
 To cast away for evermore
 The burden of the lyre,
 To share the life of other men,
 Its fullness, its desire.

In vain ! The gladness of the loved,
 The conquest of the strong,
 Life's heavy tasks and fair rewards,
 Not unto him belong.
 He sighs ; and as it leaves his lips,
 This sigh becomes a song.

'CHOP' WITH KING JA-JA.

RUMOURS of war came floating down the Bonny river to the traders at its mouth. The oil-canoes which came sluggishly alongside the towering black hulks brought whispers of solemn palavers and Egbo meetings in the recesses of the far river reaches; and the long black war-canoes of the Bonny chiefs, with their forty or fifty little black slave-boy rowers, were manoeuvring every day with an amount of shrieking and yelling, out of all proportion to the result attained. Will Braid and Yellow, two mighty black chiefs, were understood to be in open rebellion against their lawful sovereign, King Amachree of New Calabar. Fords of mud and wattles had been thrown up on the New Calabar river, and Gatling guns and other gruesome instruments had been mounted thereon, and the two recalcitrant niggers were having a high good time of it challenging the universe at large to mortal combat, and, what was of much more importance, stopping the all-dominating palm-oil trade on the New Calabar river. The puissant kingdom of Bonny, too, next door, was supposed to be mixed up in the quarrel, and was lending more or less overt assistance to the rebellious chiefs, and things were tending generally to one of those lingering, little, all-round wars which so delight the West African nigger, and so sorely afflict the unfortunate white or rather yellow traders who wear out their few years of life on hulks at the mouths of the fever-breeding oil-rivers.

At this juncture, the great king-maker, righter of wrongs, and arbitrator-in-chief, Her Majesty's Consul-general at Fernando Po, was invoked; and the result was the convocation of the greatest 'palaver' that had taken place for years, on board the big hulk *Adriatic* in the Bonny river. One by one the long war-canoes shot alongside, the glistening brown backs of the long line of rowers heaving like one great machine to the rhythm of their shrill song, and the swish and dig of their paddles in the green water. One by one the gorgeous beings who sat on a raised platform

in the centre of each canoe emerged from under the great umbrellas that covered them, and took their places on the quarter-deck of the hulk. They were a motley lot to look upon, these owners of thousands of their fellow-men, many of them decked up for the occasion with gaudy, ill-fitting European garments, but mostly wearing bright plush waistcoats, high hats, and what is called a fathom of cloth round their loins, this fathom of cloth being two large-sized, brilliant-patterned cotton handkerchiefs joined together.

A table covered with the union-jack was placed upon the quarter-deck, under the penthouse roof of the bulk, at which sat the British consul in his war-paint, surely the best of good fellows and finest of officers. Poor fellow! He never wore his war-paint again, as the sequel will show. On each side of the consul sat a wandering M.P. and myself as visitors; and next to us, again, sat Captain Barrow, the secretary of the governor of the Gold Coast, who was down here to prepare for a Niger recruiting expedition; and Captain Von Donop of Her Majesty's ship *Decoy*, whose orders would not allow him to bring his ship into the pestilent river, but who came in himself, accompanied by two black Housse troops. In a semicircle in front of us sat the Bonny chiefs; and similarly behind us were ranged the New Calabar chiefs, most of whom carried a large portion of their wealth round their necks in the form of enormous coral beads, of almost fabulous value, and some of whom had their arms literally covered with beautiful ivory bangles. In advance of the Bonny-men sat King George, a fine, tall, well-educated young negro, well known in London, and a very favourable specimen of his race, but an utter cipher in his so-called kingdom; a well-dressed and well-behaved enough young oil-merchant, but, from a regal point of view, a decided fraud, as his father was before him.

It had been proposed that the neighbouring King Ja-Ja of Ophoh should act as arbitrator in the dispute, which was really between Bonny and New Calabar, the insurgent Will Braid and

Yellow being quite powerless to resist their sovereign without the Bonny-men's assistance; and across the thick yellow haze and sheets of falling rain, which blurred the endless vista of mangrove swamps, we all stretched our eyes to watch for the arrival of King Ja-Ja. But Ja-Ja had once, and not so long ago, been a Bonny chief himself; and after many years of fierce warfare with his great rival, the mighty Oko Jumbo, had slipped away one night in the dark with all his people, his wives, and his riches, and founded a kingdom for himself a few miles away on the Opobó river, where he had waxed rich and powerful; so the wily old Ja-Ja thought it wisest to avoid the reaches of the Bonny, even with the king-making consul as his friend, for who could tell whether the far-reaching vengeance of the dread Oko might extend? So Ja-Ja sent a very diplomatic message, saying he had mistaken the day, and hoped to see the consul next week to talk over the matter at Opobó.

The consul began by stating the case—that he could not allow trade to be stopped by this war, and severely took the Bonny-men to task for helping the rebels to withstand King Amachree, their lawful sovereign—and a great deal more to the same effect, which, being interpreted by the king of Bonny, produced a very depressing effect on gentlemen in front of us, and a most liberal display of ivories and broad smiles from the potentates in our rear. The Bonny-men were ill at ease, and many and many a time their opal eyeballs strained across the yellow mist and falling torrents as their king began, sadly and apologetically, albeit in good English, to reply to the consul's scolding; for the greatest of all Bonny-men, before whom King George is but a puppet—the overpowering Oko Jumbo—had not arrived, and the Bonny-men saw how hopeless was their case with the great white consul against them and their own champion absent.

But suddenly, as the king was speaking, came faintly at first, through the wet sickly air, the shrill song of the paddlers, and a cry went up from the Bonny-men, and many a dusky finger pointed to where Oko's canoe, with its sixty rowers and its ostrich feathers at the prow, came swiftly gliding over the waters. The king ceased speaking with a sigh of relief; and soon the master of Bonny stepped on the hulk's deck. A grand old pagan of the bygone school is Oko Jumbo, tall and strong, with a fine handsome face and powerful head, with very little attempt at European dress, or indeed dress of any sort, although his two sons, who reside mostly in England, are civilised gentlemen.* Oko, in a few trenchant words, closed the business for the day. He would undertake to produce the two rebel chiefs on board the hulk on the next Thursday, if the white consul would guarantee the attendance of King Ja-Ja the arbitrator, all things in

the meantime to remain *in statu quo*. Of course everybody knew that one promise was as improbable of fulfilment as the other; but a palaver which comes to a definite conclusion at a first, second, or even third sitting would be against all precedent, so both sides were satisfied, and the high contending parties adjourned for refreshment, amidst much friendly snapping of fingers and other strange rites.

Early next morning, the little steam launch *Ewaffa* started from Bonny to convey the consul, his secretary, and myself to visit the domains of Ja-Ja. A broad river stretches on either side of us, the waters of which are thick and green with the rotting slime of myriads of fallen leaves. The banks are not of land, but a dense jungle of trees growing down into the water, and dropping long suckers from their outstretched arms to form fresh trees. The roots of this jungle intercept as in a net the mud and slime and vegetable débris brought down by the river, and in course of time the inner parts of the jungle become sufficiently solid to afford footing for crocodiles and hippopotami, but quite impenetrable to human beings, the outskirts of the jungle being always comparatively new trees, growing dense and rank in the water itself, and interlaced thickly with great, strong, green hanging creepers, upon which swing and chatter the mangrove monkeys. As we steam up the river and across its numerous branches, no sound but the shrill chirp of these monkeys breaks the oppressive stillness. Now and again the black snout of a hippopotamus shows out of the thick ooze on the banks, or a motionless crocodile is seen basking in the sun. Occasionally, a long, low canoe glides noiselessly by; the boat, rower, and paddles all jet black, and hardly visible against the dark-green background of impenetrable jungle. The air is soft and sickly, with a whiff now and then of unutterable nastiness. The great fierce sun casts a yellow, all-pervading, hazy glare on the thick water, which is covered with a festering seum of miasmatic air-bubbles.

After some monotonous hours of this unvarying prospect, with a rare glimpse of the far-away sea through some of the maze of creeks, we suddenly stick fast in the mud. Oh, those three hours! Our nude crew of fine stalwart Krooboys up to their waist in water pushing and tugging; the screw of the launch stirring up the horrors at the bottom, and the blistering sun on the fetid water, made up an ensemble I shall never forget. And so we dragged on all the weary day, now sticking fast, now going on a few miles, the consul's secretary already down with fever; past several batteries of Gatling guns mounted upon canoes moored across the mouths of creeks, and past the river and town of Andony, with its little mud battery and six-pounder Krupp guns, until, turning sharply the corner of an island of jungle, we find ourselves in the Opobó river, with the distant sea and the white men's hulks on the horizon. Soon we come to an inlet in the dense mass of verdure, and, passing the mournful wrecks of two hulks half submerged in the muddy ooze, we land, carried on the stalwart shoulders of our Krooboys to a little sandy gully, and are received by about three-quarters of the population of Ja-Ja's kingdom, with perhaps a dozen yards of clothing amongst the lot. Some

* One of these sons died since this was written, and left an English wife and family.

old mazzle-loading guns, nine and eighteen pounders, of obsolete pattern, were scattered about, half buried in the deep white sand, unused and unusable. Inward, following the course of the gully, was what may be called the main street of the town, although no attempt was made at uniformity, the houses, such as they were, merely mud and palm-leaf huts, being scattered at random under and amidst the great palms and india-rubber trees. Followed at a respectful distance by the male portion of the crowd, the females being generally rather shy of white men, and apparently desirous of hiding behind tree trunks and peeping round at us from afar, we advanced up the gully to the interior of the town.

Ja-Ja is a most fanatical fetich-man, and signs of his paganism were to be seen at every few steps in the numerous ju-jus on our way. These ju-jue may, and do, assume any shape, and the most unlikely objects may be made sacred by their dedication, although no information is obtainable with regard to the exact rites practised or the supposed uses of the ju-jus. Idols in the usually accepted sense of the word they certainly are not, but rather things set apart for the worship of unseen spirits, or dedicated to the honour of a certain supposed god. A very common ju-ju, and, as it happened, the first one that met our eyes in Opobo, is a white hen cruelly nailed up alive to the top of a pole and left to starve and flutter to death. Then, in succession, we saw a grotesque human figure of yellow clay surmounted by an ox-skull, and covered with a penthouse roof of thatch; a miscellaneous collection of bones in a suspended grass cradle; a conical mound of yellow clay daubed and decorated with colour, and stuck all over with cocks' feathers; a Bass's beer-bottle on the top of a white pole; and so on *ad infinitum*. The great ju-ju house, however, is much smaller than the celebrated building of human skulls at Bonny, and is a conical mud building with a high thatch roof, surmounted by an ox-skull, and lined with human skulls in the usual artistic, West African fashion.

Wading up to our ankles in mud through the rank dense vegetation, and passing a primitive forge, where four swart negroes were making nails on a stone anvil with a stone hammer, their forge bellows being two sheepskins worked alternately by a man with two short sticks, as if he were playing on a pair of kettledrums—such a hellows and forge, in fact, as you may see any day on the Egyptian hieroglyphics—we caught sight of King Ja-Ja coming to meet us. A brilliant-coloured umbrella was held over his head by an attendant, and, as usual with African chiefs, he was followed by quite a crowd of evil-looking rapscallions of all ages and in all states of undress, carrying a perfect museum of obsolete arms, the staff of state, like a beadle's mace, and other paraphernalia. Ja-Ja is a fine-looking old savage, as black as polished ebony, with hair like silver, and was in full dress to receive us—a red flannel shirt, worn as usual with the tails loose, embroidered most elaborately with the imperial French arms, and plentifully besprinkled with *Ns* and *Es*, the Napoleonic bees, and other emblems of a bygone dynasty in France. This was the king's only garment, except the

usual bandana loincloth of two uncut handkerchiefs.

Ja-Ja received his great patron the consul with much finger-snapping and other signs of friendship, and led the way to his house. The outer wall of his compound, which incloses some three acres of ground, is formed by the huts of his slaves and people, the whole place reeking with filth beyond all European imagination. In the centre of the compound stands a fetich india-rubber tree, with a ju-ju hut under it; and near it is built the house inhabited by some of Ja-Ja's favourite wives; the palace itself being at the end of the compound, and overlooking all. It is a gaudily painted wooden building, raised on piles some eight feet high, and surrounded by a veranda. The house, a new one, is the pride of old Ja-Ja's heart, and was constructed by negro workmen from the British settlement at Accra. It is furnished with a desperate attempt at European style; but the whole effect is, absurdly incongruous with the nude or semi-nude male and female servants, and the evident uneasiness of Ja-Ja himself amongst his civilised surroundings. In the corner of the principal parlour, which leads straight from the veranda, is a most gorgeous red and gold throne, with a liberal allowance of crowns, sceptres, orbs, and 'King Ja-Ja's' scattered on every coign of vantage; and on its topmost pinnacle is stuck jauntily an absurd conical hat like a fool's-cap, with enormous feather-like ears on each side of it, with which head-dress the king volunteered the statement that he had been 'making ju-ju'—whatever that might mean.

I was trying hard, but unsuccessfully, to make out Ja-Ja's extraordinary attempts at pigeon-English, when from the adjoining room came a female voice, which partly explained the attempts I had noticed at European furnishing.

'O yas, sah,' said the voice, with the conical affectation and bombastic intonation of the civilised nigger—'O yas, sah, I see berry seedy, sah; I see miscalkerlated de day, sah!' and thereupon Miss Sally Johnson—'a Barbadian born, sah!'—sailed into the room, positively dressed in a flowing cotton gown of most approved fashion; evidently a very superior person, looking down upon poor Ja-Ja and his people with much commiseration, and not a little contempt. This lady is prime-minister, secretary of state, and Ja-Ja's guide, philosopher, and friend in all that relates to the ways of the white man; and her experience and knowledge of all civilised matters are too great to be questioned within the realms of Opobo. Her initiative with regard to the gown, however, was not followed, for she was the only person dressed in the place, unless we so consider the eccentric harlequin suits of dye upon the children of all ages, and even upon Ja-Ja's marriageable daughters, who were plentifully scattered about the compound. The patterns stained upon the bright sleek brown skins are in some cases, very elaborate and brilliant, and had really a pleasing effect.

Ja-Ja was rather overcome with the responsibility of entertaining the consul and his friend at so short a notice, and seemed so distressed that he had no civilised 'chop' to offer us, that we proposed to go on to the mouth of the river and dine with the white traders in

the hulks, and return on the morrow to a grand 'chop' or banquet at Ja-Ja's. So the old king brought out some calabashes of *mimbo* or palm-wine—which tastes like soap-suds and gin—and, what was more acceptable, a bottle of very drinkable Rudesheimer, and saw us down to our boat, followed by all his rabble rout of subjects.

The next morning, in a tropical downpour, we were received at Opohó with due honour. One of the rusty old guns had been turned right side uppermost, and was being hanged away at a great rate, to the imminent risk of everybody within a hundred yards of it. Ja-Ja, with a largely reinforced guard of more truculent-looking ragamuffins than ever, awaited us on the beach. Tom-toms and horns vied in their din with the shrieks, yells, and howls with which the untutored subjects of Ja-Ja honoured their monarch's guests. In the principal room of the palace we found the table laid for our repast, and Miss Johnson was continually changing from the languid superfluous importance of the reception-room to the fierce invective and stern command of the kitchen, or back again, as circumstances required. It required several applications of severe corporal punishment to the wretched slaves—to judge from the howls we heard when any hitch occurred—before what is termed the 'chop' was served. Neither beef nor mutton can be reared on this pestilential coast, so the choice of viands is not large; but what was wanting in variety was made up in quantity. Kide stewed and roasted whole, great fish, and fowls enough for a ship's company, were served up, all in great clay bowls, and all made into 'palm-oil chop,' the prevailing dish of the coast. This is a sort of greasy curry, made with many spices and the finer parts of the palm-oil, very trying to European stomachs unaccustomed to such delicacies. *Mimbo*, again, was the principal drink, and Ja-Ja pledged us all in *mimbo* many a time and oft; but although I can stand palm-oil or *mimbo*, I cannot stand palm-oil *and* *mimbo*, so contented myself with a beverage at once less soap-suddy and less intoxicating. Ancient steel knives and forks were produced with an air of proud superiority by Miss Johnson for our use; but Ja-Ja, although he made a timid attempt to use them too, soon gave it up as a dangerous experiment, and took to his fingers with a sigh of relief, handing us out the *tibiti*, moreover, by the same medium.

The redoubtable guard flocked round the veranda, and scrambled to every point where a view of our extraordinary proceedings could be gained, and an aggregate of acres of ivories saluted each movement of the wonderful white men who can do everything. Doors and windows were darkened by grinning happy brown faces, and the crowd of servants within the room were envious mortals indeed. Ja-Ja himself was served by the heir-apparent or heir-presumptive of his swampy kingdom; but it is wonderful how little difference there is between heir-apparent and common clay when there is no tailor to accentuate it. The consul seeing the king in so good a temper, broached the subject of a mission-school to be established at Opohó, which Ja-Ja had always refused; but on this occasion he not only promised to allow it, with effusion, but offered to build the house at his own expense. All being arranged about the next palaver at

Bonny, which Ja-Ja promised to attend personally or by proxy, we took our leave with many presents and words of good-will.

Of our tedious, sickly journey back to Bonny, I say nothing here, only that in it our brave, great-hearted consul, as true an Englishman as ever breathed, caught the deadly fever he had defied so long. The next morning, I found him yellow and delirious; and in three days he died, one more sacrifice of England's brightest and best to the insatiable fever-fiend of the West Coast.

IN ALL SHADES.

CHAPTER XXIV.

THAT same afternoon, Rosina Fleming met Isaac Fourtals, hanging about idly below the shrubbery, and waiting to talk with her, by appointment, about some important business she had to discuss with him of urgent necessity.

'Isaac, me fren,' Rosina began in her dawdling tone, as soon as they had interchanged the first endearments of negro lovers, 'I send for you to-day to ax you what all dis talk mean about de naygur risin'? I want to know when dem gwine to rise, an' what dem gwine to do when dem done gone risen?'

Isaac smiled a sardonic smile of superior intelligence. 'Missy Rosie, sweetheart, he answered evasively, 'le-ady don't understand dem ting same as men does. Dis is political business, I tell you. Le-ady don't nebbber hab no call to go an' mix himself up along wit politic an' political business.'

'But I tellin' you, Isaac, what I want for to know is about de missey. Mistah Delgado, him tell me de odder ebberin', when de great an' terrible day come, de missey an' all gwine to be murdered. So I come for to ax you, me fren', what for dem want to go an' kill de poor little missey? Him don't nebbber do no harm to nobody. Him is good little le-ady, kind little le-ady. Why for you don't can keep him alive an' let him go witout hurtin' him, Isaac?'

Fourtals smiled again, this time a more diabolical and sinister smile, as though he were concealing something from Rosina. 'We don't gwine to kill her,' he answered hastily, with that horrid light illuminating once more his cold gray eyes. 'We gwine to keep de women alive, accordin' to de word ob de holy prophet: "Have dey not divided de prey? To ebery man a damsel or two: to Sisera, a prey ob divers colours." What dat mean, de divers colours, Rosie? Dat no mean you an' de missey? Ha, ha, ha! you an' de missey!'

Rosina started back a little surprised at this naive personal effort of exegetical research. 'How dat, Isaac?' she screamed out angrily. 'You lub de missey! You don't satisfied wit your fren' Rosie?'

Isaac laughed again. 'Ho, ho!' he said; 'dat make you jealous, Missey Rosie? Ha, ha, dat good now! Pretty little gal for true, de missey! You tink me gwine to kill him when him is so pretty?'

Rosina gazed at him open-eyed in blank astonishment. 'You don't must kill him,' she answered stantly. 'I lub de missey well meself

for true, Isaac. If you kill de missy, I don't nebbber gwine to speak wit you no more. I gwine to tell de missy all about dis ting ob Delgado's, I tink, to-morrow.'

Isaac stared her hard in the face. 'You don't dare, Rosie,' he said doggedly.

The girl trembled and shuddered slightly before his steady gaze. A negro, like an animal, can never bear to be stared at straight in the eyes. After a moment's restless shrinking, she withdrew her glance uneasily from his, but still muttered to herself slowly: 'I tell de missy—I tell de missy!'

'If you tell de missy,' Pourtales answered with rough emphasis, seizing her by the shoulder with his savage grasp, 'you know what happen to you? Delgado send evil one an' duppy to creep ober you in de dead ob night, an' chatter ober to you, an' tear de heart out ob you when you lyin' asleepin'. If you tell de missy, you know what happen to me? Dem will take me down to de big court-house in Wes'moreland village, sit on me so try me for rebel, cut me up into little pieces, burn me dead, an' trow de ashes for rubbish into de harbour. Den I come, when I is duppy, sit at de head ob your pillow ebberly ebenin', grin at you, make you scream an' cry an' wish yourself dead, till you drihben to trow yourself down de well, or poison yourself for fright wit berry ob manchineel bush!'

This short recital of penalties to come was simple and ludicrous enough in its own matter, but duly enforced by Isaac's horrid shrugs and hideous grimaces, as well as by the iron clutch with which he dug his firm-gripped fingers, nails and all, deep into her flesh, to emphasise his prediction, it affected the superstitious negro girl a thousand times more than the most deliberately awful civilised imprecation could possibly have done. 'You don't would do dat, Isaac,' she cried all breathless, staring in vain to free her arm from the fierce grip that held it resistlessly—'you don't would do dat, me fren'. You don't would come when you is duppy to haunt me an' to frighten me!'

'I would!' Isaac answered firmly, with close-pressed lips, inhuman mulatto-fashion (for when there is a demon in the mulatto nature, it is a demon more utterly diabolical than any known to either white men or black men: it combines the dispassionate intellectual power of the one with the low cunning and savage moral code of the other). 'I would bound you to deat', Rosie, an' kill you wifout pity. For if you tell de missy about dis, dem will cut your fren' all up into little pieces, I tellin' you, le-ady.'

'Don't call me le-ady,' Rosina said, melting at the formal address and seizing his hand penitently: 'call me Rosie, call me Rosia. O Isaac, I don't will tell de missy, if you don't like; but you promise me for true you nebbber gwine to take missy an' kill him.'

Isaac smiled again the sinister smile. 'I promise,' he said, with a curious emphasis; 'I don't gwine to kill him, Rosie! When I take him, I no will kill him!'

Rosina hesitated a moment, then she asked shortly: 'What day you tink Delgado gwine at last to hab him risin'!'

The mulatto laughed a scornful little laugh of supreme mockery. 'Delgado's risin'!' he cried,

with a sneer—'Delgado's risin'! You tink, dem, Rosie, dis is Delgado's risin'! You tink we gwine to risk our own life, black men an' brown men, so make Delgado de king ob Trinidad! Ha, ha, ha! dat is too good, now. No, no, me fren'; dis don't at all Delgado's risin'! You tink we gwine to hand ober de whole island to a pack ob common contemptful naygur fellow! Ha, ha, ha! Le-ady don't nebbber understand politic an' political business. H's, Rosie, I tell you de trut'; when we kill de buckra clean out ob de island, I gwine meself to be de chief man in all Trinidad! And as he spoke, he drew himself up proudly to his full height, and put one hand behind his back in his most distinguished and magnificent attitude.

Rosina looked up at him with profound admiration. 'You is clobber gentleman for certain, Isaac,' she cried in unfeigned reverence for his mental superiority. 'You let Delgado make de naygur rise; den, when dem done gone risen, you gwine to eat de chestnut yourself him pull out ob de fire wifout burn your fingers!'

Isaac nodded sagaciously. 'Le-ady begin to understand politic a little,' he said condescendingly. 'Dat what for dem begin to ax dis time for de female suffrage.'

Grotesque, all of it, if you forget that each of these childish creatures is the possessor of a sharp cutlass and a pair of stout snowy arms, as hard as iron, wherewith to wield it: terrible and horrible beyond belief if only you remember that one awful element of possible tragedy inclosed within it. The recklessness, the folly, the infantile misapprehension of mischievous children, incongruously combined with the strength, the passions, the firm purpose of fierce and powerful full-grown men. An infant Hercules, with super-added malevolence—the muscles of a gorilla with the brain of a cruel schoolboy—that is what the uneducated negro is in his worst and ugliest moments of vindictive anger.

'You don't tell me yet,' Rosina said again, pouting, after a short pause, 'what day you gwine to begin your war ob de deliberance.'

Isaac pondered. If he told her the whole truth, she would probably reveal it. On the other hand, if he didn't mention Wednesday at all, she would probably hear some vague buzzing rumour about some Wednesday unfixed, from the other conspirators. So he temporised and conciliated. 'Well, Rosie,' he said in a hesitating voice, 'if I tell you de trut', you will not betray me?'—Rosie nodded.—'Den de great an' terrible day is comin' true on Wednesday week, Rosie!'

'Wednesday week,' Rosina echoed. 'Den, on Wednesday week, I gwine to make de missy go across to Mistah Hawthorn's!'

Isaac smiled. His precautions, then, had clearly not been unneeded. You can't trust le-ady with high political secrets. He smiled again, and muttered complacently: 'Quite right, quite right, Rosie.'

'When can I see you again, me darlin'?' Rosie inquired anxiously.

Isaac bethought him in haste of a capital scheme for removing Rosina to-morrow evening from the scene of operations. 'You can get away to-morrow!' he asked with a cunning leer. 'About eight o'clock at me house, Rosie!'

Rosie reflected a moment, and then nodded.

'Aunt Clemmy will do de missy hair,' she answered slowly. 'I come down at de time, Isaac.'

Isaac laughed again. 'Perhaps,' he said, 'I don't can get away so early, me fren', from de political meetin'—dar is political meetin' to-morrow ebenin' down at Delgado's; but anyhow, you wait till ten o'clock. Sooner or later, I is sure to come dar.'

Rosina gave him her hand reluctantly, and glided away back to the house in a stealthy fashion. As soon as she was gone, Pourtales flung his head back in a wild paroxysm of savage laughter. 'Ho, ho, ho!' he cried. 'De missy, de missy! Ha, ha, I get Rosina on ob de road anyhow. Him don't gwine to tell nuffin now, an' him clean off de scent ob de fun altogether to-morrow ebenin'!'

STATION No. 4.

STANDING at the corner of two unimportant streets, in Philadelphia, U.S., and having no external features to distinguish it from the numberless stables and coach-houses in its vicinity, except the words 'Station No. 4' painted in large black letters on its gray door, its unpretentious exterior gives no hint of the marvels to be found within. Yet, for all its modesty and seeming indifference to appearances, Station No. 4 is no whit behind its more elaborate fellow-stations in matters of organisation and interior economy, down to the minutest details of drill and machinery; and the fine stalwart lads, whose acquaintance we are about to make, have shown their pluck and training in many of the most destructive fires which from time to time have ravaged the Quaker City.

As is usual in America, no order or official introduction is requisite to insure sightseers a welcome and the fullest explanation of everything of interest; nor is the application of the 'silver key' expected; while the mere fact that the visitor is a foreigner, and more especially if he prove to be an Englishman, is sufficient to secure him a hospitable reception and a more than ordinarily courteous escort. Our rap on the door-panel is instantly followed by the appearance of a sturdy, good-looking young fellow in a plain uniform of dark-blue cloth, under whose guidance we are soon deep in the mysteries "of electric signalling, self-adjusting harness, and all the thousand-and-one ingenious contrivances for time-saving, which have long since made the American fire-brigades the most efficient in the world.

We find ourselves in a long narrow building, some forty or fifty feet in length, and ten or twelve in width. On one side is a staircase leading to the upper floors; on the other, a narrow gangway, kept clear of encumbrances, runs from end to end of the building. A wide doorway, like that of a coach-house, opens upon the main street; and at the farther end, facing the doorway, are three stalls, in each of which stands a horse, wearing a blind-halter, but otherwise unencumbered, and not attached in any

way to the stall. A single line of rails is laid in the floor from end to end, on which rest the wheels of the engine and hosecart; for, unlike our English machines, the engine does not carry either the hose itself or the men who work it, a separate two-wheeled vehicle, something of the build of a small wagonette, being employed for this purpose. This hosecart stands in front of the engine, and carries, besides the long coil of tube, all the appliances, such as axes, ropes, &c., which are likely to be needed at a fire; and a couple of the portable chemical engines, known as *Extincteurs*, packed away in boxes beneath the seats. Both engine and hosecart are furnished with large clear-toned bells, and it is the duty of one of the men to keep these bells ringing during the whole journey to a fire, as a warning to all other traffic to leave the car-tracks in the centre of the street clear for the passage of the engine. The clamour of these bells, as, in the dead of night, engine after engine rushes at full gallop through the streets, is one of the most impressive accompaniments of a great fire, and is a far more effectual means of clearing a crowded thoroughfare than the shouts of the firemen, so familiar to a Londoner's ears.

Having exhausted the hosecart, and shown how carefully all its equipments are packed so as to combine the minimum of space with the maximum of availability, our guide passes on to the engine itself, for which he seems to entertain as much affectionate pride as if it were a living pet. It stands immediately behind the hosecart, allowing a space of about three feet between the end of its pole and the back of the cart. The driving-seat is very high, and gives room for one man beside the driver, all the rest of the force having their allotted seats in the cart. The engine itself, a powerful steamer, is as handsome an object as bright paint and brilliantly polished metal can make it; and no one, judging from its spick-and-span appearance, would credit it with the yeoman service it has done in many a conflagration. Beneath the boiler, the fire is already laid, with wood soaked in coal-oil and a substratum of highly inflammable 'kindling,' ready to spring into a blaze on the smallest conceivable provocation. The boiler is connected by a tube with a large stationary boiler in the cellar beneath, and a constant supply of hot water passes from the latter to the former. This tube being automatically severed from the engine the instant an alarm is sounded, and the engine-fire kindled at the same moment, a sufficient pressure of steam for the pumps is generated long before the scene of the fire is reached, and so again valuable time is saved.

Our attention is next drawn to the harness, which is suspended from the ceiling exactly over the places occupied by the horses when attached to the engine and cart. Great ingenuity is displayed both in the construction of each part of the trappings and in the mathematical accuracy with which it adjusts itself to the exact spot of the horse's anatomy which it is intended to occupy. The collars are of iron, hinged at the topmost point, and having a clasp like that of a lady's bracelet to close them beneath the horse's neck. When hanging, they are open to

their full extent; and as they descend upon the horse, they close and snap by their own weight. The polechains are attached by spring snaps to the collars, and this is the only part of the harnessing which has to be done by hand after the alarm sounds. The entire harness for each vehicle is suspended by a single cord, which merely requires a touch of the driver's hand, when he reaches his seat, to adjust and liberate the whole.

Against the wall, close by the door, and well in view from the foot of the staircase, are a large gong, a clock, and a glass-covered dial, the last bearing the numbers which indicate all the sections into which the city is divided for the purposes of the brigade. At the further end of the building, as already mentioned, are the horses, clever, well-trained, cervicible-looking animals, of which our guide has much to say, his anecdotes and manner of speaking of them showing that they are as great favourites with the brigade as their engine itself. The big sturdy fellow on our right, as we stand facing them in their stalls, does duty between the shafts of the hosecart; the others, a well-matched pair so far as size and strength go, belonging to the engine.

As yet, our cicerone is the only member of the force whom we have seen, the rest being 'off duty,' and spending their leisure hours in the comfortable reading-room on the first floor. But now our guide disappears for a moment, and presently returns with an older man, whom he introduces as the superintendent of the station. The latter, after a few minutes' chat, in the course of which we manage to pay one or two well-merited compliments to the American system, volunteers to indulge us with a private view of the working of the station. Placing us so as to insure fair-play to the men and horses, and assuring us that no one in the building but ourselves is in the secret of his intention, he approaches the gong, and touches a spring which sets the electric current working. The transformation is instantaneous. The gong sounds sharply; the doors of the stalls fly open; a whip-lash, suspended like the sword of Damocles over the hosecart horse's flanks, descends sharply, and sends him off down the narrow gangway at a swinging trot. His companions follow, and range themselves in place on either side of the engine-pole. The harness falls into place obedient to the touch of the driver, who, with the rest of the men, has glided from the floor above, and has already swung himself to his seat. Two others clasp the chains to the collars; and in another instant each stands ready to mount to his place in the cart the moment the word is given to start. Glancing at our watches, we see that the whole time since the first stroke of the gong is exactly *eight seconds*—an almost incredible illustration of what can be done by perfect organisation and careful drilling.

The private rehearsal being now at an end, the reverse process follows, with scarcely less despatch and mechanical regularity; and almost before we have realised the completeness of the preparations, the horses are once more in their stalls, the men have returned to their occupations above-stairs, and the usual orderly aspect of things is restored, *within one minute* from the

sounding of the alarm. The superintendent is well pleased with the admiration and applause his little performance elicits, and now proceeds to point out one or two minor details which had escaped our notice. He shows that the clock has stopped—registering the exact moment at which the call sounded—explains the machinery by which the electric current throws open the doors of the building and of the horses' stalls—points out how the precise locality of the fire is shown by the number of beats on the gong and by the numbered dial; how the tube which supplies hot water to the boiler has been closed and disconnected; and finally, conducting us upstairs to the dormitory, how the gas in the chandelier is turned on and ignited by an electric spark, so as to avoid delay in case of a night-alarm.

And so at length, rather exhausted by than having exhausted the wonders of the place, we bid our friendly guide 'good-day,' and once more find ourselves in the street. Station No. 4 has resumed its unpretentious aspect, and as we turn away, we can hardly credit that commonplace exterior with such marvellous contents. It is as if we had been admitted for a brief space to the Palace of Enchantments of some fairy tale or Arabian Nights' story, and it is difficult to realise that we have only been behind the scenes of one of the hardest-worked departments of a nineteenth-century police.

Each Company is responsible only for attendance upon calls within certain fixed limits, except in the case of a general call. But as every summons rings in every station, the organisation is kept in perfect order by the frequency of the alarms. In connection with the fire brigade there is also a Patrol or Salvage Corps, whose quarters are similarly equipped in all respects; while the arrangements for the comfort and recreation of the staff are rather better, and the number of hands employed considerably larger than in the individual stations. The importance of efficiency in both departments may be judged from the fact that, as our guide informed us, the calls to actual fires, upon Station No. 4, average about twenty per month during the long winter season.

WHERE THE TRACKS LED TO.

IN FOUR CHAPTERS.—CHAP. II.

THE very next day the office porter at Thurles & Company—I never heard who the 'Company' was—received orders to go to Bristol on some errand for the firm, and wait for a packet, which he was to bring back with him. Thurles & Company had two out-of-door porters or messengers; but this was the man who attended to the head-clerk's room, to the counting-house, and, of course, on Mr Thurles. He went, and I suppose his employers had written to the Bristol people asking them to keep the man down there for a while, as he was gone a very long time. In his absence, another person had to be appointed to perform his duties; and I may as well say at once that I was the temporary porter, and that the regular party had been purposely sent away to make room for me. Dressed in plain

brown livery, with brass buttons, wearing a false pair of whiskers—I shaved quite close in those days—with collar and tie as much unlike my usual style as could be, without anything like a caricature, I was not easily to be recognised, even if—as was hardly probable—some of the clerks had ever seen and known Sergeant Holdrey of the metropolitan police. There were not many clerks at Thurles & Company's, so on the first day of my taking office I knew them all.

My inexperience in my duties occasioned me, and others too, some inconvenience at first, and would have been much worse but for a little assistance I derived from a clerk who observed it—a young fellow named Picknell. I had noticed him when I first went in, and did not like his looks. He was short and thin, very dark-complexioned like a gipsy, with eyes that you couldn't fix, and couldn't say whether they were watching you or not; and I never could make up my mind from first to last as to whether he had or had not a cast in his eye. However, he took compassion on me, and told me several things which were useful, and from the first seemed to take an interest in me. Well, on this day I could do but little. I kept my eyes open; noticed the manner and style of the clerks, and of the porters as well. These latter had not been suspected; but they were none the less likely to have been in the job, and of course I noticed thoroughly the window and its position as regarded the safe.

Mr Thurles had said the robbery must have been committed by some one whose appearance was familiar to the people in the neighbourhood, as he would certainly be noticed; but after seeing the premises, I did not agree with him. The entry was made in just the way a regular 'tradesman' would have done it; but this was no guide, if the place had been prepared for him.

I went home to think over the matter and to decide what my first move should be. I was going round a crescent which lay in my road home, when I was startled by seeing two figures cross the farther end, and, as they passed under the light of a lamp, I could have sworn that one was my Winny; the other was a man I could not recognise. I laughed at the fancy, however, as it was impossible that my girl should be there; and I had turned down a street which led to my place, when, by a sudden change of mind, I turned sharply round and went in the direction where I had seen these persons. But just there the crescent joined a large and busy thoroughfare, in which it was easy to lose any one; at any rate, I could see nothing of them, although I walked first on one side and then the other for several minutes. Once I thought I saw a couple resembling them enter a shop, and I hurried up, only to find, when close to them, that these were not in the least like the persons I thought I had seen.

This incident disturbed me more than I could account for, and do what I would, I could not help thinking of it all the way home; and as I put my key in the door, my heart fluttered in such a way as it had never done with more serious business. It was an immense relief to me to find Winny there and my tea waiting for me as usual.

'What has been troubling you, father?' she

said, as I took off my hat and coat. 'You look harassed.'

'Well, I am a little harassed, Winny. I don't like being taken from home again.' I had determined to say nothing about the crescent incident, of which I began to feel a trifle ashamed.

I made up my mind to have a nice enjoyable Christmas, for the business of Thurles & Company was not of the kind to demand my running about without rest, and, in honest truth, I did not see how I was to begin anywhere, so a day's consideration would not hurt it.

We had a quiet day enough. My wife's brother and his wife came to tea and supper; as also did Dick Berry, an old comrade—peu-soué off like myself—and his wife. We had a cosy evening; but Winny and I had our dinner alone. When it was over and I got my pipe, I could not help thinking of very different times—when my poor wife was alive—always so cheerful!—when the two boys, who died with the scarlet fever, were still with us, and when Tom, my other boy, had not gone to Australia. While I was thinking like this, I caught Winny's eye fixed on my own, and I supposed something of the same train of fancy was in her mind, for she rose from her chair, threw her arms round my neck, and—to my alarm, as well as my surprise, for she was not a girl to give way—burst into sobbing.

I was upset for the moment; but rallying, I said: 'Come, Winny, my dear! We must keep up a better heart than this. I know you are thinking of the past; but I would rather you, with all your life before you, thought of the future.'

For the moment she was worse instead of better for this cheering up, and I really thought was going to be hysterical; but she rallied herself with a great effort, and after kissing me again and again, dried her eyes, and laughed at herself for being so foolish.

We had no fresh outbreak; but, for all that, I was glad when my friends dropped in and things became more generally cheerful. We had our usual chat, our game at cards; although Winny was a woman grown, she always looked for the 'speculation' at Christmas, just as she had done when a child. We had our songs too; but over these, I gave my old friend Dick, who was a beautiful singer—had been better, I know, but was capital still—a hint not to make the ballads too sentimental, consequently he left out *Tale of Beauty*, which was his great favourite, and worth walking a mile to listen to. So the evening passed off pretty well.

On the next day I was at Mr Thurles' office again. Being Boxing Day, there was only one clerk there. It was necessary, it appeared, to keep the office open; but no particular business was expected to be done. The clerk on duty was the young man Picknell. He was as pleasant as before, and quite disposed to make the time pass agreeably, so that the loss of my holiday should not be so bad after all. He sent out for a bottle of wine, as on such a day, he said, no one ever came after the morning; and being, it seemed, of an abstemious turn, he meant it all, or nearly all, for me. Now, that was kind of him; but, as it happens, I am abstemious also, and do not care for anything in that way until the evening. However, to show that I

appreciated his kindness, I drank a glass or two. Also—it was a waste of good liquor, I own—I threw a little under the grate while he was out of the room. I wanted to please him, and at the same time to keep my head clear.

To keep up the idea that I was enjoying myself, I allowed my tongue to run somewhat more than usual. He was by no means displeased at this, but rather encouraged it. I was at a loss how to introduce the robbery. I wanted to get at the gossip and opinion of the office on the subject; but it was a ticklish matter to begin upon, when the difficulty was solved by Mr Picknell mentioning it. Mr Thurles had told me that only a few of his people knew all the facts of the burglary; but if he thought such a thing was possible, I did not, and would have betted that every man in the concern knew quite as much about it as did his master.

‘Through the window under which you are sitting, David,’ said Mr Picknell—I was ‘David’ as the new porter—‘some thieves broke into the office a little time back. We had a most mysterious robbery here.’

‘Then that must have been what I heard two of the gentlemen talking about the other day,’ I answered. ‘Did you lose much, sir?’

‘I believe not a great deal,’ continued the clerk; ‘and why such expert burglars as these must have been, should not have arranged for a greater haul, no one can guess.’ He went on to tell me, very clearly, how all was supposed to have been done, and in telling me this, he mentioned Mr Godfrey’s name. He showed me where the young man sat, and explained his duties. He touched only slightly upon these things; yet it was quite clear from what he said that no one had such facilities for knowing what was in the safe as Mr Harleston, and no one could so easily have taken a cast of the keys. He did not say this right out, yet he contrived to impress it all upon me as clearly as though he had put it down in writing.

I was easily led, you may suppose, to talk upon this subject, and he led me on accordingly. But, of course, if you lead a man anywhere, you have to go first along the same path, hence, naturally, he had to dwell upon the matter just as much as I did. Having learned so much, I wanted to hear more about Mr Godfrey.

‘Why does not the young gentleman come here now?’ I asked. ‘I understood he was engaged in the office.’

‘So he was,’ returned the clerk with a queer smile; ‘but things are not pleasant just now.’

‘I should have thought Mr Thurles would have liked some confidential person in his establishment,’ I continued; ‘it would be very convenient.’

‘Perhaps he would,’ said Picknell, with another smile; ‘but sometimes confidential persons know too much, and then, you see’—He broke off here, but of course I understood his hint.

Well, the day wore away pleasantly, after a fashion, and I strove to see something like the ghost of a clue in what little I had already gathered. It certainly looked rather suspicious as against Mr Godfrey, and I resolved to pay some attention to him and his associates. And then there were other things to be thought of, because I am not one of those men who, having

taken up an idea, try to make everything fit in with that, instead of making my ideas fit the facts.

The first thing now to be done was to ascertain what expenses young Mr Godfrey was running into and what companions he mixed with. It was certain that it was not he who had paid in the forged hills; and as those were lost, a good deal of the regular way of proceeding was of no avail. Here, too, a hint or two from Mr Picknell came in useful. It appeared that the young fellow had a great taste for horseracing—or for betting on horseracing, which is not altogether the same thing. This was important, and so were several other scraps of information I picked up from the clerk.

In the little time that I was at home, I was sorry to see that Winny was not yet her old self; and I determined that as soon as this business was over, winter-time though it might be, she should take a holiday, and we would go to some sheltered place on the south coast for a fortnight, as I feared she was working too hard.

I now learned that Mr Harleston was supposed to be entangled with some disreputable female acquaintance. Mr Picknell let this fall as though by accident. I did not greatly believe in the accidental character of the information, for I had soon decided that the clerk did not like Mr Harleston; nevertheless, such news was valuable, as my experience had long taught me that such an entanglement was enough to account for anything.

I had not seen Mr Godfrey. This was indispensable, so I resolved on a bold stroke, and determined to call at the house of Mrs Thurles with some excuse, to ask for him. Well dressed up, I thought I was safe; and luck befriended me. I had got up a clumsy story: it was to the effect that I heard they were taking on people at Thurles & Company, and I had been recommended to apply to him. It was absurd enough, I know, to go to a gentleman in the evening on such an errand; but in my case it did not matter, as the stroke of luck I referred to saved me all trouble. I was opposite the house, at the foot of the steps, turning over the beginning of the story in my mind for the last time, when the door opened and a servant looked out. Seeing me, by the light of the street-lamp, he beckoned and said: ‘Do you want to earn a shilling, my man?’ I said ‘Yes’ promptly enough, and went up the steps; while the man, turning to a gentleman whom I now saw in the hall, said: ‘Here is one who will go, Mr Godfrey.’ The very chance! A tall, fine, handsome young fellow, but without that air of resolution I like to see in a man’s eyes and mouth. ‘A good enough fellow you are,’ I thought; ‘but could easily be made a tool of by man or woman either.’

It appeared he had an appointment with a gentleman, but being detained at home, would be an hour behind time; and to send word to this effect was why he wanted a messenger. Mr Godfrey was man of business sufficient to make sure of my doing my errand properly, by adding a line to say I was to have a shilling on my giving the note in. He told me this with a smile. As nothing particular came of

the message, I will merely say that I delivered it promptly and got my money.

Now I had seen Mr Godfrey, I should not forget him easily. But what struck me as strange was the feeling that I had seen him before. Of course one may meet anybody, casually pass him in the street, and so forth, retaining a vague recollection of his features; but this was not altogether like that. I seemed to have some recent knowledge of him, but where, or how, I racked my brains in vain to find out.

My plan was to watch Mr Godfrey. I had learned, I considered, all I could at the office; the only thing to be done now was to find out more concerning his habits and associates; therefore I gave up the porter's livery next day. To do this was not difficult, as one of the out-door men was ordered to take my duty until the return of the regular official.

I felt in duty bound to return Mr Picknell's liberality, and to ask him to have a glass with me at my expense; but I would not do this before the other clerks, as the young man might not like it; consequently, I waited until the men had left, and then, lingering outside for Mr Picknell, I intended to speak to him when a little way from the office. As I knew where he lived, I took up a position accordingly; but he turned in an unexpected direction, and went quickly away from me. This might easily happen from his having a special engagement; but there was something in the manner of his crossing the road, and then hurrying down a bystreet, which looked like a man endeavouring to escape notice; and I made up my mind to follow and watch, instead of speaking to him. It was not easy to keep him in sight, so quickly did he go, and so suddenly did he turn down unexpected streets, but I managed pretty well, until I found, much to my astonishment, that we were drawing near the neighbourhood in which I had earned my shilling on the previous evening, and, in fact, were close to the house of Mr Godfrey Harleston.

It was surely impossible that he could be going there; but he kept on until we were almost in the street, when he entered a low-looking public-house which stood in a mews close by. I waited, hidden in a neighbouring doorway, to see him come out. A long time passed; and as he did not appear, I began to grow uneasy. At last I went into the house, and found, to my disgust, that it opened on the other side into a bystreet near the mews, and by this way, no doubt, Mr Picknell had gone. This was surprise enough; but to add to my astonishment, I saw, leaning against the bar, smoking, and with a half-emptied tumbler before him, Sam Brucey, the Long-necked Sam whom I had saved at the Old Bailey. I knew him at once, and the recognition was mutual. Sam had nothing to fear from me now, but I could tell that he was rather staggered by seeing me. Of course I could not consider him as being after any good, see him where I might, and he knew that as well as I did. He touched his cap, and asked to be allowed the pleasure of standing a glass. When I declined this, he said he had been to the West End on a profitable bit of business—indeed, he thought he was going to take a snug little beerhouse there, which a

friend had promised to put him into. I looked at him steadily while he said this, and smiled when he had finished. In spite of himself, Sam could not help smiling also, although he tried to disguise it by drinking some gin-and-water.

AN ANCIENT SPINNER.

IN the 'good old days' before the invention of the spinning-jenny and the steam-engine, when working-men were slaves, and the rich had not the luxuries they have now, spinning was the work of the mistresses of the house. Many good stories begin with an account of a fair maiden at a spinning-wheel, and a very ancient rhyme refers to the days 'when Adam delved and Eve span.' When a young lady was growing of a marriageable age, in the days of the spinning-wheel, she made preparation for her nuptials by spinning the material for sheets, tablecloths, napkins, and all manner of household necessities; hence she was called a 'spinster.'

Words change in their meanings with the changing fashions of a changeful world. There is one class of spinners, however, to which the whirl of the loom and the steam-engine has made but little difference. 'Men may come, and men may go, but they go on for ever.' All the changes of our complex civilisation make but little difference to these little spinners. They live in their dark little houses; spin their threads; live their lives; die in peace, or else get eaten up, and pass off the scene, making no fuss, seeking no honour. Some people call them mussels; scientific naturalists call them *Mytilus edulis*. They deserve a good name, for they are an ancient and honourable family; that have fought a good fight in the fierce battle of life, and have endured through long ages, while many others have perished.

Every one who has visited the seashore must have noticed at times a little mussel forming the centre of a tangled mass of threads, shells, stones, and all sorts of fragments. These are bound together by the labour of the black-shelled spinster. Instead of anchoring to a rock, as a well-behaved little mussel ought to have done, this one has gone off and anchored to all sorts of rubbish, and been driven and tossed by the waves of the sea in all directions, until it has formed the centre of the tangled mass we find on the beach. In the natural way, a mussel settles between high and low water mark. When covered by the tide, he opens his doors, and angles for a living with his wonderful fishing-apparatus, for the spinsters of the sea are all born fishermen. When the tide is going out, the little angler closes the valves of his house as tight as a steel safe, and keeps his mouth shut, with a lot of water inside, until the tide covers him again.

How the Frenchmen have learned the habits of this well-known little spinner, and cultivated him, and made of him a cheap and nutritious article of diet for the French nation, is fairly well known. How the little fellow builds his house and weaves his ropes, is not quite so well known. The house itself, with its black outside, and the beautiful sky-blue, pearly inside, is a work of the greatest skill, while the mechanism by which it is opened and closed forms a chapter

in the world's wonder-lore. The little spinner lives in a soft, fleshy 'mantle,' inside of his stony house. On the edges of this mantle are tiny fingers (*cilia*) and little pigment cells with which he builds. The material—carbonate of lime—is extracted from the clear sea-water by a simple process in the life of the animal. Just as our food goes to form blood and bone, muscle and sinew, so does the food of this little spinner go to form his delicate tissues and his hard shelly house. The mussel-house is as much a part of the mussel's life as our homes are part of our lives, and the processes of building are not so very different either; both are simple, both are mysterious.

To watch this little spinner make his thread is very interesting. From one side of his house protrudes a curious little pad of flesh, a quaint, pointed sort of a tab. This is called his 'foot,' though it might just as well have been called his hand. He touches the rock, or whatever he desires to attach himself to, with this foot, then withdraws it, leaving a tiny thread, which he has made by some mystic process, in his own body, just as a spider makes her silken cord. The foot comes out again and again, always leaving a thread, until a strong rope is woven, which binds him securely to his chosen home. He can shorten or lengthen this cable by a simple contractile motion, which allows him a little play; but he may be said to be fixed for life, once he settles down. After a severe storm, some of them will generally be found on the shore, driven from their moorings, helpless and homeless on the strand; but they can stand the storm as well as the ships of more skilful people, and their disasters at sea are probably less numerous in proportion than ours are.

I had one little fellow in an aquarium, who had been gathered from a spot where the tide left him for a long period every day. He did not care to be under water all the time, so, by the aid of his foot and his wonderful home-made thread, he climbed up the glass to the surface of the water. There he attached some threads above water to the glass, leaving some below. When the little spinner felt like having a breath of fresh air, he 'hailed in' on his upper guys, and rose above the surface. When tired of that, he 'slacked off,' and took a turn underneath, thus making something like his accustomed tidal habit.

Watching these little animals in their daily movements, one grows to have a fellow-feeling for them. Some of their actions seem almost human, and they form a part of the household, just as the cat, the dog, or the canary. One day a conscienceless sea-pirate known as a dog-whelk settled on this little spinner, and began to bore through his shell with murderous intent. The whelk was taken off, and removed to another part of the aquarium. On the morrow, he had found his way back and settled down again on the innocent little victim, so he was sentenced to death as a murderer, and paid the penalty with his life.

This mussel has inherited the spinning business from a long line of ancestors; for when the coal-forests bloomed where the iron furnaces now roar, in the 'Black Country' of England, the forefathers of our little spinner were inhabitants

of the fresh-water pools in the carboniferous forests. Ages have come and gone since then; the stony remainders of the ancient spinners are dug from out the deepest coal-mines, but the clever little fellows still spin their simple threads along our shores as of old. We sometimes weave their threads into gloves and hose, as a matter of curiosity; but few ever seem to have time to listen to the wonderful story that can be told to listening ears by this Ancient Spinner.

AN ESCORT ADVENTURE.

'SERGEANT, you have been detailed to proceed on escort with the prisoner Scales. I would advise you to keep a sharp eye upon him. He is a desperate character, and if he gets half a chance, will endeavour to give you the slip,' remarked our adjutant to me.

'Very good, sir,' I replied.

'Here is your paper,' said the officer, as he handed me the warrant which bound me, under severe penalties for non-fulfilment of its provisions, to take private Jeremiah Scales 'dead or alive' to the district military prison.

I saluted the adjutant, and was turning to leave, when the colonel entered the orderly-room.

'Good-morning, colonel,' said the adjutant. 'This sergeant is going on Scales's escort, and I was just warning him to take great care of the rascal.'

'Confound the fellow!' grumbled the colonel. 'After all, it seems the scoundrel is coming back to me. The court-martial that tried him—very properly, considering his antecedents—sentenced him to be discharged on the expiry of his term of imprisonment; and now the general, presumably acting on superior instructions, remits the only part of the punishment that is likely to benefit the service. During my twenty years' experience, I have always found it the same in the army. Last spring, for instance, during the wholesale reduction that took place, we had, perforce, to send away a number of good men, infinitely better than this blackguard. Now, the Franco-Prussian business comes on the boards, and the authorities at the Horse Guards are moving creation to obtain recruits in order to get the regiments up to full strength. Every broken-down scarecrow in the kingdom is being enlisted, at least if I may judge from the precious specimens sent up to me. Besides, the recommendations of courts-martial with regard to the discharge with ignominy of the scum of the army are not being given effect to, and the rascals are allowed to remain in the service.'

Yes, sergeant,' resumed the commanding officer, addressing me, 'you've got a cut-throat incorrigible blackguard to deal with; and if you don't look out, he'll give you some trouble.'

I then saluted the officers, and leaving the orderly-room, retired to my quarters to make a few preparations for my journey, which was a tramp of about eight miles along the seacoast. These finished, I proceeded to the room of the private who was detailed to accompany me, in order to have a consultation with him on the subject. This man, a Welshman, named Williams, was a veteran whose period of service had almost expired. He was, speaking literally, the 'hero

of a hundred fights; his experience of active service beginning while a boy in the second Sikh war. He subsequently was engaged in Kaffirland, the Crimea, and in India during the suppression of the Mutiny, finishing with the Abyssinian expedition, which took place two years prior to the time of which I write.

I narrated to Williams the remarks of the colonel and the adjutant regarding our prisoner; but the veteran affected to treat the matter very lightly. 'I've had "tougher jobs than this in my time, sergeant," he said; and then added significantly, pointing to his Snider: 'Just let him try to hold, and my word, he won't get very far!'

The prisoner, Scales, was a repulsive-looking fellow of about twenty-five. He was more a lithe and active than a powerful man, but was nevertheless, by reason of his brutal and vindictive disposition, the terror of all the peaceably disposed men of the corps. He had served in the army for about three years, during which period he was always in trouble. On the return of the regiment from abroad, he came to us from the dépôt with an extremely bad character; and this evil reputation he afterwards consistently maintained. At the reduction of the army referred to in the colonel's remarks, the services of Mr Scales would to a certainty have been dispensed with had he not at the time been a deserter. Being apprehended and brought back to the corps at the beginning of the scare occasioned by the disturbed relations of Prussia and France, he received two months' imprisonment, and was sent to his duty. Three days after his release, an officer's room was broken into and all his valuables abstracted; and in this business it was supposed Scales was implicated conjointly with a comrade of equally bad repute. This private deserted with the booty, and Scales was apprehended on suspicion and handed over to the civil authorities; but he was liberated owing to no sufficient evidence being forthcoming to warrant his being sent to trial on the charge. His next feat was striking a non-commissioned officer, and for this offence he was now sentenced to nine months' imprisonment; the further recommendation by the court-martial for his dismissal from the service with ignominy being remitted by the general commanding the district.

No wonder that our worthy colonel was indignant at the prospect of having such a character sent back to the regiment! Blackguards of his description, in regard to the relations of soldiers with civilians, invariably bring the regiments which have the misfortune to own them into general discredit. The great majority of soldiers are respectable and well-conducted men, and to such it is very gallant and annoying to be subjected to a social ostracism as rigid, in some cases, as that experienced by a time-expired convict, because of the excesses committed by a disreputable minority of their number; the civil community being addicted to the belief that all who wear the red coat are had alike. It is to be regretted that the commanding officer of a regiment has not the power of summarily dispensing with the services of an incorrigible ruffian by having him kicked out of the barrack gate.

In the afternoon, Williams and I, equipped

in marching order, and provided each with ten rounds of ammunition and a day's rations, made our appearance at the regimental guardroom. The sergeant of the guard gave me a word of caution, and informed me that Scales had been boasting to the men that he meant to make his escape.

Our man received us with a stolid look, and mechanically held out his wrists for the reception of the handcuffs; and after a word of farewell to the other prisoners, he took his place beside the private, who had his hayonet fixed. I then marched them out of barracks into the principal street of the town. Perceiving a man of my own regiment who was engaged on garrison police duty, I asked him to accompany us to the outskirts, in case the prisoner took a fancy to bolt down one of the numerous tortuous alleys that led to the wharfs near the pier. Having reached the limits of his beat, the private returned, and I was congratulating myself on having nearly reached the open country, in which Scales would run a poor chance of escaping from our custody, when we were met by a large drove of oxen. In spite of the exertions of the drovers, the cattle passed on either side of us, and Scales, lund-cuffed though he was, watching his opportunity, suddenly sprang aside, and dodging among the animals, gained the footpath, and ran townwards with the fleetness of a hare. Disengaging ourselves as quickly as possible from the cattle, we started in pursuit; but as we were encumbered with our rifles and knapsacks, we made but little headway, only managing to keep the fugitive in sight. We shouted to a few rustics to intercept him; but the yokels perceiving that it was only a soldier running away from an escort, greeted him instead with cries of encouragement. Suddenly, to my delight, a policeman appeared ahead, who spread out his arms and tried to catch the runaway; but Scales, dropping his head, butted him like a ram, and knocking over the guardian of the peace, turned to his right, and disappeared down a lane a little distance ahead. This lane led into a yard, which was situated at the back of a row of warehouses, and which was a *cul de sac*. Reinforced by the policeman, we followed close on the heels of the fugitive, feeling certain that as there were no means of exit, we would speedily capture him. Meeting at the entrance to the yard a drayman with his vehicle loaded with barrels, we eagerly asked him if he had seen a soldier.

'Yes,' the fellow replied with a grin; 'I guess you will find him in the farthest cellar.'

We hastened in the direction indicated, but found, to our dismay, that the cellar door was securely padlocked, while the rusty condition of the hasp showed that it could not recently have been opened. The high wall that bounded the other side of the yard precluded the idea of the prisoner being able to scale it; so we stood for a moment, out of breath with excitement and our recent chase, perfectly perplexed with Scales' unaccountable disappearance. Williams at this juncture began ominously to untie his packet of cartridges, and placed them loose in his hall-hag ready for use, in the eventuality of the fugitive, should we come across him, declining to surrender when ordered. Knowing the determined character of my comrade, I knew that Scales's life,

if he proved obdurate, would not be worth a pin's fee. (In the days of the muzzle-loader, it was customary, I may mention, to carry loaded rifles while escorting prisoners; but since the introduction of the breech-loader, the practice has been discontinued.)

We searched the yard thoroughly, but found no signs of our man. All the cellar doors, like the first we examined, were closed. The warehouses referred to were principally used for the storage of grain; but owing to the war in progress, trade was interrupted with the Prussian towns in the Baltic, and little business being transacted, the buildings had in consequence been shut up. At last a light seemed to break upon the policeman, who exclaimed: 'I'm blessed, sergeant, if I don't think the cove wasn't stowed in one of the dryman's barrels!'

This idea seemed to explain Scates's mysterious disappearance; so we started in the direction of the main road, and turning towards the town, found the dryman unloading barrels at the door of a public-house. The man, with volleys of the choicest Billingsgate, stoutly denied that he had afforded shelter to the fugitive; so, perceiving that it was useless wasting words on him, we again pursued our search, scarcely knowing in which direction to turn. Pursuant to my request, the constable proceeded to the police office to report the matter, in order to have the other members of the force put on the alert.

I was now in a terrible quandary. Trial by court-martial and reduction to the ranks, together with a possible sentence of imprisonment, for allowing the man to escape, stared me in the face; while imprisonment for Williams was a certainty. My chances of advancement in the service would be absolutely ruined, I reflected, if I did not recapture the man, so I resolved, when I had so much at stake, to continue the search, although I looked for him all night. It was no use hunting for Scates in the principal streets of the town, as these were patrolled by military police, intent on apprehending soldiers who showed the slightest symptom of having had an extra allowance of liquor; besides being ruthlessly down on delinquents who had a tunic button undone, or the chin strap not adjusted in the regulation position.

While I was mentally shaping out a course of action, my companion stopped and excitedly exclaimed: 'I have it now, sergeant! I'll bet ten to one he's gone to old Nathan's!'

'I'm not sure of that,' I remarked dubiously; 'but at all events we'll go and see.'

Nathan was a rascally old Jew, who, though he was rigorously kept out of harracks, carried on with the soldiers a brisk business in the sale of coarse, rank, contraband tobacco. He had 'agents' in the different regiments to further this branch of commerce; and one of his accredited representatives in ours was private Scates. Besides, the old rascal, although it had never been brought home to him, was suspected of purchasing articles of 'kit' from ne'er-do-wells, and supplying ragged plain clothes to deserters in exchange for their uniforms. We lost no time in making our way to the squalid alley in the slums near the harbour where the business establishment of Mr Nathan was located; and when we reached the Jew's dirty little huckster's shop,

we found him weighing out a small quantity of a condiment resembling toffee to a couple of grimy children. Pausing until the juvenile customers had left the shop, I asked Nathan whether that afternoon he had received a visit from Mr Scates.

'No, sergeant; no soldier hash been here,' replied the Jew, who then continued in an undertone: 'Can I do hishness wit yon in some good tobacco?'

I paid no heed to the old Israelite's statement, and decided to inspect the premises myself, without any scruples as to the legality of that course of action. Placing Williams at the door with instructions to allow no one to pass in or out, I proceeded, in spite of the expostulations of Nathan and his threats to call the police, to carefully search the little back-room behind the shop. No one was there; so I ascended a rickety staircase, and finding the door at the top locked, I kicked it open; but the foul-smelling apartment, into which the door led was plunged in utter darkness. Returning to the shop, I helped myself *sans cérémonie* to one of a bunch of candles, and lighting it, returned to the upper room, which, on examination, proved to be a storehouse for the rags and bones in which the Jew dealt largely. I opened the shutters of the dirt-encrusted diamond-paned window, and probed with my gun-barrel every heap of rags; but, to my disappointment, the fugitive was not concealed in them. Suddenly, I perceived some glittering particles on the floor, which, on stooping to examine, I found to be bright iron filings! I was now filled with a feeling of exultation. Scates had apparently been to the Jew's, and thus relieved of his handcuffs.

I once more examined the room. The window was apparently a fixture, and no one could make his exit without removing the sash. I next surveyed the roof, and perceived a trap-door giving access to the attics just large enough to allow a man to enter it. 'My man is there right enough,' I exclaimed to myself in great glee. I then shouted through the aperture: 'I know you are there, Scates; it will be better for you if you come down at once.' There was no response; so I decided to have the region explored. I called to Williams to keep a lookout for a policeman, and almost immediately my comrade shouted to me that he had secured the services of a constable. I thereupon summoned Williams to my assistance, leaving the Jew in charge of the policeman. Placing the rickety table under the trap, Williams speedily crawled through and gained the attic. Knowing the desperate character we had to deal with, I considered it expedient that my comrade should be prepared for an encounter; so I unfixed his bayonet, and handed it to him together with the lighted candle. Crawling over the creaking joists in the direction of the gable in which the window was fixed, Williams made a careful examination of the interior, while in the room below I waited with breathless excitement.

'Anybody there?' I cried.
'One moment; I haven't had time to see,' Williams replied; and then began to search the opposite end. 'Come out of that, you rascal!' he at length indignantly shouted. 'I've got him, sergeant; he's stowed in a corner!'

I then heard the fellow hiss out: 'I've got a knife, and if you come near me, I'll cut your throat, if I have to swing for it!'

Fearful of exposing my comrade to the peril of a hand-to-hand tussle with such a ruffian in the circumscribed area of the attic, I called Williams to the trap-door, and placing a cartridge in my Snider, I handed it to him. Then mounting the table, I thrust my head through the trap and held the candle. My blood was now up, and I determined to order the rascal to be shot if he refused to obey my commands.

'Surrender, in the Queen's name!' I shouted.

There was no response; but the click of the lock of Williams's rifle as he placed the hammer at full cock, must have been distinctly audible to the runaway.

'If you don't come out before I count five, you are a dead man.—One—two—three!'

'Stop! For mercy's sake, give me a chance!'

Now pleaded the wretch in a husky whisper.

'First throw your knife this way, and then come out.'

The villain tossed his knife to Williams, who threw it behind him to the other extremity of the attic; then leaving his retreat, he crawled towards us, and I was surprised to see by the dim light of the candle that he was attired in plain clothes. When he got near us, we were astonished beyond measure to find that he was not the man of whom we had been in search, but Scales's companion the deserter, who had been suspected of rifling the officer's room!

'I own I took the things,' confessed the man doggedly, seemingly anxious to make a clean breast of it; 'but Scales helped me, and old Nathan put us both on the job!'

'Scales has been here,' I interrupted. 'You may as well tell me what you know about him; it will be the better for you.'

'Yes,' replied the deserter, when he dropped through the trap on the floor; 'I got off his handcuffs, and here they are,' scattering a heap of bones and displaying the 'bracelets,' each receptacle for the wrists being filed in two.

'Now,' I continued, 'if you can give me any information that will enable me to catch Scales, I'll report in your favour at headquarters. Perhaps it will save you something when you are tried.—Where is he now?'

'Well, sergeant, Nathan gave him a suit of "plains," and he went out. I don't know where he has gone. But I don't mind "rounding" on him, and I'll tell you this: he's to be back here to-night at twelve. Nathan's to let him in by the little window that looks into the yard.'

We then descended the stair with our prisoner; and the man perceiving the Jew, broke away from us, exclaiming: 'You old villain! if it hadn't been for you, I wouldn't have got into this!' and before we could prevent him, struck the miserable Israelite a terrible blow. This act of castigation, under the circumstances, however, rather pleased me than otherwise.

Two additional policemen having been summoned, the deserter and Nathan were taken away in custody. When they had gone, I was rather amused when Williams informed me that, despite the Jew's extreme trepidation, while I

was examining his upper storey, his commercial proclivities did not for a moment desert him, as he attempted to open negotiations with the private regarding the purchase of his war medals.

Two detectives now arrived to search the premises; but of course this investigation did not lie within my province. No article of a criminating nature was found, however, except Scales's uniform, which was concealed beneath the Jew's filthy mattress. I lost no time in despatching my companion to an adjacent blacksmith's shop, in order to have the divided parts of the handcuffs welded together; and this operation was completed within an hour.

It was now dark; the Jew's house had been locked up by the police; so my companion and I turned into the back yard, in order to await the expected return of Scales. We first made sure that he was not concealed about the dilapidated outhouses, which consisted of a disused coal-cellar and shed. In the latter place we set a couple of boxes, and seating ourselves upon them, with our loaded rifles within reach, patiently awaited the return of the runaway—prepared, if need be, to give him a very warm reception. As the night wore on, the sky became clouded, while the oppressive heat was apparently the precursor of a thunderstorm. Suddenly, we were startled by a loud clap, followed almost immediately by a blinding flash of lightning, which, as we could see from our place of vantage, vividly lighted up the towering chalk cliffs that overhung the town. Then rain began to fall in torrents, and the decayed roof of the shed proving most indifferent shelter, we were compelled to put on our greatcoats. To add to our misery, the floor became a regular pool, occasioned by the overflow of a huge water-butt.

After a while the storm ceased as suddenly as it had begun; and being perfectly overpowered with fatigue and the day's excitement, I fell fast asleep, and slumbered until Williams shook me up and informed me that the town clocks had struck twelve. Being stiff and chilled with the drenching I had received, I got on my feet and took a turn about the shed, keeping at the same time a wary eye on the wall, every minute expecting to see the form of the fugitive in the act of scaling it. The monotony of our vigil was now a little relieved by the appearance of the Jew's cat, a large brindled animal, which came purring and rubbing against us. Williams took Puss in his arms and caressed her for some time; and when he got tired of this amusement, he stepped over to the water-butt and, acting on a sudden mischievous impulse, tossed the animal inside. To our surprise, a howl of pain proceeded from the interior of the caulk; and upon investigation there stood our prisoner up to the neck in water! Williams had thrown the frightened cat with outstretched claws plump on his face. The poor wretch was stiff and numb with cramp, and was perfectly unable to get out of the butt. We then, with a heavy plank, stove it in near the bottom, and when it was empty, assisted Scales to the shed, where I made him at once strip off his wet clothes—with which Nathan had provided him—and assume his uniform. When the shivering wretch was able to speak, he informed us, that having returned

sooner than arranged, and perceiving the arrest of the Jew and the deserter, he was so overcome with fright, that he took refuge in the water-butt, as no other place of concealment was available. At dusk, he was thinking of getting out of his uncomfortable hiding-place, when he was deterred by seeing us take up a position in the yard. He had, he asserted, been nearly drowned by the volumes of water that poured on his head during the thunderstorm, and confessed to having been terribly scared by the lightning—a circumstance, considering his situation, perhaps not to be wondered at. Also, he admitted, he had actually been concealed in an empty barrel on the drayman's cart, and that the driver had further facilitated his escape by arranging with a fellow-wagoner to have him transferred to his vehicle and driven to the alley in which the Jew's shop was situated.

In consideration of the trouble Scales had given us, I had but little sympathy with his sufferings, and put slender faith in his profuse promises to go with us quietly. Having replaced on his wrists the repaired handcuffs, of which the previous day he had managed to get relieved so speedily, I decided also, by way of making assurance doubly sure, to strap his arm to that of Williams.

We then set out in the direction of our destination; but Scales, even supposing he intended mischief, was too much played out to give any further trouble. At last, to my intense relief, we reached the prison at daybreak, and I handed Mr Scales over to the custody of a warder.

My comrade and I, after partaking of much-needed refreshment kindly offered us by one of the prison officials, returned to headquarters, where I lost no time in reporting the whole circumstances of the case to the adjutant.

That officer ordered the private and myself to appear before the commanding officer, a command which at 'orderly hour' we obeyed. The colonel administered to us—to speak paradoxically—a commendatory reprimand, alternately animadverting on the enormity of our offence in allowing the man to escape, and praising the qualities of courage and perseverance we had displayed in tracking and capturing him, together with the missing thief—'Conduct,' as the commanding officer was pleased to put it, 'which is creditable to the British army in general, and the —th Regiment in particular.'

The Jew was committed for trial on a charge of receiving stolen property; but a day or two before the assizes, he committed suicide by strangling himself in his cell.

The deserter was handed over to the civil authorities, and received a long term of imprisonment; and a similar fate awaited Scales when his term in the military prison had expired. The case of the latter individual was further considered by the general, who cancelled his remission of Scales's discharge with ignominy, so that Her Majesty's —th Regiment of foot was happily enabled to get rid of a knave.

I may now relate my final experience with regard to the foregoing adventure. The sergeant of the barrack-guard reported the roughly repaired handcuffs to the orderly officer, who mentioned the matter in the return he sent to the orderly-room. The case was then remitted

to the quartermaster, who had the handcuffs examined by the armourer; and that functionary having reported them unfit for service, I was mulcted in the sum required for a new pair. I paid the charge without grumbling, as, everything considered, I was heartily glad to get off so cheap.

MONEY LENT!

YOUNG Sixty per Cent. flourishes in the off-streets of the Haymarket and Regent Street. From his babyhood, money has been the chief joy of his existence; his infant rattle jingled with silver coins, and at school he amassed a small fortune by lending shillings at frightfully usurious rates till 'after the holidays.' His chief study was arithmetic, and the supreme moment of his early life was when his father playfully gave him the complicated account of an earl of racing and theatrical tastes to make out, and he succeeded beyond all expectation, making such a beautifully innocent mistake of forty or fifty pounds on the side of the firm, that it was felt that such talent should no longer be wasted at the academy of Dr Birchington. He became a regular attendant at 'the office,' and at the age of twenty, knew as well as any one with twice his years the worth of any given name on stamped paper. He succeeded to the general control of the business, being assisted in the ornamental duties of the position by an elder brother, who had gone to the bad through the usual channels, but had always plenty of gossip and good stories for 'clients.'

The office is a plain room, without picture or ornament, but covered with a rich soft carpet, and 'upholstered' in the very best taste. The desk is a very solid piece of mahogany, with different keys for every drawer, and with numerous secret recesses. Should the straits of fortune at any time drive you to seek the assistance of Sixty per Cent., it is into this room you will be ushered by the long-legged boy in the ante-room, who appears to divide his time between cracking nuts and casting up the figures in a diabolical ledger; but he has other uses, and if anybody should be foolish enough to cut up 'rumbustical' with the usurer, the youth has his orders. You will find Sixty per Cent. clean, well attired, and agreeable, seated at the desk; and your business proving satisfactory, you will be turned over to 'my brother,' who will regale you with some spicy anecdotes, an excellent glass of sherry, and a cigar, and such gossip of the town as may seem to be to your taste.

Meantime, the boy has been despatched to Berners Street to obtain information from certain lists in the possession of that mysterious body known as the T. P. S., which are open to the privileged in that thoroughfare; and Sixty per Cent. occupies himself with consulting the rack of books on his desk, containing Burke, Debreit, the Army List, the University Calendars, the Clergy List, &c., according to what may be your requirements; and when the boy has returned with satisfactory accounts of yourself or your securities, your signature on some neatly written

slips of blue paper produces the cheque that relieves your necessities. 'Not half a bad fellow,' you tell your friends; and you are convinced he is the victim of prejudice. But woe betide you, should the time ever come when, the sud of your tether reached, you plead delay or ask abatement of your bond! There is no mercy in that hawk face, pleasantly though it can smile; and the soft, well-kept hands can strike like a hawk's talons when the occasion arises. There are times—usually early, before the ordinary hours of business—when Sixty per Cent. may be found in conversation at his office with a shady-looking individual who has 'minion of the law' stamped legibly on his countenances; and this tons in which the usurer utters such sentences as 'Broke at Doncaster last week'—'The writs are out already'—'Sell him up, stock, lock, and harrel'—'Going to bolt, I believe'—'Hang his wife and family!' &c., is rather different from the suave accents in which he usually addresses his clients.

He is fond of music, and is a pretty regular frequenter of the opera on Saturday nights during the season; and in the lobby, often manages to combine a little business with his pleasure, especially in the Epsom, Ascot, and Newmarket July weeks, when hackers have had what is termed a facer. He sports a smart mail phaeton with a pair of high stepping bays; and as he drives round the park of an afternoon, he can impart a pretty considerable amount of information to any friend who happens to be with him regarding the occupants of the drags and victorias that they meet. He has his 'bad times,' like everybody else, and when, as occasionally happens, he has an enforced interview with one of Her Majesty's judges, he is obliged to listen to some remarkably plain speaking in respect of his little transactions; and should a vaulting ambition induces him to seek membership in any more respectable club than the third-rate 'proprietary pothouse,' his *amour propre* is liable to be considerably wounded by the extent of this 'pilling,' he is subjected to. As a rule, however, he is early taught to 'keep his place,' and 'recreates' himself with gambling in stocks, huying old china, or breeding poultry; jingles the sovereigns in his pocket, and snaps his fingers at the world and its opinion.

PROFESSOR SHELDON ON BUTTERINE.

Professor Sheldon, who delivered an exhaustive paper on the 'Butterine Question' at a meeting of the Farmers' Alliance, said that the quantity of butterine produced in Great Britain was not known, but was understood to be considerable; nor was the volume of imported butterins known before the beginning of 1885, because, up to the end of 1884, it was entered in the Board of Trade Returns under the heading of 'butter.' The weight of butterine imported in the four months ending April 1885 was 308,548 cwt., and in the corresponding months of this current year the volume of it had risen to 324,275 cwt. The quantity of butterine imported, at the rate of the past four months, amounts to one hundred and thirty tons a day, day in and day out, Sunday and Monday alike, or getting on towards fifty thousand tons a year; and this

over and above what is produced in the United Kingdom. The effect of the enormous trade on the dairy-farming of this country may be easily imagined, and foreign dairy-farmers are also feeling the competition quite as keenly. The Professor admitted that butterine, when made in a proper way and from good materials, is a wholesome and useful article of food. He considered it beyond dispute that butter would have been outside the reach of a vast number of poor people, had not butterins come in as a substitute and lowered the price. He admitted that well-made butterine is a very tolerable substitute, though it is not butter in another form, as some would have us believe. The utilisation of surplus fat in the form of butterine was about the best possible way in which it could be used at all as an article of food and in a systematic manner. The clause relating to the penalties to be imposed upon retailers who sold butterine as butter, in the Butter Substitutes Bill before parliament, he considered the most important clause in the bill, as it concerned the men who had hitherto been the chief offenders.

YOUTH AND AGE.

YOUTH.

When I am old, these hills that bound
My life within their narrow round,
Will be the threshold of the door
That leads to Freedom and to Fame,
And the wide world beyond no more
An idle dream, an empty name,
But I, from cares and troubles free,
Its glories and its joys shall see.

The summer isles of southern seas;
Great battles, glorious victories;
The boundless prairies of the West,
Where red men hunt the buffalo;
Whatever fairest gifts and best
The gods have given to men below—
These, heart of mine, these shall we see
In the brave days that are to be.

AGE.

When I was young, this narrow round
Of hills a glorious world did bound;
Here, on the quiet valley floor,
I dreamed of Freedom and of Fame,
Ere yet I learned they were no more
Than a vain dream, an empty name;
In that glad careless long ago,
The happy hours seemed all too slow.

I have been wrecked in stormy seas;
Not mine life's glories victories;
Gone the bright spell on boyhood cast;
No more along the primrose way
I wander, for my path has passed
To this and world of everyday.
Ah, heart of mine, no more we know
The days and dreams of long ago!

MODERN SLAVERY.

A WORD FOR OUR SHOP-ASSISTANTS.

THAT we, as a nation, are not lovers of change for the sake of change, can hardly be disputed; indeed, our conservatism in minor matters may justify the reflection cast upon us by our neighbours. But although we may be willing to continue patronising forms and institutions that may justly be considered antiquated and effete, yet it is nevertheless a fact that once got the public ear, and the cry of the oppressed will never be raised in vain, even though redress involves uprooting of old-established customs. Opposition to sudden and violent changes there may be; but the familiar instance of our factory laws shows that there is help for the poorest and weakest, let the need for help once be made known. But, unhappily, those who most need assistance are just those least able to plead their own cause, either from ignorance or from fear of the consequences of complaint. Such was the case with the children, who needed an outsider's voice to raise their 'cry'; and with those women-labourers, the story of whose underground toils and miseries needed but to be heard, to awake indignant protest against the whole system which could produce such results. In the latter case, so sweeping was the reform, that the recurrence of the evil is impossible; and though the working of the Factory and Workshop Act may not be altogether perfect, it affords a considerable measure of protection to the helpless, and stands as a wholesome check between oppressor and oppressed.

By the Factory Act, not only are factories proper placed under government inspection, but all proprietors of workshops or workrooms are liable to the salutary visit of the inspector, whose duty it is to see that the terms of the Act are complied with; that is, that the 'hands' work only a certain specified number of hours; and that due regard is paid to ventilation and sanitary precautions. But the inspector's boundary is the

workshop or workroom, and beyond this he is powerless to interfere; although on his way to his department he frequently passes by large numbers of those who need supervision and protection fully as much as those on whose behalf his visit is paid, yet who, as the law now stands, are utterly and hopelessly in the power of employers, who are free if they will to work their victims to death with impunity.

Not, of course, that all employers are deaf to the claims of humanity and think only of their own gain; on the contrary, many large establishments are remarkable for the attention given to the comfort of employees, who work only a fair number of hours, are well housed, and treated generally with consideration. But even in such cases, the restrictions and regulations are purely voluntary, and it is quite conceivable that a change of proprietorship might involve a complete reversion of the order of things; and as a fact, the vastly larger part of retail business is carried on in a manner that makes the position of the shop-assistant practically one of cruel slavery. Not that the work is in itself laborious; though, as it involves of necessity an unusual amount of standing, it is not suited to the naturally feeble or delicate. The assistant's chief hardships centre round the abnormal length of his working-day, a day so protracted that none but the strongest can bear the strain. The standing itself becomes very much a matter of habit to the robust, provided the hours are reasonable, and that sufficient time is allowed for meals to enable the worker to get a real rest at least twice during a day of twelve hours, in addition to a regular weekly half-holiday. The assistant's working hours should number about sixty per week, certainly not a low percentage; but, as matters now stand, it is no exaggeration to say that a very large majority of shop-assistants work from eighty to ninety hours a week, out of which, in many cases, no regular meal-times are allowed, food being hastily eaten, and work resumed as soon as the too hasty meal is finished. Nominally, indeed, there are

ated times for meals in most establishments, in the better classes of which the assistants enjoy the meal in comfort; but in too many cases the unfortunate assistant has to accommodate his appetite to suit the tide of customers.

Thirteen or fourteen hours daily, with scarcely a break, would be considered hard work, were it carried on under the invigorating influence of fresh air, or were the work of a varied or partly sedentary nature; but when, in addition to the length of hours, there is the weary monotony of standing, the pain of which increases with every hour of violence to nature, and the fact that, in the large majority of cases, the air breathed is vitiated and impure, it needs but a little foresight to predict that a few years of such slavery will put an end to the working-power of its victims.

Let any impartial observer take note of the ages of shop-assistants—especially in poor, crowded neighbourhoods—and he can hardly fail to be struck by the fact that the very large majority are young, and that the apprentice-age predominates. Indeed, it is not the least sad part of the picture that the crushing influence of habitual overwork is brought to bear most heavily upon the young man or woman, hardly more than boy or girl, who begins the new career full of the illusions of youth, and finds, long before the years of apprenticeship are over, that the capital of health and strength is either entirely gone or fast declining. Cases have come within our own experience in which the rosy cheeks and exuberant spirits of fifteen or sixteen have at nineteen or twenty given way to the pale face and languid, artificial smile habitual to the overworked, who, in spite of pain and weariness, are forced to keep up the semblance of cheerfulness. In one instance, the gradual lowering of tone caused such a susceptibility to disease, that an ordinary cold was sufficient to extinguish the feeble flame of life; and in other cases, tendencies to special ailments have arisen, distinctly traceable to the over-taxing of immature strength.

This personal experience is fully corroborated by many who have taken sufficient interest in the question to study the causes and effects of a system involving such a large amount of avoidable suffering to an important section of society. To take but one instance. The Rev. J. S. Webber, chaplain of University College Hospital, writing to the President of the Shop Hours' Labour League, says: 'I have noticed the result of long hours amongst the assistants employed at the smaller houses of business—have met with many a young girl, broken down in health, with the brain weakened. Instead of getting a walk after business, or enjoying some other healthy recreation, they have resorted to stimulants in the shape of intoxicating drinks, to keep up, as they fancy, the poor fragile frame. We find in our Sunday schools that the poor teachers who are assistants in shops cannot get to school on Sunday morning. This also applies to church. The shop-assistant is at a terrible disadvantage compared with the mechanic. Many of the former cannot leave business until nine or ten every evening, and twelve o'clock on Saturday, with body and mind so exhausted, whatever educational advantages

might offer, they are too exhausted to do anything but rest.' This testimony from a man of large experience touches upon two or three of the incidental but by no means slight effects of overwork. Sunday, to the aching body and weary brain of the shop-assistant, whose Saturday, instead of being a half-holiday, is the crowning point to a week of toil, may bring with it something of physical refreshment; it certainly has little chance of affording that quiet time for reflection and spiritual exercise essential to the development of noble life.

Again, as to innocent recreation—the health-giving walk, stimulating game, and harmless musical entertainment, are as entirely beyond the reach of the shop-assistant as are the educational advantages offered by public lecture, picture-gallery, or library. His, or her, life is, in fact, an example of the 'all work and no play' which in the nature of things produces 'a dull boy'—or girl. And with whatever ability or education the shop career is begun, it is a pretty sure thing that the mind will become so stupefied with the burden of physical weariness, that the inclination towards self-culture will quickly vanish, and the overworked assistant sinks into a state of apathy, which, especially in the case of the male assistant, reduces him to the dead-level of hopeless existence; and not only is his present life a burden, but the ordinary castle-building of the young man has very limited play in his case; for every dream of future bliss is checked by the reflection that should he dare to face poverty and found for himself a home, his services will very probably be at a discount, the married assistant standing a worse chance of employment than the single.

Who shall wonder if, under such circumstances, the young man or woman is not always proof against the temptations of those more than doubtful pleasures which present the only substitute for natural and rational enjoyments?

What is the medical voice on this question of overwork, need hardly be said. Whenever a doctor writes or speaks on the subject, he is sure to give unequivocal testimony as to the premature failure of health amongst shop-assistants in general, and especially amongst growing boys and girls, whose immature frames cannot, without injury, be made to habitually violate every physiological law. And yet, in face of all this, the market is so overstocked with volunteers for slavery, that the master has matters completely in his own hands, and is perfectly safe in defying rebellion, sure that were the whole of his assistants to leave to-day, their places could with ease be filled to-morrow.

Much of this over-supply is due to ignorance on the part of parents and guardians, who, finding a 'gentle' employment for the boy or girl, do not stop to inquire what goes on behind the curtain of gentility. And by the time his apprenticeship is over, the assistant is not at an age to mark out for himself a new career, and is bound to make the best of a bad bargain. Not only so, but one of the special drawbacks to shop-labour is the fact that if the employee offends his employer in any way, even to such matters as attending a meeting or taking in a paper that is disapproved of, he is liable to dismissal without a

reason and without a character; so that virtually the shop-assistant gives into his employer's hands the absolute control of his time, his health, and his character; and whatever may be the results of that surrender, escape or redress is equally unattainable.

Again, we repeat that many employers refrain from taking advantage of their power; but nevertheless the fact remains, that a master who, through thoughtlessness or greed, overworks, under-pays, badly houses and badly feeds his employees, or dismisses them without a character, is at perfect liberty to do so, and is in no danger of being called to account for his actions!

The Early Closing Association has done something towards procuring at least an amelioration of the shop-assistant's condition, by seeking to establish a universal half-holiday. It works on the persuasive line, and in some parts of London and in many provincial towns has succeeded in securing this boon of half a day's rest; but persuasion alone will never be able to treat with an evil so widespread; for, as long as the early closing is purely voluntary, so long it will be in the power of any one man to compel a whole neighbourhood to refuse or abolish the half-holiday. If his shop is open when others are closed, he will to a certainty obtain customers; and this is an advantage his neighbours dare not allow him; therefore, they must follow suit and keep open at his pleasure.

In this one-man power lies the secret of the present abnormal length of hours; for it is a matter of experience that as long as shops are open, so long customers will continue to come; and hence competition has suggested lengthening of hours with a view to checkmating neighbours. Yet no method of doing business ever brought with it more disadvantage, for less gain. The public is certainly no better off than if shopping had to be got through in reasonable time; and beyond dispute, the shopkeeping class is not only no better, but very much worse off for this tyranny of custom, which compels even the unwilling employer to keep his assistants at work far beyond the ordinary limits of labour. And so deep-seated and established has the slavery become, that there remains nothing for it but an appeal to the State to interfere with an extension of the Factory and Workshop Act; and although we are by no means of those who believe in 'grandmotherly legislation,' this is a case, if ever there was one, in which the strong hand of the law alone can lift a whole section of society out of the misery in which it now lies, and from which, unaided, it can never escape. An extension of the Factory Act, although it would of necessity leave the shop-assistant's hours longer than those of most workers, would at least protect him from unlimited labour, and would insure his work being carried on under fairly healthy conditions.

The grumbling section of the public would doubtless raise many objections to a shopping day of only twelve hours; but we confidently prophesy that a year's probation would show the new order of things to be no hardship to the purchaser; and as regards employers, although, doubtless, many will make great capital out of the grievance of coercion, the more sensible and far-sighted will recognise the fact that on this

question at least the interests of employer and employed are identical. Once insure that all shops shall be limited to the same number of hours, and there need be no anxiety as to loss of business. The consumer's wants must be met, and if he has only a limited (and reasonable) number of hours in which to do his shopping, he will have no choice but to adapt his habits to the new order of things.

Hardship, of course, it would be if the law were limited to certain neighbourhoods, or if clashing trades were not all under the same restriction; but as long as there was one uniform code for all, the only difference to the shopkeeper would be greater personal leisure without loss of business. To those heads of large establishments to whom reference has already been made, this may seem a trifling matter; but many and many a small shopkeeper will rejoice, fully as much as his assistants, in freedom from the excessive toil which makes his life as much a slavery as theirs, and from which he is equally powerless to escape.

Under the name of the 'Shop Hours' Labour League,' a scheme has been set on foot having for its object the presentation to parliament of such a bill as has been suggested; and the interest of every individual member of society is earnestly invited, in the hope of creating a public conscience on a question affecting thousands of workers, whose services are essential to the comfort of the community. The President of the League, Thomas Sutherst, Esq., barrister-at-law, has compiled a shilling volume on the subject, which, under the somewhat sensational title of *Death and Disease behind the Counter*, contains a large amount of sober fact, and can scarcely fail to awaken strong feeling in the mind of every reader who takes an interest in the welfare of his fellows. The League needs help, not in money, but in personal effort and influence; and Mr Sutherst (3 Dr Johnson's Buildings, London), whose work is purely a labour of love, is ready to give information, or to suggest methods by which help may be rendered to a cause which thoroughly deserves the heartiest support.

IN ALL SHADES.

CHAPTER XXXV.

At the dinner that evening, Macfarlane, the Scotch doctor, took in Nora; while Harry Noel had handed over to his care a dowager-planteress from a neighbouring estate; so Harry had no need to talk any further to his pretty little hostess during that memorable Tuesday. On Wednesday morning he had made up his mind he would find some excuse to get away from this awkward position in Mr Dupuy's household; for it was clearly impossible for him to remain there any longer, after he had again asked Nora and been rejected; but of course he couldn't go so suddenly before the dinner to be given in his honour; and he waited on, impatiently and sulkily.

Tom Dupuy was there too; and even Mr Theodore Dupuy himself, who knew the whole secret of Harry's black blood, and therefore regarded him now as almost beyond the pale of human sympathy, couldn't help noticing to

himself that his nephew Tom really seemed quite unnecessarily anxious to drag this unfortunate young man Noel into some sort of open rupture. 'Very ill advised of Tom,' Mr Dupuy thought to himself; 'and very bad mauners too, for a Dupuy of Trinidad. He ought to know well enough that whatever the young man's undesirable antecedents may happen to be, as long as he's here in the position of a guest, he ought at least to be treated with common decency and common politeness. To-morrow, we shall manage to hunt up some excuse, or give him some effectual hint, which will have the result of clearing him bodily off the premises. Till then, Tom ought to endeavour to treat him, as far as possible, in every way like a perfect equal.'

Even during the time while the ladies still remained in the dining-room, Tom Dupuy couldn't avoid making several severe hits, as he considered them, at Harry Noel from the opposite side of the hospitable table. Harry had happened once to venture on some fairly sympathetic commonplace remark to his dowager-planteress about the planters having been quite ruined by emancipation, when Tom Dupuy fell upon him hotly, and called out with an unconcealed sneer: 'Ruined by emancipation!—ruined by emancipation! That just shows how much you know about the matter, to talk of the planters being ruined by emancipation! If you knew anything at all of what you're talking about, you'd know that it wasn't emancipation in the least that ruined us, but your plaguy parliament doing away with the differential duties.'

Harry hit his lip, and glanced across the table at the young planter with a quiet smile of superiority; but the only word he permitted himself to utter was the one harmless and neutral word 'Indeed!'

'O yes, you may say "Indeed" if you like,' Tom Dupuy retorted warmly. 'That's just the way of all you conceited English people. You think you know such a precious lot about the whole subject, and you really and truly know in the end just less than absolutely nothing.'

'Pardon me,' Harry answered carelessly, with his wine-glass poised for a moment half lifted in his hand. 'I admit most unreservedly that you know a great deal more than I do about the differential duties, whatever they may be, for I never so much as heard their very name in all my life until the present moment.'

Tom Dupuy smiled a satisfied smile of complete triumph. 'I thought as much,' he said exultantly; 'I knew you hadn't. That's just the way of all English people. They know nothing at all about the most important and essential matters, and yet they venture to talk about them for all the world as if they knew as much as we do about the whole subject.'

'Really,' Harry answered with a good-humoured smile, 'I fancied a man might be fairly well informed about things in general, and yet never have heard in his pristine innocence of the differential duties. I haven't the very faintest idea myself, to tell you the truth, what they are. Perhaps you will be good enough to lighten my darkness.'

'What they are!' Tom Dupuy ejaculated in pious horror. 'They aren't anything. They're gone away with. They've ceased to exist long

ago. You and the other plaguy English people took them off, and ruined the colonies; and now you don't as much as know what you've done, or whether they're existing still or done away with!'

'Tom, my boy,' Mr Theodore Dupuy interposed blandly, 'you really mustn't hold Mr Noel personally responsible for all the undoubted shortcomings of the English nation! You must remember that his father is, like ourselves, a West Indian proprietor, and that the iniquitous proceedings with reference to the differential duties—which nobody can for a moment pretend to justify—injured him every bit as much as they injured ourselves.'

'But what are the differential duties?' Harry whispered to his next neighbour but one, the Scotch doctor. 'I never heard of them in my life, I assure you, till this very minute.'

'Well, you know,' Dr Macfarlane responded slowly, 'there was a time when sugar from the British colonies was admitted into Britain at a less duty than sugar from Cuba or other foreign possessions; and at last, the British consumer took the tax off the foreign sugar, and cheapened them all alike in the British market. Very good, of course, for the British consumer, but clean ruin and nothing else for the Trinidad planter.'

For the moment, the conversation changed, but not the smouldering war between the two belligerents. Whatever subject Harry Noel happened to start during that unlucky dinner, Tom Dupuy, watching him closely, pounced down upon him at once like an owl on the hover, and tore him to pieces with prompt activity. Harry bore it all as good-naturedly as he could, though his temper was by no means naturally a forbearing one; but he didn't wish to come to an open rupture with Tom Dupuy at his uncle's table, especially after that morning's occurrences.

As soon as the ladies had left the room, however, Tom Dupuy drew up his chair so as exactly to face Harry, and began to pour out for himself in quick succession glass after glass of his uncle's fiery sherry, which he tossed off with noisy hilarity. The more he drank, the louder his voice became, and the hotter his pursuit of Harry Noel. At last, when Mr Theodore Dupuy, now really alarmed as to what his nephew was going to say next, ordered in the coffee prematurely, to prevent an open outbreak by rejoining the ladies, Tom walked deliberately over to the side-board and took out a large square decanter, from which he poured a good-sized liqueur-glassful of some pale liquid for himself and another for Harry.

'There!' he cried boisterously. 'Just you try that, Noel, will you. There's liquor for you! That's the real old Pimento Valley rum, the best in the island, double distilled, and thirty years in bottle. You don't taste any *hogo* about that, Mr Englishman, eh, do you?'

'Any what?' Harry inquired politely, lifting up the glass and sipping a little of the contents out of pure courtesy, for neat rum is not in itself a very enticing beverage to any other than West Indian palates.

'Any *hogo*,' Tom Dupuy repeated loudly and insolently—'*hogo, hogo*. I suppose, now, you mean to say you don't even know what *hogo* is,

do you?—Never heard of *hogo*? Precious affection! Don't understand plain language! Yah, rubbish.'

'Why, no, certainly,' Harry assented as calmly as he was able; 'I never before did hear of *hogo*, I assure you. I haven't the slightest idea what it is, or whether I ought rather to admire or to deplore its supposed absence in this very excellent old rum of yours.'

'*Hogo's* French,' Tom Dupuy asserted doggedly, '*Hogo's* French, and I should have thought you ought to have known it. Everybody in Trinidad knows what *hogo* is. It's French, I tell you. Didn't you over learn any French at the school you went to, Noel?'

'Excuse me,' Harry said, flushing up a little, for Tom Dupuy had asked the question very offensively. 'It is *not* French. I know enough of French at least to say that such a word as *hogo*, whatever it may mean, couldn't possibly be French for anything.'

'As my nephew pronounces it,' Mr Dupuy put in diplomatically, 'you may perhaps have some difficulty in recognising its meaning; but it's our common West Indian corruption, Mr Noel, of *haut gold*—*haut gold*, you understand me—precisely so; *haut gold*, or *hogo*, being the strong and somewhat offensive molasses-like flavour of new rum, before it has been mellowed, as this of ours has been, by being kept for years in the wood and in bottle.'

'Oh, ah, that's all very well! I suppose you're going to turn against me now, Uncle Theodore,' Tom Dupuy exclaimed angrily—ho was reaching the incipient stage of quarrelsome drunkenness. 'I suppose you must go and make fun of me, too, for my French pronunciation as well as this fine-spoken Mr Noel here. But I don't care a pin about it, or about either of you, either. Who's Mr Noel, I should like to know, that he should come here, with his fine new-fangled English ways, setting himself up to be better than we are, and teaching us to improve our French pronunciation!—O yes, it's all very fine; but what does he want to go stopping in our houses for, with our own ladies, and all that, and then going and visiting with coloured rubbish that I wouldn't touch with a pair of tongs—the woolly-headed niggers!—that's what I want to know, Uncle Theodore!'

Mr Dupuy and Harry rose together. 'Tom, Tom!' Mr Dupuy cried warningly, 'you are quite forgetting yourself. Remember that this gentleman is my guest, and is here to-day by my invitation. How dare you say such things as that to my own guest, sir, at my own table? You insult me, sir, you insult me!'

'I think,' Harry interrupted, white with anger, 'I had better withdraw at once, Mr Dupuy, before things go any further, from a room where I am obviously, quite without any intention on my own part, a cause of turmoil and disagreement.'

He moved hastily towards the open window which gave upon the lawn, where the ladies were strolling, after the fashion of the country, in the silvery moonlight, among the tropical shrubbery. But Tom Dupuy jumped up before him and stood in his way, now drunk with wine and rum and insolence and temper, and blocked his road to the open window.

'No, no!' he cried, 'you shan't go yet!—I'll tell you all the reason why, gentlemen. He shall hear the truth. I'll take the vanity and nonsense out of him! He's a brown man himself, nothing but a brown man!—Do you know, you fine fellow you, that you're only, after all, a confounded woolly-headed brown mulatto? You are, sir! you are, I tell you! Look at your hands, you nigger, look at your hands, I say, if ever you doubt it.'

Harry Noel's proud lip curled contemptuously as he pushed the half-tipsy planter aside with his elbow, and began to stride angrily away towards the moonlit shrubbery. 'I daresay I am,' he answered coolly, for he was always truthful, and it flashed across his mind in the space of a second that Tom Dupuy was very possibly right enough. 'But if I am, my good fellow, I will no longer inflict my company, I tell you, upon persons who, I see, are evidently so little desirous of sharing it any further.'

'Yes, yes,' Tom Dupuy exclaimed madly, planting himself once more like a fool in front of the angry and retreating Englishman, 'he's a brown man, a mulatto, a coloured fellow, gentlemen, own cousin of that precious nigger scamp, Isaac Pourtales, whose woolly head I'd like to knock this minute against his own woolly head, the insolent upstart! Why, gentlemen, do you know who his mother was? Do you know who this fine Lady Noel was that he wants to come over us with? She was nothing better, I swear to you solemnly, than a common brown wench over in Barbadoes!'

Harry Noel's face grew livid purple with that foul insult, as ho leapt like a wild beast at the roaring West Indian, and with one fierce blow sent him reeling backward upon the floor at his feet like a senseless lump of dead matter. 'Hound and cur! how dare you?' he hissed out hoarsely, planting his foot contemptuously on the fallen planter's crumpled shirt-front. 'How dare you?—how dare you? Say what you will of me, myself, you miserable blackguard—but my mother! my mother!' And then, suddenly recollecting himself, with a profound howl to the astonished company, he hurried out, hatless and hot, on to the darkling shrubbery, casting the dust of Orange Grove off his feet half instinctively behind him as he went.

Next moment a soft voice sounded low beside him, to his intense astonishment. As he strode alone across the dark lawn, Nora Dupuy, who had seen the whole incident from the neighbouring shrubbery, glided out to his side from the shadow of the star-apple tree and whispered a few words earnestly in his ear. Harry Noel, still white with passion and trembling in every muscle like a hunted animal, could not but stop and listen to them eagerly even in that supreme moment of righteous indignation. 'Thank you, Mr Noel,' she said simply—'thank you, thank you!'

CHAPTER XXXVI.

The gentlemen in the dining-room stood looking at one another in blank dismay for a few seconds, and then Dr Macfarlane broke the breathless silence by saying out loud, with his broad Scotch bluntness: 'Ye're a fool, Tom Dupuy—a very fine fool, ye are; and I'm not sorry the young

Englishman knocked you down and gave you a lesson, for speaking ill against his own mother.'

'Where has he gone?' Dick Castello, the governor's aide-de-camp, asked quickly, as Tom picked himself up with a sheepish, awkward, drunken look. 'He can't sleep here to-night now, you know, and he'll have to sleep somewhere or other, Macfarlane, won't he?'

'Run after him,' the doctor said, 'and take him to your own house. Not one of these precious Trinidad folk'll stir hand or foot to befriend him anyhow, now they've been told he's a brown man.'

Castello took up his hat and ran as fast as he could go after Noel. He caught him up, breathless, half-way down to the gate of the estate; for Harry, though he had gone off hurriedly without bet or coat, was walking alone down the main road coolly enough now, trying to look and feel within himself as though nothing at all unusual in any way had happened. 'Where are you going to, Noel?' Castello asked, in a friendly voice.—'By Jove! I'm jolly glad you knocked that fellow down, and tried to teach him a little manners, though he's old Dupny's nephew. But of course you can't stop there to-night. What do you mean now to do with yourself?'

'I shall go to Hawthorn's,' Harry answered quietly.

'Better not go there,' Dick Castello urged, taking him gently by the shoulder. 'If you do, you know, it'll look as if you wanted to give a handle to Tom Dupuy and break openly with the whole lot of them. Tom Dupuy insulted you abominably, and you couldn't have done anything else but knock him down, of course, my dear fellow; and he needed it jolly well, too, we all know perfectly. But don't let it seem as if you were going to quarrel with the whole lot of us. Come home to my house now at Savannah Garden. I'll walk straight over there with you and have a room got ready for you at once; and then I'll go back to Orange Grove for Mrs Castello, and bring across as much of your luggage as I can in my carriage, at least as much as you'll need for the present.'

'Very well, Captain Castello,' answered Noel submissively. 'It's very kind of you to take me in. I'll go with you; you know best about it. But bang it all, you know, upon my word I expect the fellow may have been telling the truth after all, and I daresay I really am what these fools of Trinidad people call a brown man. Did ever you hear such absurd nonsense? Calling me a brown man! As if it ever mattered twopenny to any sensible person whether a man was black, brown, white, or yellow, as long as he's not such a confounded cad and boor as that roaring tipsy lout of a young Dupuy fellow!'

So Harry Noel went that Tuesday night to Captain Castello's at Savannah Garden, and slept, or rather lay awake, there till Wednesday morning—the morning of the day set aside by Louis Delgado and Isaac Pontrails for their great rising and general massacre.

As for Nora, she went up to her own boudoir as soon as the guests had gone—they didn't stay long after this awkward occurrence—and threw herself down once more on the big sofa, and

cried as if her heart would burst for very anguish and humiliation.

He had knocked down Tom Dupuy. That was a good thing as far as it went! For that at least, if for nothing else, Nora was duly grateful to him. But had she gone too far in thanking him? Would he accept it as a proof that she meant him to reopen the closed question between them? Nora hoped not, for that—that at any rate was now finally settled. She could never, never, never marry a brown man! And yet, how much nicer and bolder he was than all the other men she saw around her! Nora liked him even for his faults. That proud, frank, passionate Noel temperament of his, which many girls would have regarded with some fear and no little misgiving, exactly suited her West Indian prejudices and her West Indian ideal. His faults were the faults of a proud aristocracy; and it was entirely as a member of a proud aristocracy herself that Nora Dupuy lived and moved and had her being. A man like Edward Hawthorn she could like and respect; but a man like Harry Noel she could admire and love—if, ah if, he were only not a brown man! What a terrible cross-arrangement of fate that the one man who seemed otherwise exactly to suit her girlish ideal, should happen to belong remotely to the one race between which and her own there existed in her mind for ever and ever an absolutely fixed and irremovable barrier!

So Nora, too, lay awake all night; and all night long she thought but of one thing and one person—the solitary man she could never, never, never conceivably marry.

And Harry, for his part, thinking to himself, on his trampled pillow, at Savannah Garden, said to his own heart over and over and over again: 'I shall love her for ever; I can never while I live leave off loving her. But after what occurred yesterday and last night, I mustn't dream for worlds of asking her a third time. I know now what it was she meant when she spoke about the barrier between us. Poor girl! how very wild of her! How strange that she should think in her own soul a Dupuy of Trinidad superior in position to one of the ancient Lincolnshire Noels!'

For pride always sees everything from its own point of view alone, and never for a moment succeeds in admitting to itself the pride of others as being equally reasonable and natural with its own.

SOME PET LIZARDS.

BY CATHERINE C. HOPLY.

THOSE who live near commons and turf heaths may in the spring-time spy the lizards peeping cautiously out from among the weeds to court the sunshine after their winter's sleep; or, on a warm day, boldly flitting across the grass, but hiding again on the slightest alarm. Much may the amateur naturalist find to interest and amuse him in these tiny lizards; to admire also, for their colours are often very beautiful, their eyes bright and watchful, their form and actions anything but ungraceful. Among these native lizards, the Slow-worm (*Anguis fragilis*)

is included—the 'deaf adder' or 'blindworm,' as it is commonly but wrongly called. As a pet, *Anguis fragilis* has many recommendations. Small, clean, unobtrusive, inoffensive, and easily fed, are more than can be said of most pets: domestic qualifications which, indeed, may be extended to its little four-legged cousins, the British lizards, often found in the same habitat, and all of which can be caught and transferred to a large glass bowl with ease and satisfaction. One of the bell-shaped glasses with a perforated knob at the top answers capitally. Reversed and furnished with moss, turf, and sand, the hole serves for drainage, because water is indispensable for the lizards, and the moss and turf should be sprinkled occasionally. A stand into which the reversed glass fits can be purchased with it, and a large china plate completes the arrangement, which, with its pretty occupants, is an ornament for any window or conservatory.

By an accident, I soon discovered that a slow-worm—my first and then only pet reptile—requires water. Knowing that it fed on slugs, I was hunting in the garden, and at length found some small ones under a flower-pot saucer, and conveyed them undisturbed to a place in the cage. The slow-worm soon discovered the addition, but instead of selecting a slug for supper, began to lick the cold, damp saucer, putting out its tongue repeatedly, as if refreshed; and forthwith the saucer was reversed and filled with the beverage, which the little reptile soon lapped eagerly, continuing to do so for some minutes. After this discovery, fresh water was supplied daily. That little creature became quickly tamed, a fact which her history will easily explain.

'Do you want a live viper?' a friend in the Reading Room of the British Museum asked me, one day.

'A viper! Here?'

'Yes, a deaf viper. It was caught in Surrey last week. We had a field-day.'

My friend was a member of a Natural History Society, as was also the gentleman who had found the so-called 'viper.' His hobby being geology rather than zoology, he had been breaking and turning over fragments of rock in a sort of dell, when he had discovered the harmless little creature, which he—a scholarly man, by the way—would have immediately put to death, as a dangerous viper, had not my friend—also a learned man, though not versed in snakes—reserved it for me, and with much caution transferred it to a tin box. It was subsequently consigned to a bottle, and tightly corked until I could see it. My friend now promised me he would not put the 'deaf viper' to death, as his lady relatives were daily entreating him to do; and a few days afterwards, he shook out of its narrow prison on to my table—not a viper, but a feeble slow-worm, the poor little thing having had no food during those eight or ten days of captivity. No wonder, then, that the half-famished reptile grew easily reconciled to an improved home with fresh grass and moss

and other luxuries, and soon learned to recognise its preserver. Soon a companion was brought for it, one freshly caught and full of health and vigour. This one was not so easily reconciled to a glass house, and only by slow degrees would it allow itself to be taken up and handled.

Another year, my saurian family increased to nine, including all the three British species, and all living amicably together in one large bell-glass. I will not trouble my readers with the nine names by which the nine lizards were known in the domestic circle. Scientifically, they were *Anguis fragilis*, *Lacerta agilis*, and *Zootica vivipara*; the last so called from its giving birth to live young. *Anguis fragilis* also produces its young alive; or, as in the case of one of my own, in a membranous case or 'shell,' quite entire, but easily ruptured. The specific name *agilis* has been applied to the larger lacertine; but a more agile, swift, and flashing little creature than *Zootica vivipara* can scarcely exist; so that the true names of these three species of lizard are not; after all, so truly descriptive. *Zootica* is much smaller, and must have acquired its astonishing celerity protectively, the wee animal having no other safeguard than in flight. And its suppleness equals its activity. Caught and held in the closed hand so tightly that one almost feared to crush it, it would nevertheless turn itself round, or rather double itself completely back and escape the other way, where no outlet seemed possible; or between the fingers, where you least expected. It is extremely restless and timid, and less easily tamed than *lacerta*. One of my *zooticas* had a peculiar dread of being handled, and was so ever on the alert, watching my slightest approach, and looking up sideways out of one eye, and with its head on one side in such a bird-like manner, that it acquired the name of 'Birdie.' Birdie seemed guided by intellect more than any of the family; and the devices she practised in order to escape me, when she anticipated my intentions to get hold of her, were truly intelligent. She vanished somewhere, but presently you caught sight of one bright eye peeping up from the depths of the moss, as if saying: 'Ah, I know what you're up to!' Perhaps I did try to circumvent Birdie somewhat heartlessly, just to observe her manoeuvres. She would peep at me and watch me through the glass, when I was sitting far away and had no intention of going near; but at last she learned to stay in my open hand, and I sometimes suspected there was as much play as fear in her hiding.

The lizards were also thirsty little creatures, and eagerly refreshed their tongues by lapping the wet moss, until they learned to lap out of a saucer. The male *lacerta* is of a handsome iridescent green, pale and delicate on the throat and belly, and a rich dark colour on the back. *Lacerta* is easily tamed. It soon learns to settle itself comfortably in a warm hand, and is quite appreciative of caresses in the form of a gentle stroking with the finger. In intelligence, both species certainly rank above *Anguis fragilis*; they more easily recognise the voice and the owner of the voice, looking up when addressed in the peculiar tone which was reserved for lizard training.

A large and handsome female *lacerta* that lived in a smaller glass by itself, escaped one day, and fell out of the window near which it was placed. It must have sustained some internal injury, and had, no doubt, suffered from cold and terror during the two days and nights it was lost, until found on a neighbour's balcony. I had reason to suspect she would soon deposit eggs, but she grew gradually thin and feeble, refusing food, and was evidently suffering, though showing no outward appearance of injury. It exhibited a strong desire to climb against the side of its cage, or whatever upright surface it was near, and remain in a perpendicular position; or if it could find no such leaning-place, it threw up its head and thus held it, as if to relieve itself of some pain. Then, more and more it kept its eyes closed, or opened them only to seek some object against which it could rest in that perpendicular position. As winter approached, I allowed the little sufferer to lie on a table near the fire, and covered it over for warmth; but it never remained contented on the level. Though its eyes were usually closed, whenever I spoke to it in the peculiar tone with which it was familiar, it invariably opened them and came towards me. If it could not reach me, it would even jump from the table to my lap in order to gain its favourite perpendicular position on my dress, where it remained quiet until removed. It grew more and more feeble, until one could scarcely detect life in it, except in the effort to open its eyes and try to approach when I spoke to it, and this to the very last.

These little lizards are easily procured; and I trust the perusal of these memoirs may induce some kind and patient individual to try them as pets, when it will be found that their sense of hearing and intelligence is in no way exaggerated.

Lizards cast their skins at uncertain intervals during the summer, being greatly influenced by temperature. One very warm season, when they were much in the sunshine, mine changed their dress on an average once in three weeks. Some of the sloughs came off entire, even to the tips of the tiny, delicate fingers, like a perfect glove. Sometimes they were shed in fragments. The head shields are not regularly renewed with the skin, which was always reversed. *Anguis fragilis* on one occasion cast its skin entire and unversed, a very unusual occurrence. All begin at the mouth, as snakes do; and you will see when the process is about to commence by the little creatures rubbing their mouths and their heads against whatever they are near, the loosening enticel no doubt causing irritation. To watch the process is exceedingly interesting, especially when the lacertines free their limbs of the old garment, shaking off and dragging themselves out of it as you get off a tight sleeve.

A word about the voices of lizards, on which so much has been written. These do utter a sound is certain; but it is very feeble; though, perhaps, in comparison with their size, not more feeble than the hiss of a snake. And only when much disturbed and annoyed do they ejaculate even this little sound, which is as if you half pronounced and whispered the letter *t* or *th*. Sometimes it resembles *ts*, only audible when quiet prevails. Both the lizards and the

slow-worms expressed their displeasure by this same little expulsion of breath, scarcely to be called a hiss. But once when a slow-worm fell from a high stand to the floor, there was a singular sort of loud chirp or chuckle, as if the breath were forced suddenly from the lungs by the fall. It was wholly unlike its regular 'voice,' and was so remarkable, that if it had not been ejaculated simultaneously with the 'flop' on the carpet that announced 'Lizzie's' fall, I might have thought a young bird or a frog was in the room. The slow-worms often got out of their cage and fell to the floor, seeming to be none the worse; but only on this one occasion did I hear the breath escape so audibly.

Recommending them as pets, it is important to say that they all like a change of diet; and herein lies the chief difficulty of keeping them, except to those who have gardens or who live in the country. *Anguis fragilis* will content itself for a long period on worms, but these must be fresh; and it enjoys a slug or a small smooth caterpillar for a change. But the lizards are more fastidious, as is perhaps natural; for in their wild state they catch such insects as are in season, and have a choice of these. In the suburbs of London, I found them glad of such varieties as could be procured from the shrubs in a garden, or by digging; and small worms, caterpillars, spiders, or insects were in turn eagerly pounced upon. 'Birdie' was particularly quick in detecting a rarity and in being first to seize it. Flies are liked by the lizards, but not by the slow-worms, the latter preferring less dry food. Centipedes were rejected by common consent.

The difficulty of meeting the dietetic requirements of certain pets reminds me of another pair of lizards that in turn inhabited the bell-glass. These were brought from Brazil, and introduced to me by the name of *Taraquira Smith*. An *i* or two should perhaps terminate and dignify the latter name, to commemorate the particular Smith who bestowed it on *Taraquira*; but *Smith* is simple and practical; and the *Taraquira Smiths* was the name of my two little Brazilian lizards. The smaller one measured about eight inches from the snout to the tip of his slender tail; the larger one was ten or more inches in length. They are, however, less agreeable to handle than the previous pets, their tails being armed with very finely-pointed sharp scales in whorls. The lizards seem to know how to use this long tail protectively, having acquired a habit of retrogression, and when held, of backing out of the hand, as if with the intention of pricking or inconveniencing you with these sharp spines, which are thus converted into weapons of defence. When persistently held or detained, the pricking effect caused by this backward motion is by no means agreeable. For food, they were provided with a supply of a peculiar kind of cockroach, which infested the reptile house at the Zoological Gardens of London, near which I happened to reside; but my two little foreigners persistently declined them and any other equally tempting food. Indeed, the poor little *Smiths* were in such a feeble condition from exposure to cold during their transfer from the ship to their glass home, that the smaller one soon died.

On the voyage, they had been kept in a warm temperature; and at the Reptilium they have been preserved by artificial heat. It was December when mine arrived, and though in the daytime they could be made comfortable near the fire, during the night a regular heat could not be maintained; notwithstanding, at the risk of suffocating them, warm woollen wraps were folded round and over the glass, to keep the frosty air from them.

When the smaller *Taraguira* died, redoubled care was bestowed on the survivor, but unfortunately, we could not transfer the Brazilian climate to a London residence, and my *Taraguira Smith* only lived long enough to display that peculiar and yet not vicious instinct of letting you know that its tail was armed throughout its entire length with those sharp prickly scales.

One more lizard-pet deserves an obituary notice.

'I have a horned toad from Texas down at my office,' said an Ohio editor to me, when I was visiting in that State. 'Will you like to call in and see it, when you pass that way?'

The reader will surmise that a very short time elapsed ere I did 'pass that way,' and my friend the editor bade me welcome by beginning an immediate search for the 'horned toad,' which apparently was allowed the free run of the office. Has the reader ever been introduced into the office of a Western newspaper editor? A chaos of 'exchanges' is its principal characteristic. You wonder how one man in a lifetime, much less a week—this was the office of a weekly paper—could look over and 'scissors and clip' from that astonishing miscellany. However, the object now was to hunt up the toad, not news. Exchanges in compact piles and loose piles were moved from shelf to table and table to shelf; exchanges half-opened and unopened, exchanges already clipped and thrown under the spacious table; papers filed and papers not filed; books and magazines in vast piles to be reviewed; ink of all colours in bottles of all sizes, some full, some empty; penholders and pencils enough to kindle a fire; paper-knives, scissors, rulers, and clips anywhere but in their natural places; and as for manuscripts, advertisements, and advertising books—from the size of a bath-towel down to the daintiest card—not to mention samples and offerings presented to the influential man in order to win a good word in his paper (here is the office-boy with another armful by the mail just in), and 'copy' enough for six months' use scattered about! All these things were moved, lifted, separated, swept on one side and swept back again, turned over again and again; but no toad rewarded that amiable editor's search. 'Toads like damp,' I suggested, while offering my small aid in picking up a shower of literature which my friend scattered in his haste. 'The poor thing can scarcely feel comfortable among this wealth of information and so near the stove.'

'Well, it is an improvement on a boy's pocket, anyhow,' returned the erudite man. 'I rescued it from a boy who had been carrying it about in his pocket for a whole fortnight. His uncle, just from Texas, brought it for him to play with. It was here half an hour ago, for I saw it,' continued the editor, rummaging a shelf of exchanges

for the fourth time. 'It's half dead anyhow; for horned toads won't eat when they're caught. Do, pray, take a seat—Why, there he is!' and down on the floor, in a dusty corner behind a chair which the editor drew out for me, was a poor, pretty little saurian, with a pointed tail, and a cornet of spikes round its head, which gave it a quaint and decorated appearance.

'It is not a toad after all!' I ventured to explain; but belief in vernaculars is strong.

'Maybe it's a frog, then; there are horned frogs, too, in Texas.'

On a first glance, the reptile has somewhat the appearance of a frog or a toad (with the addition of a tail). Its body was broader for its length than is usual in lizards, and its head was short and flat, looking all the more so for the horny spines, which stood out like a frill. The poor little half-dead thing was too feeble to struggle, and too thickly coated with dust to display any other than mud colour. From its long fast, it was merely skin and skeleton, painfully concave beneath. I gladly accepted it from the editor; and on reaching home gave it a bath, letting it remain in the water, and douching it thoroughly, which seemed to invigorate it, as it tried to crawl out of the basin, and opened a pair of bright black eyes. Gradually, its markings and true colour appeared, and it turned out to be an exceedingly pretty iguanian lizard; but, as my friend the editor had with reason said, it is generally known in Texas as 'the horned frog' or 'the horned toad,' or scientifically, *Phrynosoma cornutum*.

It now already gave signs of recovery, and when placed on its back, could right itself, and even crawl, and was a quaint, pretty little creature, worth preserving. But a tremendous obstacle here arose. There were young ladies in the house, and had they known I had surreptitiously brought home a toad to 'sting them with its poisonous horns,' the consequences are too appalling to conjecture! Such a terrific creature of four and a half inches long, tail inclusive, to be introduced into the family circle! So Iguana and I kept our secret; and I slyly smuggled a large, empty flower-pot into my room, and lined it with fresh grass and a clump of turf from the garden, and had the pleasure of seeing the poor little stranger nestle in it with evident satisfaction. I got its mouth open and gave it water, which it swallowed readily; and by-and-by administered a few flies, one at a time, which it also swallowed; and at night it crept under the turf. Next day, it mockly swallowed more food and drink, similarly administered, and was so greatly strengthened as to try to climb up the side of the flower-pot, then standing in the sunshine. This great flower-pot and its inmate caused me continuous alarm. When any one was expected in my room, it was 'hidden' in all manner of places; but when there was no danger of interruption, it could stand on the window-ledge, fortunately hidden from outside view by a veranda beneath. And in this way Iguana lived for many days, during which it rapidly improved. It is not surprising that such reptiles do not eat in captivity. Their habit is to pursue insects, and swiftly too, or to pounce upon one that takes its fancy; and no half-dead fly or amputated spider thrown into its cage

would excite its natural instincts. But this queer little animal submitted to be fed in a ludicrous manner. Without much difficulty I got its mouth open; and after suspiciously swallowing the first mouthful, it took the second and third as passively as a baby fed with a spoon. In this way it ate four or six insects a day, varied by a few drops of water or the soft pulp of a grape.

When my visit in Ohio was terminated, Iguana was secretly packed in moss in a little flat box and put in my bag; and the huge empty flower-pot was left outside the window, to excite the wonder of the curions. The friends I next visited knew nothing of 'horned toads' and their 'venomous spines,' and all alarms were forestalled by my saying: 'I have such a pretty little animal up-stairs—a tame lizard which was given me at R.'—'Oh, do let us see it!' was the encouraging reply; and when duly presented in my palm, whatever natural shrinking the ladies might have felt, was over-ruled by the 'queer thing's' evident harmlessness and its undeniably pretty coat. And now it was made happy in a large birdcage with a carpet of turf and moss; and when placed in the sunshine, was—in unexaggerated language—'wild with delight.' My hopes were to feed and strengthen it for another week or two, by which time it might be safely consigned to a box and to hibernation. But—and it is sad to end this little history with a 'but'—there came at the beginning of November some very warm days, and the sun had so much power, that when the cage was placed in the window, *Phrynosoma* must have imagined itself back in Texas. Only twenty minutes elapsed, and when I looked again, it was gone! How it could have squeezed itself and its long spikes between the wires, surpasses comprehension; but gone it was!

Great was the commotion throughout the house. The square of grass plot which separated the house from the pavement, and the neighbours' front gardens, and the flights of steps leading to the street, and all the gratings, possible and impossible, were hunted over by the united family, neighbours included. Pavement, road, and cellars were carefully searched by my good-natured cousins, after, of course, every inch of the room itself had been well examined. We felt sure that the sunshine would have enticed it outwards, and we began to think poor little Iguana must have fallen a victim to some dog or cat, when one of the family, who had been out walking, came hurrying home exclaiming: 'Why, here's your lizard! I found it on the pavement wa-a-y up the street, with its mouth all bleeding!'

Strange that, in a public thoroughfare, it had escaped at all. Several of its horns were broken, and its mouth was wounded internally, giving evidence of a violent struggle against the wires of the cage. It must have partly pushed its head between them, and found difficulty in extricating itself, going sideways, and then falling from the window on to some iron bars beneath. The jaw and teeth on one side were much injured; for when, after this, I attempted to feed it, it struggled violently and swallowed nothing more.

It never regained sufficient energy to attempt

another escape, but always held its head sideways, as if stiff or in pain; and after four or five days, poor little *Phrynosoma cornutum* died, and was buried.

WHERE THE TRACKS LED TO.

IN FOUR CHAPTERS.—CHAP. III.

I don't know that I ever thought more closely or continually over any event in my life than I did over this queer meeting with Sam Braceby. There was too much of a coincidence about this matter; and my experience has been that coincidences do not happen unless there is something to bring them about. I could make nothing of it, however, and so set seriously to work in watching Mr Godfrey. But in this affair it seemed as though I was never to keep steadily on in any course, for on the very evening I was to begin my observations, I received a letter from Mr Thurles, asking me to call on him.

I found the merchant as harsh as before, and, in addition, a little inclined to be offensive; at anyrate, his banter on my want of success was particularly annoying to me. He did not seem able to say anything pleasantly, and his speech ended in his throwing down a number of letters and papers, and telling me that the utterer of the forged bills had been discovered; the man himself had escaped by the merest chance; but upon his lodgings being searched, there was found among his papers correspondence which proved that he was a friend of Mr Godfrey, from whom several letters, all on business matters—that is, relating to the borrowing of money—were found.

'It was not to be expected,' continued the merchant, 'that these letters would state in so many words that they meant to forge bills or break into houses; but there is quite enough to show the footing they were on, and to convince us, if any more conviction were needed, that they were both in the forgery.—Look over the papers, and see if you can get a hint from them.'

I saw the name of the man to whom the letters were addressed, and knew it as that of a young fellow who had borne a doubtful reputation, although he had never been in actual 'trouble.' He was certainly a dangerous companion for Godfrey Harleston. I took the papers, and left Mr Thurles with the belief that the step-son was in an awkward position. Hitherto, I had by no means been a believer in his guilt; but I was obliged to own that things were now looking much blacker against him. Knowing as much as I did, I determined on a different course of action. I resolved to make some inquiries, and, if necessary, spend some money among the associates of this newly discovered accomplice, some of whom I knew pretty well.

But again I was destined to be balked in my plans—in fact, it was the continual drifting about, which seemed to be our luck just now, which made this undertaking so different from any other on which I had ever been engaged. This time the interruption came from Long-necked Sam, who had never been out of my waking thoughts for any one quarter of an hour since

I had seen him in the public-house. I found that Sam was remanded on a serious charge, which, if proved, would probably secure him, in his own phrase, 'a life'; and he wished to see me at once. It was rather sharp work, as only a few days had elapsed since I saw him, and now he had been apprehended, had his first hearing, and been remanded. But I knew that the police were constantly looking after him, and that he was always doing something which required him to keep out of their way as much as possible.

He would be a very fresh detective who would slight such a summons, meaningless as it might appear, for in such a business you can never tell what is going to turn up. I went, and saw Sam, who looked serious enough. Just as a matter of form and civility, I began to say that I was sorry to see him there, and so on.

'Never mind that, Mr Holdrey,' said Sam; 'you may be sure I did not send for you to cry over spilt milk. I was sure to be "shopped" some time or another, although I must own I thought I should have had a little longer run. No; it isn't that; it's about that business of old Thurles.—You are working with the old fellow, are you not?'

This was a staggerer! If I had ever tried to keep a business quiet, this was the one. If I had been asked to name the job which had been completely kept from oozing out, I should have named this; and yet here was a notorious thief, a man who had nothing whatever to do with Thurles & Company, speaking confidently and correctly as to my share in the affair!

'Well,' I said, 'what then?' It was of no use denying it, as it was plain that Sam knew.

'The old man,' he continued, 'is employing you to find out who broke into his office; but not so much for that as to find out about some forged bills. Well, I know all about the hurglary, and pretty near all about the bills. The breaking-in was more in my way, as you know; but I could not do that without learning a good deal about the other.—Mr Holdrey, I have been badly used; the man who is deepest in the job has treated me shabbily, and means to act worse, I can see; so I must tell some one whom I can trust, and who will be honest with me. You know what my pals are, and that I cannot ask them, though some of them would be as true as the day; so I sent for you. Besides, you spoke up for me and helped me when you could get nothing by it. I would trust you for that good turn alone; and without it I would have trusted you, knowing your character. But I say again and again, there are not many who would have acted as you did. There's a reward out, on the quiet, for this robbery; you can get it through me.—You know my wife, don't you?'

I had seen her once or twice, and so I told him.

'Well, she has been badly used in this affair; so have I; but I meant the money for her—I did honestly, to take her away where she was not known, and no one could bring her convict husband up against her, after he was sent off to Portland. Now, all I ask is, will you see to her and the young one, and share the reward with them? I don't ask you to do anything which may seem in the least wrong,

but so far as you can, consistent with your character as a man, very different from me, help her—will you do it? And will you share what reward you get?'

I did not see that there could be much harm in promising this, and on my saying so, Sam was at once satisfied.

'Then here goes,' he said. 'These bills were forged by a friend of young Harleston—stepson to old Thurles, you know—but I am inclined to think the young fellow never got any of the money. He does not say so himself; but I have heard a little from others.'

He went on to tell me, in detail, what I had heard from Mr Thurles; but all this, he owned, was at second-hand; his own share did not begin till later. Mr Godfrey had found him out—how, Sam had no idea—and proposed an easy job to him, which was, of course, to enter the office and spoil the safe. The young man made no secret of his wish to get the bills into his possession—all the rest of the property found, Sam might keep for himself. 'And there was precious little worth having, I can tell you,' said the prisoner—'only a matter of seven or eight pounds. I fancied I should have a rare haul, and, if you will believe me, I took a big hag tied round me, on purpose to hold the money. However, I gave him the papers he wanted, honoureble, and in course expected him to act likewise in regard of my share. His game was to save himself in the first case, and then to get money from Mrs Thurles to buy off the people who, he pretended to her, had got the bills, and were threatening to give them up to the police.'

'Mrs Thurles! Why, that is the young fellow's own mother!' I exclaimed. 'You surely don't mean to say that he was going to play such a fraud on his mother?'

'It was not very nice, was it?' returned Sam. 'I don't pretend to any fine feelings; but when I heard his plan, I had half a mind to knock him down. But there was my wife and child to be thought of, so I simply let the matter go. Well, I know for a certainty he has had some money from her, and expects a good deal more directly. All he ever gave me was two pounds. Two pounds out of five, he said; when I know from Bill, the potman at the *Royal Blue*, that he asked the landlord if he could cash him a cheque for a hundred that very night. The landlord could not do it, so Bill didn't learn much more; but he saw the cheque was in a lady's writing. But without all that, where could he get a cheque for a hundred, except from Mrs Thurles? He's always worrying her. Why, he was on the business that night you met me at the public-house in the mews. He had not gone on there above five minutes, when you came in.'

Recollecting on what errand it was I found myself at the public-house in question, this bit of information seemed queerer than all that had gone before. It would have been so strange if I could have seen him and Sam together.

'He deceived me then,' continued Sam; 'and as I am hoaxed up here and can't help myself, he will deceive me again, and do me out of my lawful rights in respect of that money. So I mean to spoil him. What I have told you is the truth. I don't know whether you can do anything about the bills, as he neither forged them

nor passed them; but that he arranged the cracking of his governor's crib—everybody knows the speaker meant the breaking into this step-father's office—and had the best of what was got, is a fact, as you can call me as a witness upon. And I will tell you this, Mr Holdrey: I am a bad one, I own, and nearly all my 'sociates are bad uns too—they have all been in quod, and will all go there again; but none of us is worse than that young Harleston, and, in fact, very few of us are so bad.'

I was disposed to agree with him, and to think the worst of a young man who could cheat a fond mother so heartlessly. I felt that I would never believe in faces again; for if ever I saw a man who looked incapable of such conduct, young Godfrey Harleston was that person.

We had a long conversation after this, in which Sam arranged that his wife should meet me the next day; I was to write and tell her when and where—which I did directly after leaving the prison—then we were to go before a magistrate; the rest would be plain sailing.

Here, then, at last, I should be able to satisfy my employer; he would be proved to be right, and this business he had given me would be brought to a successful conclusion. I should make a handsome profit, and, as is always the case in such things, get credit for an immense amount of ability I had never shown. Yet I never felt so dissatisfied with anything in my life, and though all was now as clear as crystal, there was something in it which, like a wrong figure in a sum, would not fit.

I don't know what induced me to do it, but before going home, I went round by Thurlie & Company's office, where I waited to see Mr Picknell come out. I thought as he came towards me, alone and thoughtful, under the shade of a big black wall which was there, I had never seen a more disagreeable-looking fellow. I was in his way, so that he almost ran against me. What a start he gave, to be sure! As I could see by the light of a lamp, he staggered and turned ghastly pale for an instant; but he rallied quickly, and exclaimed, with something like a laugh: 'Ah!—David!'—he paused a moment before he uttered the name—'is that you? I declare you almost startled me.'

'Yes,' I said; 'you looked as if you had seen a ghost.'

'Ghost! It would take a good many ghosts to startle me,' he began; then at once changing his tone, continued: 'Well, have you found a fresh job, David? It is just now a bad time to be out of work.'

I made some answer, and could not help keeping my eyes closely on him. He noticed this; I was sure enough, of that, although he said nothing about it.

'Look in next week, David,' he went on. 'I will ask among my friends, and perhaps I may have something for you. Do not forget; this day week. Good-night.'

In a friendly manner, he went away, nodding and smiling, as much as to say he would bear me in mind; and I felt as strongly as I had ever felt anything in my life that he knew I was no messenger—that he knew I was a detective. From the first moment I had spoken to him, I had never felt confident as to his motives

for being so friendly, and now I was as certain of them as if he had told me plainly. Well, after all, that need not interfere with my making use of various hints he had given me, especially as they fitted in with what I now found to be the real state of the case. But I did not like him.

The end of my engagement was now, I considered, fairly in sight. In the morning, I should go with Sam's wife to the Mension House; young Godfrey would be arrested; I should get my two hundred and fifty of the reward; Sam's wife would have the same; and there would be an end of it all. This was a great deal of money for me to clear; but I could not feel pleased over it. I don't mean to say that I had any idea of giving up the job, now I had gone so far with it, or of refusing the reward; I was too old a bird for that; yet I could not wake up, as we may say, in the matter.

I was so absorbed in thinking of the change in my life I would make, and thinking, too, of the pleasure it would give Winny as well as myself, that I hardly noticed anybody or anything as I went along, and was so deep in thought, indeed, that I almost ran against two persons, as I turned into a quiet street which was a short cut towards my home. These persons were as interested in their conversation as I was in my reverie, for they seemed as startled as I felt myself to be. I began an apology with a smile; but the words and the smile at once died on my lips; and so with them. The girl was my Winny! my daughter, who had turned ghostly white when she recognised me; but it was her companion who had, I may say, petrified me. Little as I thought to see my Winny in company with a stranger, you may guess what I felt when I saw that stranger was—of all men in the world—Godfrey Harleston!

For the moment I could not believe my eyes; yet, as if by some magical vision, I recalled the night when I thought I had seen Winny in the crescent. I now knew I *had* seen her; and I recognised her companion as clearly as though I had seen him a hundred times over. Brief as was the glance I had had on that night of him, I knew him as being the same man to an absolute certainty.

Winny was the first to recover herself, although, by her colour coming and going as it did, I could see how unnerved she was. Turning to her companion, she said: 'This is my father, Godfrey.—It is very strange we should have met him at this moment, is it not?—Father, this is'—

'Silence, Winny!' I exclaimed. My voice had somehow turned so hoarse and harsh that it was not like my voice at all. 'I want no introduction here. You will come home with me, and I shall then be glad to hear an explanation of what'—I could not very well finish the sentence.

Winny turned pale; she had never been spoken to by me in such a manner in all her life.

'I trust, Mr Holdrey,' said the young man—and his tone was very pleasant—'you are not in any way displeased with—with your daughter; indeed, we were just agreeing to wait on you to-morrow morning'—

'Do not come, then!' I interrupted. I could

not help glancing at Winny, who looked as much astonished as frightened at hearing me speak like this, for I am not a rude man in general.

'I am sorry to hear you say so,' continued Mr Harleston. 'It is my fault, not Winny's, that we have not called on you long before. I have only waited to see some serious business settled which has troubled me a great deal. Yet now I think I was wrong. Let me walk home with you now.'

'No!' I said sternly—'no, sir! I shall take my daughter home; and as I wish to have no further argument in the street, I shall bid you good-night.'

The tears, which had been standing in Winny's eyes, had now overflowed, and were trickling down her cheeks. My heart ached, as I saw this; but I grew angry, too, at seeing her, instead of at once joining me, turn her pale face to him with an inquiring look, as though asking permission—asking permission of him to obey her father!

'Yes, Winny dear,' he said gently, 'you had better go. Your father does not understand all, and is naturally hurt; but I will see him to-morrow. Keep up a good heart, dearest!' And with that he bent his head and kissed her, she lifting her face without the least shyness or shame.

I took her arm, and without another word, led her away. I hailed an omnibus, and we got in. I did this on purpose that there might be no opportunity for argument or pleading until we reached home. When we did so, I quickly lit the gas, drew down the blinds, and so forth; while Winny, having taken off her bonnet and pelisse, stood as pale and motionless as a statue, leaning on the table in the middle of the room.

I never felt a greater difficulty in speaking than I did then; not only was my voice hoarse, but my throat seemed blocked; however, it had to be done. 'Winifred,' I said, 'I could not have believed it possible that you would have had an acquaintance unknown to me—and such an acquaintance! A man who!—I could not help hesitating here—what I had to say was so dreadfully unpleasant.'

'Father!' cried Winny—her voice was low but distinct; it was firmer than mine.—'Mr Godfrey Harleston is at least a friend of whom I need not be ashamed. I am not ashamed of him!'

'Poor silly girl!' I exclaimed; 'you will be only too soon!'

'Never!' she interrupted, in the same low firm tone.

'You little know what is before you,' I continued; 'and I only wish I had been aware of this intimacy earlier, to have saved you, perhaps, from some suffering. That young man is a suspected forger, and certainly an accomplice of burglars!—Hear me out, Winny! It will be best. I have been on his track for weeks, and at last all is brought home. I fear it will shock you to learn it, but he is a lost man; and in the morning I am under an engagement to apply at the Mansion House for a warrant for his arrest! There is no hope or chance for him; he will sleep in prison to-morrow night!'

I saw that Winny repressed a shriek by a great effort. For a moment a spasm convulsed her

features, which quite frightened me, and then, in a strange gasping voice, which had nothing in it like my Winifred's gentle tones, she cried, again clasping her hands tightly upon her breast: 'He a criminal! He to be thrown in prison by you—by you, father! Never! You know not what you are saying. Father, you are talking of my husband!'

A TALE OF NASEBY FIELD.

ABOUT four miles from Market-Harborough lies a little village, which we will call Bullenham. It is one of the most peaceful spots in all the peaceful Midlands. The houses are scattered here and there, divided from each other by orchards and farm-closes; one or two quiet shops supply the modest wants of the people; and several large farms provide the rude fathers of the village with labour. The old church, square-towered and gray, stands amidst the cottages. The curfew bell is still rung every night, and many another quaint custom survives the displacement of old-world life made all over England by modern manufactures and railways. The only disturbance to which the village is now liable is the invasion of its wide street and spacious green by foxhounds and scarlet-coated hunters, who, during the season, often meet there. But two centuries ago the village was invaded by the Cavalier army on its way from Harborough to Naseby, there to meet defeat at the hands of Fairfax and Cromwell and their undaunted Roundheads. The military events of that time, and the momentous national changes they effected, are familiar to every one; and as they form no part of our story, we shall not dwell on them; for on the edge of the splendid blazonry of history there are often homely incidents which this historian and philosopher reject, and it is such an event, full of domestic and human interest, that we propose to narrate.

A few days before the battle, a troop of Rupert's horse was holding the village of Bullenham, and, with wild riot and plunder, terrifying the hearts of the farmers and their wives. The post was of some importance, for it lay just half-way between Harborough, where King Charles was staying, and that wide moorland on which the Parliamentary army was manoeuvring. Nearly the whole of the Royalist soldiers passed through Bullenham, so that the villagers saw enough and to spare of the pomp and circumstance of war. The young officer who commanded the cavalry troop quartered in the village was named Henry Melford, and he had established himself in a small farmhouse. The household consisted of the farmer and his wife and one daughter, their only child. Captain Melford was not a rough soldier, but a refined man, accustomed to good society. At the same time, he had a delightfully frank manner, quick sympathies, and a homely naturalness and power of adaptation which went far to reconcile Dame Dimhelt to the invasion of

her household privacies and the subversion of all her established hours and methods. Her husband's talk was of oxen, and he took little interest in the questions that were then riving society to its centre. A stolid, characterless man, he rose with the dawn to go through his placid routine of occupations, and smoked his pipe in the chimney in the evening. The outdoor work of his small farm he managed almost entirely himself, while his wife and neat-handed daughter reigned inside the threshold. Barbara was a bright, plump, merry creature, who sang old ballads from morning till night, save when a snatch of some favourite church anthem broke in graver notes from her lips. She had lived in unwonted excitement since the soldiers had entered the village, and what mischief might have come about had she been allowed to yield to her own coquettish impulses it is hard to say. But Captain Melford had none of the licentiousness which characterised many of the Royalist soldiers: he had indeed something of the chivalrous purity of an olden knight, and he had not only warned Barbara against possible danger, but had made it well understood that the maiden was not to be approached by the soldiers. Consequently, the pretty damsel was comparatively safe; and honest John Sprayby, who for a year or two had been hovering about her, was not likely to be discarded for some bolder and lighter wooer.

One evening, after Captain Melford had received the reports of his sergeant, and had given orders for the various watches to be kept during the night, he began to take his ease in the spacious farm kitchen. The table was spread for supper, and he sat down to do hearty justice to the homely old English fare.

'Come, dame,' he cried, 'give me a draught of your home-brewed. 'Tis the best drink I have tasted since Prince Rupert gave me a stirrup-cup a week ago.—And what's this? By all that's good, a stuffed chine! Ah! this is better than all your court kickshaws, and will stay my stomach well if there should be any fighting to-morrow; and so saying, he laid at once a pound or so upon his plate and applied himself vigorously to its consumption. 'And where is your pretty daughter, Mistress Dimbell?' he asked after a time. 'Is she with her sweetheart? Ah, if you'll only wait until we've beaten these confounded Roundheads, I'll see that they get married. There's a certain fair lady breaking her heart over me now, and so I can feel for pretty Barbara in these wild times.'

'I'm sure your honour's very good,' said the farmer's dame; 'and I wish you were safe out of all this fighting, for I should be sorry to see you come by any hurt.'

Just then a loud knock shook the door, and going to it, Mrs Dimbell saw a trooper leading his horse. Both man and beast were covered with dust and sweat from hard riding. 'Is Captain Melford in?' he asked in a loud tone. Melford could not avoid hearing the question, for the kitchen opened directly on the road, and so he jumped up and hurried to the door.

'These for you, sir,' said the trooper respectfully on seeing the captain, and handed him a

large packet of papers. 'There are stirring times at hand, and we're going to have at Old Noll.'

'Ah!' said the captain, 'is that so? Well, come in, Radbourne, and eat something while I read these letters. You can tie your horse up to yonder tree; there is a sentinel will have an eye on him.'

'Thank your honour,' said the soldier: 'I shall be none the worse for a comfortable meal. We've been on the march since sunrise this morning, and I've tasted nothing but a pot of small beer since noonday.' Having fastened his horse's bridle to the tree, he soon seated himself at the table, where he made a mighty attack on the stuffed chine, and emptied almost at a draught the brown jug of ale.

While he was thus engaged, the captain was busy reading his despatches and writing a reply to one of them. When he was ready, he called the soldier, and said: 'Here, Radbourne; you must hurry back with all speed. Give this letter to the Prince, and say that all shall be done as he orders. You had better take your horse to the stable and rub him down and feed him, for it won't do to break down to-night. But don't delay starting, and keep your pistols loose.'

'All right, captain,' said Radbourne, as he prepared to carry out these directions, at the same time casting a fond look at the empty ale-jug.

The captain saw his glance, and said laughingly: 'Come, good Mistress Dimbell, get this thirsty soul another draught, and he shall drink it to your health when he's ready to start.'

When the trooper was gone, Captain Melford went to the door and whistled loudly, whereupon the sergeant of his troop came from a neighbouring cottage, and to him the captain gave certain orders, and then turned back to his interrupted supper. On entering the kitchen again, he found pretty Barbara Dimbell there, and seated in a corner was a rustic youth, who evidently, even in those exciting times, fondled in Barbara's smiles an attraction of the most potent kind. Melford greeted him with a friendly smile, for he had found considerable amusement in watching the unsophisticated courtship of these two blushing lovers.

Mrs Dimbell said to him: 'Come, sir, it's a shame you can't have a meal in peace; now, do sit down and finish.'

He looked graver than usual as he resumed his place at the table, and after a while said, almost as if he were speaking to himself: 'This may be my last meal; who knows? I and my men are to set off by cockcrow, and I fear we shan't all come back. Perhaps it's my turn this time.'

'Well, sir,' said the farmer's wife, 'every bullet has its billet, as the saying is; but don't be cast down. I hope we shall see you come riding back all right. But, God help us! these are bad times, when a man can't be sure of his own life, let alone the beasts as he has brought up and the crops he has reaped. There's our corn-stack has been carried half away this very week as ever was; and if it hadn't been for your honour speaking up, we should not have had a cow left; and as for Barbara and John coming together, why, it's my opinion as they'll have

to wait years before we can turn ourselves again.

The lovers looked up at this new view of things, and stared with undisguised dismay at each other.

But Captain Melford burst into a hearty laugh, and cried out: 'Nay, things are not so bad as that.—Cheer up, my little apple-blossom, and see if you don't get married before the year is out; and if I can't come and dance at your wedding, I'll send you something to remember me by.—But where is your husband, mistress, for I want to see him before I go to bed?'

The farmer, being called by his wife, made his appearance from one of the outhouses, where he had been attending to the wants of his cattle. He saluted the captain respectfully, and waited to hear what he had to say.

Beckoning them both into another room, the captain said: 'Dimbell, I've got orders to march early in the morning, as a big fight is expected to-morrow. Now, I want you and your good wife to take care of this money for me. There's nearly four hundred pounds in this bag, and it's too much to carry about, especially when a man may get an ugly knock that will settle him entirely. So do you put it in some safe corner; and if I come out of the fight all right, you shall give it me again, and I'll pay you well for what I've had here. But if I should be killed, you may keep the money for yourselves, and buy a bigger farm with it.'

'Well, sir,' said the farmer, 'I'm sure I'll do my best to keep it safe, and I hope as how you'll come back to claim it; for your honour has been a civil gentleman to us, and has kept us from being eaten up by them soldiers, and I'm sure we all wish you might come back safe.'

'Thanks, my good friends,' was the reply. 'And now I'll go to bed and get a few hours' sleep.'

The next morning he was up and away almost before the proverbial cockcrow. After his departure, Dimbell and his wife spent some time in searching for a secure hiding-place for the money intrusted to their care. That day, little work was done in the village, for the wild sounds of war came fitfully on the air as the incidents of the epoch-making battle of Naseby succeeded one another through the day. Some adventurous youths, who had followed the Royalist troops on their march, brought back fragmentary tidings of fierce strife and strange confusions, and of how they had seen the king's carriage, and the king himself sitting in it. As the afternoon wore away, tumultuous hands of men came hurrying through the village and made with all speed for Market-Harborough. Their numbers increased, until it became evident that the Royalist army was in full retreat. At last, when the main bodies of both horse and foot had passed, and only wounded stragglers were to be seen, there came riding into the village a compact body of stern horsemen, who speedily occupied every point of vantage and took prisoners all the Royalist soldiers they found. The post was now in the bands of the Parliamentary army, and it was not long before trembling and terrified Mistress Dimbell was bidden to prepare accommodation for two officers in her house. The next day, fresh dispositions

were made, and the village was left in comparative quiet, only a dozen soldiers remaining to prevent communications with the Royalist army.

The third day after, as John Sprayby was returning home from some rustic occupation in the dusk of the evening, he saw a strange figure crawling along under the shadow of the hedge. At first, it seemed like some beast; but as he drew nearer, he heard human groans proceeding from it. Evidently some wounded soldier was dragging himself painfully along, and John went towards him to see if he could render any help. He then saw that the poor man was crawling on his hands and one foot, the other foot being broken and crushed. Approaching still closer, he felt a shock of surprise and grief as he recognised Captain Melford.

'Why, Master Melford,' said he, 'is that you, sir? Oh! what a pity! Here, lean on me, sir; and the good-hearted John blubbered lustily as he knelt down, and strove to ease the poor man's pain.

The captain was so exhausted that he could hardly speak, but he held John's hand tightly as he said feebly: 'How far is it to Mistress Dimbell's? Are there any soldiers in the village?'

'Well, sir,' replied John, 'there's a few of 'em left; but there's none at Dimbell's now; so, if you would stop here a bit, I'll go and fetch somebody, and we'll make shift to get you there. Perhaps, if we take you the back way over the fields, none o' the soldiers'll see us.'

'Do, John,' said the wounded man; 'and I'll lie down here and stop quiet. But, for God's sake, don't be long, for I'm almost done.'

Upon this away went John, and soon returned with help enough to carry the wounded man to his old quarters in the farmhouse. The good dame and her daughter, who had prepared a bed immediately upon John's report, hastened to wash and roughly dress the wound, and to feed the famished and half-dead man. All night they watched and tended him, but in the morning he was evidently worse, and seemed sinking down to death. There was no surgical aid near, and they dare not let his presence be known, for fear of the soldiery. All day he lay in a kind of stupor, hardly noticing the presence of any one; but in the evening he revived a little, and could speak. He called the farmer to him, and said brokenly to him and his wife: 'My good friends, you've been very kind to me. I know I'm dying; you must be my heirs. Keep that money—the money I left with you. Let pretty Barbara get married. Tell John I thank him for bringing me here. I hope you'll prosper. I shall be gone soon. May God have mercy on my king, and on my country! I die willingly for them.'

After this, he conversed no more, but lay breathing heavily, with his eyes fixed, and acknowledging only by a touch the kind offices that were done him. About ten o'clock at night, the farmhouse door was flung rudely open, and a loud voice called for the master of the house. Hurrying forward, Dimbell found himself confronted by a Parliamentary officer, and saw that the house was surrounded by soldiers. The officer said: 'Whom have you got up-stairs? I

shall require you to answer for harbouring traitors. Come, show me the way.'

The farmer, with a sinking heart, showed the officer the room, and he entered noisily, crying: 'Come, come, who are you?'

The dying man, somewhat aroused, turned his glazing eyes towards the sound, but took no further notice.

'O sir,' said the farmer's wife, weeping and wringing her hands, 'I'm afeared as he's dying. Look at him, and you'll see as he can't be moved. O dear, O dear! Good gentleman, don't you touch him.'

The officer, like most men of his class, though stern and uncompromising in duty, was far from unkindly, and was a deeply religious man. In the presence of death, all differences were dwarfed, and common humanity asserted itself. He turned to the dying man with a subdued manner and grave inquiries. 'Ah! brother,' said he, 'this is an hour to prove the vanity of earthly things. I would fain ask if you have made your peace on high, and laid down your weapons of rebellion against the Divine Majesty? Bethink you that He is a God pardoning iniquity, transgression, and sin, and showing mercy unto all truly penitent souls. Look to the risen and glorified Mediator; for I am not one of those who would bid men fix their thoughts on Calvary, as if what was done there were still in course of being accomplished. But rest ye on a completed Atonement whereby thy peace is purchased for ever. Then thou shalt have no fear even in the gloomy valley.'

The dying man had recognised the officer as an opponent, and at first there had been a faint thrill of resistance to his words. But the tone was so sincerely kind, and there was such evident human interest and religious earnestness, that he accepted with a grateful look the exhortation addressed to him. No word passed his lips, but his eyes glanced upwards as if in silent prayer. The officer knelt down, and poured out with Puritan quaintness and fervour strong intercessions for the sufferer, praying that he might not fail of eternal glory. The awed farmer and his wife listened as to a strange tongue, and when the voice ceased Captain Melford was heard to say 'Amen.' They then saw one convulsive shudder pass through his frame, and all was over—Death had claimed his own.

What remains can be narrated briefly. The officer gave orders that the funeral should be conducted reverently; and on learning the name and rank of Captain Melford, undertook to communicate with his friends. After a time, the soldiers withdrew from the village, and its quiet life once more flowed into its former channels. John Sprayby and Barbara Dimbell were then married; and the old folks cautiously brought forward Captain Melford's legacy, and set up the young ones on a farm. 'It was the beginning of assured prosperity to them; and to this day their descendants, still bearing the name of Sprayby, are found on the same farm. The little village of Bullenham bears no trace of the rough edge of war which once descended upon it, nor do many even of the neighbours know how from the red soil of battle sprang the large and peaceful prosperity of the Sprayby family.

THE GORSE.

As I lingered at the window,
Weary of the summer heat,
Looking out upon the shadows
Of the now deserted street,
Came with gleam of yellow blossoms
Scattered memories faintly glad,
Wakened by the gorse and heather
In the cap of country lad.

Ah! the moor, horizon-bounded,
With its wealth of blossom-gold;
Ah! the reach of swelling upland,
Boulder-dotted, bare and cold;
Ah! the sweep across the bracken
Of the breezes, wild and free,
Bringing from the land of sunrise
Distant murmurs of the sea.

In the grayness of the dawning,
Ere the sun had taged the deep
With the glory of his coming,
And the hills were yet asleep,
Merrily we pressed the heather
As we went towards the sea,
For the world was all before us,
And the day was yet to be.

There we planned a noble future;
As the heralds of the light
Bearing messages of succour
To the children of the night.
We would face the world together,
Fight the evil hand in hand,
As the knights in ancient legend
Slew the tyrants of the land.

Thus we dreamed, and thus we purposed
With the eager hearts of youth,
And we gathered yellow blossoms
As the emblems of our truth;
For the ridicule and scoffing
Would be thorns upon our way,
But the gold of love would sweeten
All the labours of the day.

But our dreaming never deepened
Into deeds of hero might;
For the Shadow Angel beckoned
At the coming of the night.
One obeyed the spirit-summons,
And the waking comrade wept,
While the darkening mists of sorrow
O'er the plains of morning crept.

Through the summer and the winter,
Through the sunshine and the cold,
Evermore the gorse is blooming,
Crowning all the heath with gold;
And a toiler in the city
Dreams of moments grave and glad
As he sees the sprig of heather
In the cap of country lad.

THE GERMANISATION OF AMERICA.

THOSE who know any part of America, or have even a small acquaintance with Americans, will not have been surprised at the list of names published in the daily papers of the persons who were arrested as the authors of the late disturbance at Chicago. With perhaps one exception, there is not an English name among them; they are all foreign, and to the true American public, must bring home in full force the certain operation of a process hitherto only half apparent—that their country is fast passing through a period of incubation, which, if allowed to continue, will end in the development of a new Germanism, destroying the individuality of the Anglo-Saxon, and flooding the land with theories for the relief of an Old World discontent.

Before steamships and railways had made travel a matter of comparative ease, it was customary to laugh at the peculiarities of our American cousins, in the belief they were the result of the natural growth of transatlantic life; but a wider knowledge of the continent has brought to light the indisputable fact that they are to a very considerable extent the habits and customs of the lower middle class of Germany. The true American, taking into consideration difference of thought, is as much a gentleman, from the English point of view, as the Englishman himself. If there is anything which characterises an Englishman, as distinct from the rest of his species, it is his sensitiveness on the point of similarity to his kind, and his willingness in carrying this out, to submit himself to personal inconvenience, rather than allow any singularity to appear. Where this comes in, the American does not bow to the same strict conventional rule, his constant activity and the dissimilitude of life having of necessity forced him to take circumstances into account. Laying aside the distinction, however, and it is one which does not always intrude itself, making allowances also for a greater conservatism which has retained

old English customs and expressions, where is the line to be drawn in cultivated circles between an Englishman and an American? If, also, we look into the great upper middle classes of the two countries, who will grant that the dead level of uniformity in England is more attractive in its outward than its inward form; and who will doubt that for the pleasure of intercourse, the advantage is wholly on the side of America both as regards originality of thought and freedom from restraint?

The juvenile republican of Europe, panting on the outskirts of exclusivism, makes a great mistake when he imagines America is free from 'class' prejudice. Let him emigrate to a house on the wrong side of Boston, and we can promise he will have leisure during the remainder of his life to calculate the difference in degree between the descendants of those whose patent of nobility bears the date of the *Mayflower* and the representatives in the Old World of Norman blood. In the present day, we take it for granted the society of every country is willing to welcome the man of genius or money who is, besides, a gentleman, and does not run his head against established facts. Be that as it may, there is one thing certain—the old idea of Americans, considered typical of the race, and still lingering in some quarters, is entirely an error.

Let us look at a few of the supposed characteristics of our 'cousins'—one and all taken from the travelling citizen of other days, but who latterly has faded into the background before the true American, and is only now to be seen in second-class hotels or lodgings. Does he ask interminable questions with the curiosity of an inquisitor, till nothing remains but a point-blank demand to know the amount of your income? If so, engage rooms in a German *pension*, and relate your experiences after a three days' stay. Does he worry you to death with a skilful display of the knife-trick? Go to a German pastry-cook's and watch the same performance at four o'clock in the afternoon by a well-dressed young lady on a solid pie. Does he smoke everywhere

and spit freely? Enter a Paris tramway car or a second-class German railway carriage, and you will learn that Uncle Sam has not the monopoly of expropriating power. Does his square-cut coat hang upon him like a sack? Does he wear shirt fronts and glazed cuffs, long boots with high heels, and a hat whose style has originated in his inner bosom? If you have observed these things, go to any small German town and see their prototypes. Does he destroy his digestion by drinking iced water as he sits down to dinner? Does he eat a heavy meal in the middle of the day and hurry off as if the table were let? Does he brag like a schoolboy and believe that existence centres in himself? If he does, make the acquaintance of the first German at the nearest watering-place. Does he, in his native town, when aspiring to a higher place in the respect of the citizens, turn himself quite inside out in the effort to be agreeable? Does he take his hat off to the man of distinction with a wide wave, forgetful of his own dignity, eyeing him with suppressed jealousy, and when he dares, endeavouring to patronise, as a means of recommending himself to notice, the realisation of *ich empfehl' mich* which is shot out occasionally, more especially in Austria? If so, study the German character in the lower middle class. Is this class, however, making all allowance for humanity, morally sound, and is it the same in the United States? We answer unhesitatingly, 'Yes,' though perhaps in Europe it ought to be limited to Northern Germany. We would also affirm that the men in both countries are intellectually decidedly above their customs or their manners; while the women ripen early, and have a natural vivacity added to good appearance, which supplies the want of a corresponding culture.

It would be easy to multiply questions proving the origin of supposed Americanisms; and indeed, the better classes are more tinged with continental ways than they might care to admit, as, for instance, the 'Pap-a' and 'Mam-ma' of well-born babies; or the Mrs Colonel and Mrs Dr So-and-so, like the Frau Pastor or Frau Doctor of Gernsny; but we have only desired to show how the foundation has been almost unconsciously laid for the naturalisation of European customs, and, as a consequence, of thought also, so that what is called American is really German. These ideas have been carried to America, of course, by the tide of emigration; and as the population grew out of the emigrants of all nations, native manners were partially lost by the lower orders.

That America should be more Germanised than Irishised or Frenchified, is a tribute to the higher qualities of the Teuton; and that a certain class of Americans could become so transformed from its original type, only tells how completely it has been absorbed, and how far away it already is from the Anglo-Saxon race. That this is a matter of grief to all true Americans, is well known; and it is always said, whenever a case comes up, the man in question is a 'German American.' The tenacity of the Teuton has preserved his individuality under foreign conditions, and he now forms a distinctly powerful element in the country, lives the same way as if he were in Germany, thinks the same thoughts, and clings to his language. The

American, true to trade instincts, has studied his wants and ministered to them, as, for example, in the consumption of Rio coffee, so that in a way he is responsible for the fostering of nationalities. Societies, too, representing these, formed on philanthropic grounds, everywhere exist; and though the man may call himself American, he is in reality partly Irish, Swiss, or Dutch.

There is, therefore, a hard task before the American people—the necessity to weld into an harmonious whole European elements with long histories of animosity to each other, at all times more or less active, possessing Old World grievances that are inoperative in the United States, and bent upon maintaining their own ideas under the shelter of a common home. That measures will be taken to suppress the disturbances of divers nationalities whenever they occur against the American people, there is no doubt; but it is rather hard upon a new country to have to submit up to fighting-point to the airing of doctrines which do not affect it, and that might create artificial grievances causing endless trouble. In the attempt to banish national distinctions, to develop the Anglo-Saxon race, America has a firm friend here; and just as her truest sons, when desirous of looking beyond themselves, turn for their inspirations to the genius of the British people, so do we in return take a leaf from that chapter of events in the progress of humanity which it seems to be the mission of Americans to arrange.

IN ALL SHADES.

CHAPTER XXXVII.

TWILIGHT, the beautiful serene tropical twilight, was just gathering on Wednesday evening, when the negroes of all the surrounding country, fresh from their daily work in the cane-pieces, with cutlasses and sticks and eudgels in their hands, began to assemble silently around Louis Delgado's hut, in the bend of the mountains beside the great clump of feathery cabbage-palms. A terrible and motley crowd they looked, bareheaded and bare of foot, many of them with their powerful black arms wholly naked, and thrust loosely through the wide sleeve-holes of the coarse sack-like shirt which, with a pair of ragged trousers, formed their sole bodily covering. Most of the malecontents were men, young and old, sturdy and feeble; but among them there were not a few fierce-looking girls and women, plantation hands of the wildest and most unempt sort, carelessly dressed in short ragged filthy kirtles, that reached only to the knee, and with their woolly hair tangled and matted with dust and dirt, instead of being covered with the comely and becoming bandana turban of the more civilised and decent household negroes. These women carried cutlasses too, the ordinary agricultural implement of all sugar-growing tropical countries; and one had but to glance at their stalwart black arms or their powerful naked legs and feet, as well as at their cruel laughing faces, to see in a moment that if need were, they could

wield their blunt but heavy weapons fully as effectively and as ruthlessly in their own way as the resolute, vengeful men themselves. So wholly unsexed were they, indeed, by brutal field-labour and brutal affections, that it was hard to look upon them closely for a minute and believe them to be really and truly women.

The conspirators assembled silently, it is true, so far as silence under such circumstances is ever possible to the noisy demonstrative negro nature; but in spite of the evident effort which every man made at self-restraint, there was a low undercurrent of whispered talk, accompanied by the usual running commentary of grimaces and gesticulations, which made a buzz or murmur hum ceaselessly through the whole crowd of five or six hundred armed semi-savages. Now and again the women especially, looking down with delightful anticipation at their newly whetted cutlasses, would break out into hoarse ungovernable laughter, as they thought to themselves of the proud white throats they were going to cut that memorable evening, and the dying cries of the little white pickaninnies they were going to massacre in their embroidered lace bassinettes.

'It warm me heart, Mistah Delgado, sah, one white-haired, tottering, venerable old negro mumbled out slowly with a pleasant smile, 'to see so many good neighbour all come together again for kill de buckra. It long since I see fine gadering like dis. I mind de time, sah, in slavery day, when I was young man, just begin for to make lub to de le-adies, how we rise all together under John Tre-lawney down at Star-Apple Bottom, go hunt de white folk in de great insurrection. Ila, dem was times, sah—dem was times, I tellin' you de trut', nie fren', in de great insurrection. We beat de goomba drum, we go up to Mistah Pourtales—same what flog me mudder. A merciful dat de buckra judges even fine him—an' we catch de massa himself, an' we beat him dead wit stick an' cutlass. Ila, ha, dem was times, sah. Den we catch de young le-adies, an' we hack dem all to pieces, an' we burn de bodies. Den we go on to odder house, take all de buckra we find, shoot some, roast some same we roast pig, an' burn some in deir own house. Dem was times, sah—dem was times. I don't s'pose naygur now will do like we do when I is young man. But dis is good meeting, fine meeting: we cry "Colour for colour," "Buckra country for us," an' de Lard prosper us in de work we hab in hand! Hallelujah!'

One of the women stood listening eagerly to this thrilling recital of early exploits, and asked in a hushed voice of the intensest interest: 'An' what de end ob it all, Mistah Corella? What come ob it? How you no get buckra house, den, for yourself lib in?'

The old man shook his head mournfully, as he answered with a meditative sigh: 'Ah, buckra too strong for us—too strong for us altogether; come upon us too many. Colonel Macgregor, him come wit plenty big army, gun an' bay-net, an' shoot us down, an' charge us ridin'; so we all frightened, an' run away hide in de bush right up in de mountains. Den dem bring Cuban bloodhound, hunt us out; an' dem hab court-martial, an' dem sit on Tre-lawney, an' dem hang him, hang him dead, de buckra. An' dem hang

plenty. We kill twenty—twenty-two—twenty-four buckra; an' buckra kill hundred an' eighty poor naygur, to make tings even. For one buckra, dem kill ten, fifteen, twenty naygur. But my master hide me till martial law blow ober, because I is strong, hearty young naygur, an' can work well for him down in cane-pieca. Him say: "Don't must kill valuable property!" An' I get off dat way. So dat de end ob John Tre-lawney him rebellion.'

If the poor soul could only have known it, he might have added with perfect truth that it was the end of every other negro rebellion too; the white man is always too strong for them. But hope springs eternal in the black breast as in all others, and it was with a placid smile of utter oblivion that he added next minute: 'But we don't gwine to be beaten dis time. We too strong ourselves now for de soldier an' de buckra. Delgado make tings all snug; buy pistol, drill naygur, plan battle, till we sure ob de victory. De Lard wit us an' Delgado him serbant.'

At that moment, Louis Delgado himself stepped forward, erect and firm, with the unmistakable air of a born commander, and said a few words in a clear low earnest voice to the eager mob of armed rioters. 'Me fren', he said, 'you must obey orders. Go quiet, an' make no noise till you get to de buckra houses. Don't turn aside for de rum or de trash-houses; we get plenty rum for ourselves, I tellin' you, when we done killed all de buckra. Don't set fire to de house anywhere; only kill de male white folk; we want house to lib in ourselves, when de war ober. Don't burn de factories; we want factory for make sugar ourselves when de buckra dribben altogether clean out ob de country. Don't light fire at all; if you light fire, de soldiers in Port-ob-Spain sec de blaze directly, an' come up an' fight us hard, before we get together enough black men to make sure ob de glorious victory. Nebber mind de buckra le-ady; we can get dem when we want dem. Kill, kill, kill! dat is de watchword. Kill, kill, kill de buckra, an' de Lard delibber de rest into de hands ob his chosen people.' As he spoke, he raised his two black hands, palm upwards, in the attitude of earnest supplication, towards the darkening heaven, and flung his head fervently backward, with the whites of his big eyes rolling horribly, in his unspoken prayer to the God of battles.

The negroes around, caught with the contagious enthusiasm of Delgado's voice and mutely eloquent gesture, flung up their own dusky hands, cutlasses and all, with the self-same wild and expressive pantomime, and cried aloud, in a scarcely stifled undertone: 'De Lard delibber dem, de Lard delibber dem to Louis Delgado.'

The old African gazed around him complacently for a second at the goodly muster of armed followers, to the picked men among whom Isaac Pourtales was already busily distributing the pistols and the cartridges. 'Are you ready, me fren's?' he asked again, after a short pause. And, like a deep murmur, the answer rang unanimously from that great tumultuous black mass: 'Praise de Lard, sah, we ready, we ready!'

'Den march!' Delgado cried, in the loud tone of a commanding officer; and suiting the action to the word, the whole mob turned after him

silently, along the winding path that led down by tortuous twists from the clump of cabbage-palms to the big barn-like Orange Grove trash-houses.

With their naked feet and their cat-like tread, the negroes marched along far more silently than white men could ever have done, toward the faint lights that glamed fitfully beyond the gully. If possible, Delgado would have preferred to lead them straight to Orange Grove house, for his resentment burnt fiercest of all against the Dupuy family, and he wished at least, whatever else happened, to make sure of massacring that one single obnoxious household. But it was absolutely necessary to turn first to the trash-houses and the factory, for rumours of some impending trouble had already vaguely reached the local authorities. The two constables of the district stood there on guard, and the few faithful and trustworthy plantation hands were with them there, in spite of Mr Dupuy's undisguised ridicule, half expecting an insurgent attack that very evening. It would never do to leave the enemy thus in the rear, ready either to attack them from behind, or to bear down the news and seek for aid at Port-of-Spain. Delgado's plan was therefore to carry each plantation entire as he went, without allowing time to the well-affected negroes to give the alarm to the whites in the next one. But he feared greatly the perils and temptations of the factory for his unruly army. 'Whatebber else you do, me fren's,' the old African muttered more than once, turning round beseechingly to his ragged black followers, 'doan't drink de new rum, an' doan't set fire to de bukra trash-houses.'

At the foot of the little knoll under whose base the trash-houses lay, they came suddenly upon one of the faithful field-hands, Napoleon Floreal, whose fidelity Delgado had already in vain attempted with his rude persuasions. The negroes singled him out at once for their first vengeance. Before the man could raise so much as a sharp shout, Isaac Pourtales had seized him from behind and gagged his mouth with a loose bandana. Two of the other men, quick as lightning, snatched his arms, and held them bent back in a very painful attitude behind his shoulders. 'If you is wit us,' Delgado said, in a hoarse whisper, 'lift your right foot, fellah.' Floreal kept both feet pressed doggedly down with negro courage upon the ground. 'Him is traitor, traitor!' Pourtales muttered, between his clenched teeth. 'Him hab black skin, but white heart. Kill him, kill him!'

In a second, a dozen angry negroes had darted forward, with their savage cutlasses brandished aloft in the air, ready to hack their offending fellow-countryman, into a thousand pieces. But Delgado, his black hands held up with a warning air before them, thundered out in a tone of bitter indignation: 'Doan't kill him!—doan't kill him! My children, kill in good order. Dar is plenty bukra for you to kill, witout want to kill your own brudder. Tie de han'kercher around him mout, bind rope around him aru an' leg, an' throw him down de gully yonder among de cactus jungle!'

As he spoke, one of the men produced a piece of stout rope from his pocket, brought for the very purpose of tying the 'prisoners,'

and proceeded to wind it tightly around Floreal's body. They fastened it well round arms and legs; stuffed the bandana firmly in his mouth so as to check all his futile attempts at shouting, and rolled him over the slight bank of earth, down among the thick scrub of prickly cactus. Then, as the blood spurted out of the small wounds made by the sharp thorns, they gave a sudden low yell, and burst in a body upon the guardians of the trash-houses.

Before the two black policemen had time to know what was actually happening, they found themselves similarly gagged and bound, and tossed down beside Napoleon Floreal on the prickly cactus bed. In a minute, the insurgents had surrounded the trash-houses, cut down and captured the few faithful negroes, and marched them along unwillingly in their own body, as hostages for the better behaviour of the Orange Grove house-servants.

'Now, me fren's,' Delgado shouted, with fierce energy, 'down wit de Dupuys! Wa gwine to humble de prond white man! We must hab blood! De Lard is wit us! He haf put down de mighty from deir seats, an' haf exalted de lowly an' meck!'

But as he spoke, one or two of the heaviest-looking among the rioters began to cast their longing eyes upon the unbreached hogsheds. 'De run, de run!' one of them cried hoarsely. 'We want snifin for keep our courage up. Little drop o' rum help naygur man well to humble de bukra.'

Delgado rushed forward and placed himself resolutely, pistol in hand, before the seductive hogsheds. 'Whoebber drink a drop ob dat rum dis blessed ebenin', he lissed out angrily, 'before all de Dupuys is lyin' cold in deir own houses, I shoot him dead here wit dis very pistol!'

But the foremost rioters only laughed louder than before, and one of them even wrenched the pistol suddenly from his leader's grasp with an unexpected side movement. 'Look hyar, Mistah Delgado,' the man said quietly; 'dis risin' is all our risin', an' wa has got to hab voice ourselbes in de partickler way we gwine to manage him. We doan't gwine away witout de rum, an' we gwine to break just one little pickanie hogshhead.' At the word, he raised his cutlass above his head, and lunging forward with it like a sword, with all his force, stove in one of the thick cross-pieces at the top of the barrel, and let the liquor dribble out slowly from the chink in a small but continuous trickling stream. Next moment, a dozen black hands were held down to the silent rill like little cups, and a dozen dusky mouths were drinking down the hot new rum, neat and unalloyed, with fierce grimaces of the highest gusto. 'Ha, dat good!' ran round the chorus in thirsty approbation: 'dat warn de naygur's heart. Us gwine now to kill de bukra in true earnest.'

Delgado stood by, mad with rage and disappointment, as he saw his followers, one after another, scrambling for handful after handful of the fiery liquor, and watched some of them, the women especially, reeling about foolishly almost at once from the poisonous fumes of the unrefined spirit. He felt in his heart that his chances were slipping rapidly from him, even before the

insurrection was well begun, and that it would be impossible for a crowd of half-drunken negroes to preserve the order and discipline which alone would enable them to cope with the all-puissant and regularly drilled white men. But the more he stormed and swore and raved at them, the more did the greedy and uncontrolled negroes, now revelling in the unstinted supply, hold their hands to the undiminished stream, and drink it off by palmfuls with still deeper grunts and groans of internal satisfaction. 'If it doan't no hope ob conquer de island,' the African muttered at last with a wild Guinea oath to Isaac Pourtales, 'at anyrate we has time to kill de Dupuys—an' dat always some satisfaction.'

The men were now thoroughly inflamed with the hot new rum, and more than one of them began to cry aloud: 'It time to get to de reg'lar business.' But a few still lingered lovingly around the dripping hog's-head, catching double handfuls of the fresh spirit in their capacious palms. Presently, one of the women, mad with drink, drew out a short pipe from her filthy pocket and began to fill it to the top with raw tobacco. As she did so, she turned tipsily to a man by her side and asked him for a light. The fellow took a match in his unsteady fingers and struck it on a wooden post, flinging it away when done with among a few small scraps of dry trash that lay by accident upon the ground close by. Trash is the desecrated refuse of cane from which the juice has been already extracted, and it is ordinarily used as a convenient fuel to feed the crushing-mills and boil the molasses. Dry as tinder, it lighted up with a flare instantaneously, and raised a crackling blaze, whose ruddy glow pleased and delighted the childish minds of the half-drunken negroes. 'How him burn!' the woman with the pipe cried excitedly. 'Sposin' we set fire to de trash-house! My heart, how him blaze den! Him light up all de mountains! Burn de trash-house! Burn de trash-house! Dat pretty for true! Burn de trash-house!'

Quick as lightning, the tipsiest rioters had idly kicked the burning ends of loose trash among the great stacked heaps of dry cane under the big sheds; and in one second, before Delgado could even strive in vain to exert his feeble authority, the whole mass had flashed into a single huge sheet of flame, rising fiercely into the evening sky, and reddening with its glow the peaks around, like the lurid glare of a huge volcano. As the flames darted higher and ever higher, licking up the leaves and stalks as they went, the negroes, now fairly loosed from all restraint, leaped and shrieked wildly around them—some of them half-drunken, others absolutely reeling, and all laughing loud with hideous, wild, unearthly laughter, in their murderous merriment. Delgado alone saw with horror that his great scheme of liberation was being fast rendered ultimately hopeless, and could only now concentrate his attention upon his minor plan of personal vengeance against the Dupuy family. Port-of-Spain would be fairly roused by the blaze in half an hour, but at least there was time to murder outright the one offending Orange Grove household.

For a few minutes, helpless and resourceless, he allowed the half-tipsy excited creatures to

dance madly around the flaring fire, and to leap and gesticulate with African ferocity in the red glare of the rapidly hurning trash-house. 'Let den wear out de rum,' he cried bitterly to Pourtales. 'But in a minute, do Dupuys gwine to be down upon us wit de constables an' de soldiers, if den doan't make haste to kill dem beforehand.'

Soon the drunken rioters themselves began to remember that burning trash-houses and stealing rum were not the only form of amusement they had proposed to themselves for that evening's entertainment. 'Kill de buckra!—kill de buckra!' more than one of them now yelled out fiercely at the top of his voice, brandishing his cutlass. 'Buckra country for us! Colour for colour! Kill dem all! Kill de buckra!'

Delgado seized at once upon the slender opportunity. 'Me frens,' he shrieked aloud, raising his palms once more imploringly to heaven, 'kill dem, kill dem! Follow me! Hallelujah! I gwine to lead yôu to kill de buckra!'

Most of the negroes, recalled to duty by the old African's angry voice, now fell once more into their rude marching order; but one or two of them, and those the tipsiest, began to turn back wistfully in the direction of the little pool of new rum that lay sparkling in the glare like molten gold in front of the still running hog's-head. Louis Delgado looked at them with the fierce contempt of a strong mind for such incomprehensible vacillating weakness. Wrenching his pistol once more from the tipsy grasp of the man who had first seized it, he pointed it in a threatening attitude at the head of the foremost negro among the recalcitrant drunks. 'Dis time I tellin' you true,' he cried fiercely, in a tone of unmistakable wrath and firmness. 'De first man dat take a single step nearer dat liquor, I blow his brains out!'

Reckless with drink, and unable to believe in his leader's firmness, the foremost man took a step or two, laughing a drunken laugh meanwhile, in the forbidden direction, and then turned round again, grinning like a baboon, toward Louis Delgado.

He had better have trifled with an angry tiger. The fierce old African did not hesitate or falter for a single second; pulling the trigger, he fired straight at the grinning face of the drunken renegade, killing him instantaneously. He fell like a log in the pool of new rum, and reddened the stream even as they looked with the quick crimson flow.

Delgado himself hardly paused a second to glance contemptuously at the fallen recalcitrant. 'Now, me frens,' he cried firmly, kicking the corpse in his wrath, and with his eye twitching in a terrible fashion, 'whoebber else disobeys orders, I gwine to shoot him dead dat very minute, same as I shoot dat good-for-nuffin disobedient naygur dar! We has got to kill de huckra to-night, an' ebbery man ob you must follow me now to kill dem mediatly. De Lard delibber dem into our hand! Follow me, an' colour for colour!'

At the word, the last recalcitrants, awed into sobriety for the moment by the sudden and ghastly death of their companion, turned trembling to their place in the rude ranks, and began once more to march on in serried order after

Louis Delgado. And with one voice, the tumultuous rabble, putting itself again in rapid motion towards Orange Grove, shrieked aloud once more the terrible watchwords: 'Colour for colour! Kill de buckra!'

VISITS TO THE ZOO.

THE LION-HOUSE.

We are glad to observe that in spite of the general depression in trade and agriculture, and the many counter-attractions for pleasure-seekers which have sprung up in and around London in recent years, the Zoological Gardens, Regent's Park, still maintain their popularity with the British public. On Easter-Monday, no fewer than thirty-one thousand visitors paid at the gates; thus clearly proving that the love of natural history is not dying out among us. An expedition to the Zoo is always the more pleasant when we are accompanied by the young, eager to compare the Jumbos and tigers of their Noah's Ark and picture-book with the living realities to be seen in the Society's collection. But there are others besides our children who may gain a useful knowledge in natural history by a stroll through the Zoological Gardens; and one hopes for a still more profitable effect in the ideas of many; for when studying the structure, the form, and the habits of even the meanest of creatures, it is hardly possible for the reflective mind to resist feeling a sense of the power and wisdom of the Creator.

Before speaking individually of the many interesting animals to be seen in the Zoological Gardens, it is right to point out, for the benefit of the uninitiated, or to those who have never visited a foreign land, and consequently have not had the opportunity of seeing wild creatures in a state of nature, that though the great majority of the prisoners we see there doubtless give a true idea of their habits when roaming in their native jungles, yet many of the quadrupeds, more especially those bred in the Gardens, cannot altogether be relied upon in this respect; for instance, many of the bears from the Himalaya Mountains, or other cold climes, which, we know, hibernate during the depth of winter, are unable to indulge in their lengthened sleep from force of circumstances. There are no hollow trees or snug caves wherein to curl up comfortably and pass the winter in a state of somnolence. Again, it is often most difficult, if not impossible, to provide the natural food for some of the creatures from tropical countries, and these animals have of necessity to subsist upon whatever their keeper places before them, and that sometimes of a kind which they would hesitate or even refuse to devour in a state of freedom.

Perhaps the most interesting spot in the Zoo to the general visitor is the well-known Lion-house, though children almost invariably show a predilection for the monkeys. The Lion-house was erected some few years ago, and is a great

improvement upon the former structure, now used for the bears, wolves, and hyenas; but though fairly roomy and comfortable for the larger felidae inhabiting it, yet, considering their ever increasing number, and the importance which these carnivora hold in the animal kingdom, it is unfortunate that a still larger space and more commodious building could not have been spared for the purpose. The Lion-house contains not only several fine specimens of African lions, but also almost every known species of the larger Cat tribe, the snow leopard of the Himalayas (*Felis uncia*) alone excepted.

In our changeable climate, more especially during the long dreary winter-months, when the ground is often covered with snow and hard frosts prevail, animals like the lion, the tiger, and the leopard, accustomed to tropical climates and a more equable temperature than ours, necessarily require their dens to be artificially heated, and great care taken to guard against their suffering from the extreme cold. In spite of every precaution having been taken, several valuable animals succumbed to the rigours of our late almost arctic winter. But ample space and outdoor exercise are also great desiderata, and in this respect it must be confessed that the Lion-house of our own Zoological Gardens does not compare favourably with buildings intended for a like purpose to be seen at Berlin and other continental collections. At the Thiergarten, Berlin—where may be seen a magnificent troop of seven or eight lions all in one large inclosure—there is a rocky hill—made secure, so far as the public are concerned, by a circle of high iron railings, and connected by doorways with the ordinary winter dens. So soon as summer appears and the weather becomes warm, the lions are permitted to roam about at will over this hill; and it is a pleasing sight to observe the creatures really enjoying themselves, and for a time forgetful of their present captivity. Here may be seen a shaggy veteran with his wife and cubs lying together in a group upon some slabs of rock, and basking in the rays of the mid-day sun; there, an old lioness asleep under the shade of an overhanging boulder; while her two half-grown sons, full of health and spirits, are busily engaged in a romp of hide-and-seek.

But to return. The row of elevated seats provided for visitors to the Lion-house, and facing the long line of fourteen cages, affords an excellent view of the inhabitants of the different dens. On the left we see two fine male lions in separate cages; and close to them several lionesses, one with a pair of handsome cubs. To the extreme right are three tigers—two from continental India; and a third, a young, very quick, and peculiarly dark fulvous-marked animal, recently obtained from Turkestan. It must be confessed, however, as every old Indian shikary will testify, that no one of the three before us conveys a true idea of the enormous size, strength, and muscular power which

the royal tiger attains to in a wild state. It would be no exaggeration to say, that a well-fed specimen from the Bengal Sunderbunds or Central India would reach nearly twice the weight, and measure twice the thickness round the shoulders, of any one of the three narrow-chested, hollow-flanked creatures before us. Next in importance and size comes the jaguar from America—a single specimen, but a remarkably fine, powerful animal, and, to all appearance, quite a match for any one of the three undersized tigers from the Old World. The puma or cougar of South America—a pair of beautiful grayish-red cats, but wanting in the brawny limbs and muscular neck and chest of the jaguar. Three beautiful leopards in one den. Many good naturalists would pronounce one of them to be a panther, and a distinct variety from the remaining two; but this is an undecided point among zoologists, so we will not touch upon it, merely remarking upon the extraordinary dissimilarity in the colour and marking of the skins of the three specimens before us, and which fully accounts for the difficulty so many naturalists have found in classifying these feline. Lastly, we notice the cheetah, or Indian hunting leopard, said to be the 'pard' of the ancients, common to various countries in Asia, and also throughout Africa, but not found in Ceylon, where the common leopard has erroneously gained the title of cheetah. This interesting animal has been rightly placed as a separate subgenus from the true cats, on account of the claws being only partially retractile, with the tips always visible. It is a high-standing, slender creature, thin across the loins like a greyhound, and carrying the tail more after the manner of the dog than the true cat.

As being the largest of the group before us, the lion and the tiger naturally attract our chief attention. These champions of the Old World have many a time in the days of ancient Rome been pitted the one against the other in mortal combat; but there is still a difference of opinion which of the two is the more formidable animal. Probably the tiger, on account of his more muscular hind-quarters, would have most friends; but many experienced travellers and sportsmen who have witnessed the extraordinary strength and ferocity of the lion, hold the contrary opinion. In parts of Central India, as also in Kutch and Guzerat in the Bombay Presidency, the Asiatic lion and tiger are still found in the same jungles; but we never hear of the two animals quarrelling and coming to blows. Formerly, the lion of India, on account of the male having a shorter mane, was considered to be of a different species from his African brother; but more recently, our scientific naturalists have rightly come to the conclusion that the two are identical. It must be allowed, however, that the Asiatic lion is altogether a less courageous and dangerous beast than the animal inhabiting the African continent; and our experienced Indian hunters assert that the former, even when fired at, wounded, and driven to bay, seldom turns on his pursuers and fights to the death after the manner of the royal tiger.

It is somewhat extraordinary that neither lion nor tiger has the power of climbing trees. They can make prodigious springs and bounds,

but cannot clamber up a tree 'hand over hand,' so to speak, like the bear; and this is the more surprising when we remember that the jaguar, the puma, and the leopard, like all the smaller cats, are active, expert climbers. True, both lion and tiger are far larger and heavier than any other of the feline; and undoubtedly their great strength lies in the massive proportions of the shoulder and forepart of the body, as compared with the hind-quarters; yet, when we consider the general symmetry and graceful movements of these two gigantic wild cats, we cannot help feeling disappointed that they are wanting in one of the chief characteristics of the tribe.

Most of us probably who are in the habit of constantly visiting the Zoological Gardens have heard the roar of the lion—that grand, deep-toned, terrible voice, which seems to make the very air in close proximity to the king of beasts vibrate and quiver. We also frequently read and hear tales of the roar of the tiger; but the writer ventures to say that this impression is erroneous. The Bengal tiger, when going his nightly rounds, often makes a low yawning kind of whine or sigh, ending with a subdued grunt sounding like distant thunder; and a highly unpleasant cry it is to the belated traveller on foot as he hurries along the jungle path. But this night-moan of a prowling tiger has no resemblance whatever to the deep, grand, resounding roar of the lion. Again, every tiger-shooter who has witnessed the scene can readily recall to mind that never-to-be-forgotten moment when a royal tiger worthy of the name—perhaps wounded and goaded to fury and desperation by his eager pursuers—at length turns to try conclusions with them, and with open jaws, ears laid back, flashing eye, and tail on end, a truly terrible object, bounds towards his enemies. At such times he makes the jungle resound with a succession of deep-drawn coughing growls, evidently delivered with the intention of striking terror into the hearts of his foes. But again we say, these murderous snarls of an enraged tiger are altogether dissimilar in character to the roar of the king of beasts.

The wild tribes of Central India have often told the writer that at certain seasons of the year they are made aware of tigers being in the neighbourhood by horrible 'caterwauling' sounds emanating from the jungle; and doubtless this is correct, for we all know the agony of mind we often labour under when a conclave of our domestic cats are holding a palaver on the garden wall.

There is an almost universal belief that the lion roars when he is hungry, and in a wild state when in search of prey; but the writer ventures to say that, like the bear's *lug* and other almost proverbial expressions of the kind, the idea is altogether erroneous. Probably certain verses in the Bible, more especially in the Psalms, such as 'The lions roaring after their prey, &c.,' and passages of a similar nature, have given rise to this impression. But, let it be asked, would so cunning an animal as the lion, when hungry and in search of his dinner, betray his approach and put every living creature within miles of the spot thoroughly on the *qui vive*, by making the forest echo again with his roaring? Assuredly not; for a more certain method of scaring his

prey he could not possibly adopt. All quadrupeds, more especially the deer tribe, well know and dread the voice of their natural enemy. Even domestic animals instinctively recognise and show fear on hearing the cry of a wild beast.

In India, the sportsman when out in camp during the hot-weather months, often finds himself far away from towns and villages, in some wild spot in the depths of the jungle. Here, the stillness of the night is constantly broken by the calls of various creatures inhabiting the neighbouring forest—the deep solemn hoot of the horned owl, the sharp call of the spotted deer, or the louder bell of the sambur. But these familiar sounds attract no notice from the domestic animals included in the camp circle. But should a panther on the opposite hill call his mate, or a prowling tiger passing along the river-bank mutter his complaining night-moan, they one and all immediately show by their demeanour that they recognise the cry of a beast of prey. The old elephant chained up beneath the tamarind tree stays for a moment swaying his great body backwards and forwards, and listens attentively. His neighbour, a gray Arah horse, with pricked-up ears, gazes uneasily in the direction the sound appeared to come from; while the dogs, just before lying panting and motionless in the moonlight, spring to their feet with bristling hack and lowered tail, and with growls of fear disappear under the tent fly.

Some few years ago, one of the dens allotted to the tigers was tenanted by a fine specimen named 'Plassey.' The writer first made the acquaintance of this animal many years ago when quartered with his regiment at Lucknow; and there is a story connected with Plassey's history, the account of which should read a good lesson, and yet another warning, to too eager sportsmen when tiger-shooting on foot. Two officers of the Irish Lancers, then stationed at Lucknow, were out shooting in the Oude jungles. Captain T— fired at and mortally wounded a tigress with two cubs. She dropped apparently dead, but with just sufficient life left in her to strike a last blow; and becoming aware of the near approach of her enemy, she suddenly recovered her legs, and in a moment sprang upon him and inflicted the most terrible injuries on the unfortunate sportsman. The tigress was speedily despatched, and the wounded man carried into the nearest station, where everything that could be done for him was done, but in vain, for after lingering several weeks, he succumbed.

Plassey and his brother-cub were taken to Lucknow and reared in the lancer mess-house, where they became great favourites. But time passed; the small harmless cubs grew into large powerful animals—and, as is usually the case, on attaining to a full size they speedily became troublesome and dangerous, so were first chained up, and later on confined in cages. Eventually, Plassey was brought home and presented to the Regent's Park Gardens, where he died somewhat suddenly in the prime of life. Many valuable and rare animals brought from foreign countries, at great expense and trouble, to our shores, though at first, to all appearance, in the best of health, yet before even reaching middle age, gradually pine away and die. Nor is this to be

wondered at when we remember how unnatural it is for them to be cooped up in cages, in place of a wild, unrestrained life, with liberty to wander where they will.

WHERE THE TRACKS LED TO.

IN FOUR CHAPTERS.—CONCLUSION.

It was indeed as Winny had said. I was as stunned by her words as though a heavy blow had actually fallen upon me, and for a few seconds could scarcely think, much less speak; but recovering a little from this confusion, I asked her for some explanation. I called it 'explanation,' when I spoke to her, but I felt her statement was true; their manner, their looks at parting, were sufficient to tell me all.

Godfrey Charleston had seen Winny going to and from business, and had contrived an introduction to her—this preliminary acquaintance was but slightly glanced at in her story—then, to show that his views were honourable, he had early proposed marriage, but had explained that he wished it kept a secret until some unpleasant matters which were troubling him were settled. This referred at first to the quarrels between his mother and himself, with Mr Thurles, and afterwards, to the affair of the forged bills, respecting which, to my surprise, he had spoken freely to Winny and given a tolerably correct account. Of the burglary he had said nothing, and until my speech, Winny knew nothing of it. She was startled at finding I was sent for by Mr Thurles; but when she learned it was not for the forgery—the messenger saying nothing about that—she was reassured. On that very evening Godfrey had told her that his difficulty was now settled, and, as naturally following upon this, he proposed now making their marriage known. They were talking on this subject when they met me.

All this Winny told—every word going to my heart—in a rapid, excited manner, which increased in force as she went on, until she finished with a wild declaration that she would go to Godfrey and warn him of the traps which were being set for him, of the danger which awaited him on the morrow. He was her husband—her honourable, guiltless, noble husband! she almost shrieked. It was her duty to warn him, and, if needful, to be with him.

I had a dreadful job to pacify her; and I was obliged to hold out hopes which I knew to be false, and to explain away all that I had said. That all I told her now would be proved false the very next day, I well knew, and perhaps it was cruel to deceive her; but what was I to do? I was nearly mad. I did not show it so much as Winny, but I believe I was as bad.

Never was man in a more painful position on this earth. It was impossible for me to draw back; I could not and would not do so; yet the consequences of going on were frightful. Ruin to my daughter—a blight on her life which could never be removed—this I should bring about; and to do it would kill me.

I never closed my eyes all night; and by the haggard looks of Winny in the morning, I was sure it had been the same with her. I tried to talk as though I was not thinking of the horrible

position we were in; but of course it was a dead failure. I said that as she did not seem very well, she had perhaps better not go to business that morning. If I had known what her answer would be, I should probably have held my tongue.

'Do you think, father,' she exclaimed, 'that I can attend to business or to any duty to-day? I shall wait your return here. Remember, it was by your advice that I did not, as I know I ought to have done, go to my husband last night and warn him. You said it would be all for the best if I did not do so. I shall wait here until you bring me the news which proves I was right in taking, and you in giving such advice.'

I went out to keep my appointment, as miserable and wretched a man as any who that day crawled through the streets of London. How I blamed myself for meddling in painful and disagreeable business which I ought to have been done with for ever, and how I vowed to keep clear of everything of the kind, if I could only get out of this scrape. I met Sam's wife; a pale, care-worn, thinly clad little woman; without a trace, I was sure, of the habitual criminal in her spare features, although I daresay she knew more of Sam's doings than the law would have looked favourably on.

'O Mr Holdrey!' she said—she knew me, it seemed, better than I knew her—'I am so glad you have come.—But, lor! how bad you look, sir!'

I did not answer her; I could not.

'He's going to make a bolt of it,' she went on; 'he means sailing for America in a day or two. He got the money from the old lady last night; and I have seen him since I have been here this morning.'

'Seen him?—seen?'—I began. I knew very well where she meant, but I was obliged to say something. Yet, it was impossible, I thought, when I recalled the previous night and many other incidents of the case, that young Harleston could be thinking of going abroad.

'Why, that precious Mr Godfrey,' she answered. 'We are only just in time. A pal—a friend, I mean, of poor Sam's knows him, and has kept an eye on him, to oblige Sam; so he learnt enough to tell me this.'

'Where did you see him?' Goodness knows why I asked it, but it did as well as anything else I could think of.

'He went into a house in that street,' said Mrs Sam, pointing down a turning at the corner of which we stood. We had met in Gracchurch Street, as being half-way, she living over the water, and because I thought it just possible I might have to see Mr Thurles, after hearing what she had to say.

It was a shipping office, it appeared, into which he had gone. This might easily have been on business for Thurles & Company; yet it agreed so far with what the woman had said, although the place was not an American agency. I dreaded my visit to the Mansion House. I felt that anything would be welcome which might, even for a short time, postpone the awful business I had before me, so I proposed that we should watch until he came out, stationing ourselves in a court where we were not likely to be seen.

She readily agreed, and indeed had said much

which I cannot stay to put down, which showed the bitter animosity against the young man, whom she had seen several times, and who had evidently offended her. This, although of no great consequence, was to me a little strange, as, although I had only seen Godfrey Harleston twice, yet I should have said he was the last man in the world to deserve such hatred. Whatever his faults may have been, there was something open and pleasant in his manner at any rate. However, Mrs Sam was very decided in her opinion, and while we waited at our post, gave utterance to a good many unflattering speeches regarding Mr Godfrey.

I had in my time been on the watch for six or eight hours at a stretch, and had never felt so uneasy as I did in the twenty minutes I passed in that entry in — Street. My eyes now fairly ached with watching the never-ceasing streams of figures which came and went in the busy thoroughfare. More than one person came out of the house we were interested in, but I took no more notice of them than of the other strangers. I was looking only for one figure—a figure which I dreaded to see appear, as then I could make no further excuse for delay. Intently as I was watching the office, I thought I must for an instant have dozed, or lost consciousness in some way, for, suddenly, Mrs Sam pulled me sharply by the sleeve, and said: 'There he is! He has just come out.—Don't you see him?' she added hurriedly, seeing me look confusedly from side to side. 'You say you know him. Don't you see him?—There—there!' She pointed with her finger, as she almost angrily uttered these words.

'No; I do not!' I exclaimed, with equal sharpness. 'Mr Harleston is not in sight, I am certain.'

'Why, what do you mean?' she cried, and again pointed across the road. 'Don't you see him just passing the public-house? He carries a small black bag.'

'Aha! that—that man!' I exclaimed. 'Is that Mr Godfrey Harleston?'

'Of course it is,' she retorted. 'I know him as well as I do you.'

Then she started back in alarm, and no wonder, for I burst out laughing, and ended by wringing the little woman's hand with a force which brought tears to her eyes.

'It's all right!' I exclaimed. 'If that is your Godfrey Harleston, I can understand everything. —Hi!—this was to a passing cab—Mansion House, my good fellow!—Now, jump in, Mrs Sam, and we will settle the business in no time.'

We rattled away. What a load was off my mind! How deep and cunning the trick, and yet how easy to understand, when once the clue was supplied! The man she identified as Godfrey Harleston was no other than Mr George Picknell, my friendly clerk, who had taken so much interest in me, and who had so constantly, although without any seeming intention, directed suspicion to the step-son of Mr Thurles; and if Sam had not been 'shopped,' or if Picknell had had the honesty to behave fairly to Sam's wife, his scheme might have been successful—so far as he was concerned.

We told our story at the Mansion House; and the case being one of importance, Mr. Picknell was arrested that very afternoon, as he sat at his desk in the office. If he had not been taken then, we should not have had him at all, for he had a ticket in his pocket for his passage to the Cape, by a vessel sailing the next day.

But before all these things had been done and found out, you may be sure I had hurried off home in a cab. I dashed up the steps, opened the door with my key, and then into the parlour, where Winny was sitting, half-distracted with suspense and anxiety. But there must have been something in my face which told a tale, for before I had spoken a word, she rose, and with a laugh, which was a sob before it was finished, threw her arms round my neck and exclaimed: 'My dear father! Thank heaven!' She could say no more just then for sobbing and tears; but she knew somehow that all was well. We should have made a pretty picture, if any one could have seen us, for I was as bad as Winny; but we were both hrimming over with happiness.

Yet there was a great deal to be accounted for, which at another time would have checked anything like pleasure; but I had got over the worst; the most fatal difficulty had been mastered, and I did not care about anything else.

Mr. Godfrey—the real Godfrey—called upon me that afternoon, and much was explained then; while the examination in Picknell's case supplied most of the rest. What was still obscure was cleared by Godfrey's mother and by the confession of the unlucky young fellow who had forged the bills and was apprehended about this time. The poor creature was at death's door, and never lived to take his trial.

I daresay, however, that every one can see pretty nearly what had happened, so I will be very brief. Godfrey Harleston had really taken a fancy for betting on horse-races. Picknell had told the truth in saying this. Most of what he said was true, but so mixed up and coloured that it was worse than a lie. This, of course, is common enough; all mischief-makers resort to this trick.

Well, young Godfrey had bad luck from the first; and Smithers—I forget whether I mentioned his name before, but this was the party who absconded—being his chief adviser, Harleston applied to him to obtain the money to meet some heavy losses. Smithers was as bad off as himself, and had no one to look to for help; while Godfrey, if he chose to make any emergency known, could always get assistance. He trusted to his luck to bring him round, however, without applying to his mother—most novices would have felt the same—so was ready to agree, when Smithers suggested bills at two months, which he could get discounted on his own signature—so Godfrey understood.

Harleston drew up the bills; and Smithers, being unable to get a shilling on his own name, put in a fictitious firm, depending on Godfrey getting the money to meet the bills in time. But, by an awful stroke of luck, the bills were rediscounted, and afterwards paid to Thurler & Company, where some accidental circumstance caused the recognition of Godfrey's writing, and

then inquiry soon proved that the accepting firm was a sham.

Old Thurler was delighted at this, and spoke too freely as to what he would do. Picknell was either in the room at the time when the merchant uttered his threats, or—as I should say was more likely—he listened and skulked till he found out enough to give him his cue. He saw at once how, if the young man had committed forgery, the documents proving his guilt would be a valuable property, and he determined to get them into his possession. But it was not easy to do this and keep suspicion from himself. If stolen from the safe in any ordinary manner and during the day, a clerk must have been suspected. Some little time before, Mr. Godfrey had a more serious quarrel than usual with his step-father, and had left the office. It was not until after this that he knew forgery had been committed, but he was aware that the bills had come into the possession of Thurler & Company. His absence suggested a brilliant idea to Picknell, who had a rather large circle of acquaintance of the shadiest character, and was himself, indeed, under a very demure aspect, about as bad a fellow as the Newgate calendar could show. He found out Sam, who was quite willing to undertake so profitable and easy a piece of work as Picknell represented the breaking into the office to be.

The clerk had secured impressions in wax of the keys of the outer safe—he could not get at those which opened the interior one—and Sam had no difficulty in finding an artisan who would make duplicate keys from those patterns. While dealing with his 'professional' friend, a splendid piece of strategy suggested itself to the clerk. He saw how to screen himself and throw suspicion on the quarter where it was already only too likely to fall, so he assumed the name of Godfrey Harleston. A tolerably correct account of what had occurred as regarded the forgery, fully satisfied Sam of the expediency of his new friend's proceedings, and convinced him that he 'had got hold of a good thing.'

The burglary came off successfully, but with much less immediate profit than Sam had hoped for; however, he anticipated a harvest from the bills. Of course Picknell had to tell his confederate most of his plan in regard to these documents, because they were in the burglar's possession, and he was not likely to give them up without some inducement.

Without loss of time—for he knew how dangerous a path he was treading—the clerk waited on Mrs. Thurler, and claiming to represent those who had discounted bills forged by her son—the lady knew nothing of the burglary—so wrought upon her fears, that she paid him a handsome sum on account, and promised a great deal more when the bills should be given to her. Had the poor lady had the courage to speak openly to her son, she would have found how little he had to do with the forgery. He was uneasy about it, and had been trying to raise money elsewhere to pay the firm who had originally discounted the bills. This he had succeeded in doing, which led him to tell Winny he had at last got over the difficulty he had spoken of. The young dog had more to think about than even the bills at the time, for he had just been

married to my Winny; at anyrate, his mother could see he was in trouble, and naturally feared the worst.

So the way was clear for Picknell; but he was so covetous and so thoroughly dishonourable, that he could not act fairly to anybody. He gave Sam the paltry two pounds, which aggravated the burglar more than if he had received nothing. This first sum from Mrs Thurles was obtained on the night when I tracked Picknell to the public-house in the mews, so you may guess how my appearance startled Sam. Picknell had meant to abscond the moment he got the money, and till then, he thought he could put Sam off with excuses, especially as the latter supposed he was dealing with Godfrey Harleston, and the name of Picknell had never been mentioned.

Sam found out that his accomplice was cheating him; then, being arrested, and fearing that his wife and child would be left destitute, he sent for me. Mrs Thurles got nearly all her money back; while Sam and Picknell were each tried at the same sessions of the Central Criminal Court, and were each sentenced to penal servitude; Sam's time being much the longer.

Mr Thurles paid the reward, and I shared it with Mrs Sam, who went away, soon after, to some relatives in the north of England. I never heard any more of her. But before she went, she brought me a queer, old-fashioned silver jug, as a present to Winny—at the wish of Sam, she said. I did not want to take this; but the little woman declared, most earnestly, that it was her grandmother's or great-grandmother's, and honestly come by. She said, too, that Sam had talked so much about his gratitude to me for speaking up for him at the trial, that he would be disappointed if his gift was refused. I recollected Sam's promise then, and accepted the present, which Winny has on her sideboard; and a gentleman who knows about such things has told her that the jug is very curious and valuable.

Poor Mrs Thurles was so delighted to find her son free, that she would have welcomed his wife if she had been an Eskimo. She took kindly to Winny; and I am proud to say that there is not a happier wife in London than my daughter.

AN OLD LAMMAS REVEL.

THE festival of the *Gule* of August, on Lammas Day, was one of the four great pagan festivals of Britain. This *Guyal* (or festival) probably originated in the desire to celebrate the ingathering of the first-fruits of the earth, particularly that of the grain. Upon the introduction of Christianity into this country the festival continued to be observed on that account. The usual offering at church at this season of the year was a loaf (*blaf*) of bread, hence the day became known as 'Hlaf-mass,' which became shortened into 'Lammas.'

Several customs have been observed in various portions of the United Kingdom at Lammas. A very curious custom was practised in Scotland until about the middle of last century. This appears to be a relic of the ancient pagan festival of the *Gule* of August, and was practised in some parts of the Lothians. We are informed that near the beginning of summer

the herdsmen within a certain district associated themselves into bands, which in some instances numbered one hundred members, and occasionally more. It was agreed by each of these communities to build a tower (generally of soda) in some conspicuous place near the centre of their respective districts, to serve as their place of rendezvous on Lammas Day. The base of the erection was usually about four feet square. The tower, seven or eight feet high, was made to slope up to a point, above which floated the colours of the party who had erected it. From the commencement of its being built, the tower became an object of care to the whole community, for it was deemed a disgrace to suffer it to be defaced. Any attempt made to demolish it, either by fraud or force, was resolutely resisted. Each party endeavoured to circumvent the other, and laid plans to steal out unperceived in the night-time and to level the tower to the ground. A successful exploit brought great honour to the undertakers of the expedition. Although the tower was easily rebuilt, yet the news was quickly spread through the whole district by the successful adventurers, who filled it with shouts of joy and exultation, while their unfortunate neighbours were covered with shame. To ward off this disgrace, guard was kept at night at each tower, which was made stronger and stronger as the building advanced. Numerous petty skirmishes ensued; but the assailants seldom made an attack in force, preferring rather to succeed by surprise. As soon, therefore, as they saw they were discovered, they made off as best they could.

Dr James Ferguson—to whom we are indebted for the facts concerning the Lothian Lammas tower builders—states that in order to give the alarm on these and other occasions, every person was armed with a 'tooting-horn,' that is, a horn perforated in the small end, through which wind can be forcibly blown from the mouth so as to occasion a loud noise. As every one wished to acquire dexterity in the use of this instrument, the herdsmen practised upon it during the summer while tending their flocks or herds. Towards Lammas, they were incessantly employed answering to and vicing with each other, so that the whole country rang continually with the sounds.

Before the day of the ceremony came round, each community elected a captain; and a stand of colours was prepared for the great event. This consisted of a fine table-cloth of the largest size, decorated with ribbons. All things being ready, the band of herdsmen called forth on the morning of the first of August, attired in their best apparel, and armed with stout cudgels. Repairing to the neighbouring tower, the colours were displayed in triumph; then the assembly indulged in horn-blowing and in making merry until about nine o'clock, when they partook of breakfast as they 'sat upon the green-sward.' Scouts were despatched to every quarter to watch the approach of any hostile party.

It frequently happened that on Lammas Day the herdsmen of one district proceeded to attack those of another locality, to bring them under subjection by force. On the approach of a hostile party the horns sounded to arms; the band immediately arranged itself in the best order that could be devised—the boldest

and strongest in front, and those of inferior prowess behind. They seldom remained on the defensive, but generally rushed forward bravely to meet the enemy. The captains carried the colours and led the van. When both parties met, they mutually desired each other to lower their colours, in sign of subjection. When there appeared a great disproportion in the strength of the bands, the weakest usually submitted to this ceremony without difficulty, believing their honour was saved by the evident disproportion of the match. If the hands were nearly equal in strength, neither of them yielded; blows ensued, and sometimes bloodshed. It is said that on one occasion four herdsmen were killed and many disabled. If no opponents appeared, or if they themselves had no intention of making an attack, the bands took down their colours about mid-day from their towers, and marched, blowing their horns, to the largest village in the neighbourhood. Here they were met by the lasses and the people generally, who participated in the diversions of the day. Boundaries were marked out, and proclamation made that all who intended to compete in the foot-races should appear. Prizes were offered. The first prize, usually a honnet ornamented with ribbons, was displayed upon a pole. Sometimes half-a-dozen competitors started, and ran with as great eagerness as if the prize had been a kingdom. A pair of garters was awarded to the victor of the second race; and the winner of the third gained a knife. After the races were over, the people amused themselves in such rural sports as suited their taste, and before sunset dispersed quietly to their respective homes.

In the case where two parties met and one of them yielded to the other, they marched together for some time in two separate bodies, the subjected body behind the other, and then they parted good friends, each holding their games at their own appointed place. Next day, the ribbons and tablecloth that formed the colours were returned to their respective owners; the tower was no longer a matter of consequence, and the country returned to its usual state of tranquillity.

THE LOTTERY OF DEATH.

AN EPISODE IN GUERRILLA WARFARE.

WHILE on a trip to Europe last summer, I noticed in the smoking-room of the good steamer *Servia* a rather portly, middle-aged gentleman, with a mild expression of countenance, and certainly no trace of the soldier in his bearing; and yet he was the hero of a thrilling adventure. I was introduced to him by one of the officers of the steamer, and found him to be an insurance agent in a large way, going abroad for needed rest—Mr Balcorn by name. In the course of a conversation on personal courage, one evening, over our after-dinner cigars, my new-found friend related the following interesting adventure:

You know, in the late war between the North and South, nearly all our able-bodied men on both sides of the line were more or less soldiers of some sort. I was myself a Captain and 'Commissary of Subsistence' in the United States

Volunteers, and was attached to a cavalry brigade in the army of the Potomac. In the Fall of 1864, my brigade was located in camp for the winter about four or five miles to the south of Winchester, Virginia. As a 'commissary,' I had constantly to pass with my train of wagons from the town to camp; but so confident was I that no danger could possibly befall me on that short jaunt, actually all within our own lines, that I carried neither sword nor pistol. Well, one pleasant afternoon in the latter part of November, as I was riding with my orderly, a good soldier, by the name of Leonard, at the head of the wagon-train, wearying of the slow progress made by the mule-teams, I placed the train in charge of the commissary sergeant, and rode on ahead, followed by my orderly only. I had gone little more than half-way to camp—the road we followed became wooded by young timber and underbrush—when, as I turned a bend in the road, I saw four or five mounted men about a quarter of a mile in advance of us. Calling my orderly to my side, I asked him what he thought of them.

'I guess they are some of our boys, sir. They have our uniform on, and are too far inside of our lines to be "Johnnies"' (a term applied to the Southerners).

This was my own idea; but still, I seemed intuitively to feel that all was not right. These men evidently saw or heard us, for, turning their horses' heads toward camp, they marched slowly onward. This at once disarmed me of all doubt, for I knew camp was near, and if they were not 'all right,' they would hardly venture that way; so I resumed my canter, and soon overtook my fellow-travellers. When I approached, they fled to each side of the road, as if to let me pass, and I kept on. But no sooner was my orderly and myself past their last file of men, than in an instant we found ourselves confronted by half-a-dozen pistols and the sharp command, 'Halt!' (A sixth man had come out of the hush.)

'Now, you Yanks want to keep your mouths shut, and do as you are told, or it will be all up with you,' said the commander. 'Forward—trot—march!' and away we swept at a swinging trot, Leonard and I completely surrounded by this unwelcome bodyguard, and well covered by their pistols.

About a thousand yards we trotted on, and then swept into a narrow road, more bridle-path than road, along which we kept for a mile or so, when the command 'Halt!' was again given. Leonard and I were ordered to dismount and give up our arms. I had none; but my orderly was soon deprived of his. We were again put upon our horses and strapped to the saddles in not too gentle a manner. I ventured to ask where we were going to and who my captors were; and was told we were being taken to Mosby's camp by some of his men; and furthermore, I was ordered to keep absolute silence on pain of death. From this I inferred that we had to pass very near some portion of our own camp or pickets, and for a moment I hoped some chance might yet arise for escape. But during the march we saw no soldier, or even camp-fire, and this road seemed specially devised to allow free passage from the front to the rear of our

lines by any person who knew it. In about an hour or so we came once more upon the highway. Night had fallen, but a young moon partially illuminated the road.

The commander, a lieutenant of these free riders, reined his horse to my side, and said we had passed the Yankee lines, and I could now speak if I chose. I merely said the straps hurt me which bound me to the saddle. We halted, and Leonard and I were untied, with a caution that any attempt to escape would only end in our death. Two of the guerrillas still led our horses, and the commander gave the order to gallop. We moved rapidly, until about eight p.m. For some time we had been ascending, and then slackening our pace a little. Suddenly, before and below us, upon a plain of no great extent, I saw a camp of from five to six hundred men. 'Here we are,' said the lieutenant; and in a very short time Leonard and I found ourselves under strong guard in the headquarters of Colonel Mosby at Rectortown. Under the same guard were some score more of 'Yankee' prisoners. Supper being over, we were given a little cold 'hock'-cake and the run of a pail of water for our share.

I found that some of these my fellow-prisoners were infantry-men; and one lad of about fourteen was a drummer of infantry. The majority, however, were cavalry-men caught wandering too far from their commands. Apparently, I was the only commissioned officer; but as I wore a private's overcoat, my rank was not known to my fellow-prisoners for some time.

The sentinels at once paced their beats; some of the men were asleep, and I was sitting on a log smoking, when, by the dim light of the fire, I saw a mounted figure approach. The figure halted at the guard; and presently the sergeant in charge called out: 'Fall in—fall in, you Yankees. Hurry up. Get into line there.' Finally, all being awake and placed to suit him, he turned, and saluting the horseman, said: 'The prisoners are paraded, sir.'

'How many have you?' asked the rider.—'Twenty-two in all, sir.' And then I felt we were in the presence of that terror of the valley, Colonel John S. Mosby, the best provost-marshal Sheridan had in the Shenandoah.

As Mosby advanced nearer to the camp-fire, I was struck with the lack of daring in his face and manner; but I knew he had it, from his past career. His manner was not ferocious or tyrannical, and he quietly turned upon us his eye, which seemed to see the whole of us at a glance. He spoke as follows: 'Men, your commander has seen fit to refuse all quarter to my soldiers when captured, and hangs or shoots them on the spot. I do not approve of this kind of warfare; but I must retaliate; and as I capture two of your army to every one you get of my command, that is not difficult. Just now, the balance is against you, and five of you twenty-two prisoners must die.'

You may imagine all were wide awake at this announcement.

'It is not for me to order out any five of you to execution, so the fairest way will be for you to draw for your lives.' Turning to the sergeant, he continued: 'Get twenty-two pieces of paper prepared—five numbered from one to

five. Let the other seventeen be blank, and have each man draw a ticket; and you supervise the drawing.'

The sergeant hastened away for the paper and a lantern. Hitherto, I had said nothing to any one of my rank; but now, throwing aside my overcoat, I stepped forward, and addressing the mounted officer, asked him if he was Colonel Mosby. The reply came: 'That is my name, sir.'

I was boiling over with indignation at this bloody action of the guerrilla, and I said: 'I am an officer and a gentleman; these men are regularly enlisted soldiers of the United States army; surely you are not going to treat them as spies or dogs, because they have fallen into your hands through the fortune of war. What you propose, sir, is not justice; it is assassination.'

I shall never forget the look on Mosby's face as he turned toward me, and said: 'What justice would I get, if I fell into the hands of your soldiers? I tell you, sir, I value the life of the poorest of my comrades far more than that of twenty Yankees. But I shall only retaliate in kind—man for man, and that I will have. I was not aware, sir, that you were an officer; but surely you can ask no better treatment from me than I give your men.'

I said I wanted nothing more than he would grant to all, and stepped back into my place in the ranks.

The sergeant returned just then, and the awful 'Lottery of Death,' as I have ever since called it, began. When my turn came, I drew from the hat a piece of paper; but I could not look at it—my heart stood still, my knees trembled, my hand faltered; but suddenly, as from a horrible dream, I was awakened by the word 'Blank!—Fall back, sir.'

I was not to die by rope or bullet, but to enrage for a time. I cannot describe to you my terror, my abject fear; nor do I know how I appeared to others; but I do know I shall never suffer the fear of death again so keenly.

The drawing was completed; the five victims separated from us; when, suddenly, a boy's voice was heard piteously asking for pardon, mercy, anything but death. Colonel Mosby looked toward the little drummer-boy, for he it was, and said: 'Sergeant, is that boy one of the condemned?'

'Yes, colonel,' replied the sergeant.

'Send him back in the ranks again; he is too young to die yet.'—And, 'Captain,' turning to me, 'since you are so much afraid to die, we will give you another chance.—Sergeant, place two papers—one numbered, the other blank—in your hat, and let the captain and the man next him draw again.'

At this second drawing, although I had only one chance in two of escaping, I did not feel that abject fear that first overcame me, and I stepped forward when ordered and drew another blank piece of paper. My feeling was one of intense pity for the poor fellow who drew the fatal number, and I hardly heard Mosby say: 'Well, you are a lucky fellow, captain.'

We were removed from the condemned that night. After two or three days, with the aid of some friendly negroes and some burnt cork,

I made my escape, reaching our own lines in nine days.

Of the five condemned, two escaped, one by feigning death after being shot, and the other was rescued by a friendly negro before death ensued. These two men reached our army later on, and corroborated my strange story of the 'Lottery of Death.' I think you will agree with me that I had cause for showing fear at least once in my life.

ABOUT WEEDS.

SOMEBODY once characterised 'dirt' as matter in a wrong place. Now, a weed is a plant in the wrong place. It has a place in the economy of nature, no doubt, unprofitable or even noxious as it may appear to the farmer or gardener. It must not be forgotten, moreover, that even the humblest weed is worthy of patient examination, and is a marvel of physiological structure. Then, again, some of our hedgerow wildings vie in beauty of form and elegance of habit with the cherished garden plants. What have we more charming, for instance, than traveller's joy (*Clematis vitalba*), bryony, dogrose, or the large white bindweed? And as to some other weeds, which of our garden plants figure so largely in pictures as the foxglove, purple loosestrife (*Lithrum salicaria*), the teasel, or the dock? Nevertheless, they are weeds, and as such, are entirely out of place on the garden or farm. Robbers and usurpers are they, to be ignominiously decapitated or uprooted, and consigned to the rubbish-heap or the flames.

Nature, it must be remembered, never sleeps; she either rewards the hand of the diligent with abundant harvests, or she scatters broadcast her thorns and thistles, as a punishment for man's neglect. The seeds of many species of plants have wonderful vitality. We are not about to quote the 'mummy wheat' as an example; but well-authenticated instances are recorded of seeds that have preserved their vitality for upwards of half a century. The seeds of the charlock and others of the Cruciferous tribe are of an oily nature, and therefore capable of withstanding the effects of moisture, and will germinate after being buried for years. But the process of 'soiling' the banks of new railways affords evidence of the long-continued vitality of seeds. The surface soil which has been laid aside in heaps for the purpose, is thrown back and spread upon the banks; and among the multitude of grasses and weeds which spring up and form a dense emerald carpet, there are invariably species seldom if ever found in the immediate neighbourhood. In the case of forest fires in the Far West, almost an entire new vegetation succeeds. Occasionally, the extensive moorlands in the neighbourhood of Liphook, Hants, take fire, and burn for days. The heather is dotted over with seedlings of Scotch fir, which is indigenous in the locality. Many of these trees are consumed with the heather, and with them some inches in depth of the dried surface. Seeds from the fir-cones, dropped years ago, are partially relieved from the superincumbent pressure, germinate, and in a few years supply the places of those that are destroyed. But every summer

breeze wafts the winged seeds of the thistle, dandelion, the coltsfoot, groundsel, and many others, far and wide. Borne aloft on their tiny parachutes, they sail along until a summer shower bears them down to a moist, warm, resting-place in the field or wild.

The great weed-army which infests farms and gardens in the British Islands numbers about one hundred and thirty species, and epsnais mainly of two great classes, namely, annuals (fruitful only once) and perennials (capable of producing flowers and fruit time after time). About a dozen, however, are biennials; four of these are thistles; and the most familiar of the remainder are the foxglove and the hemlock. Some of the most troublesome farm and garden pests are perennials, and among these, the most mischievous in their rapidity of growth and tenacity of life are the greater and lesser bindweeds (*Convolvulacea*) and the couch-grass (*Triticum repens*). Unless the soil be well dug and pulverised and thoroughly sifted, the attempt to eradicate either of these will be useless; every half-inch of the white crinkled roots of the bindweed or bit of couch-grass to which roots are attached will grow. The greater bindweed, perhaps, is the most difficult to get rid of, and is especially troublesome among evergreens. The tender, semi-transparent shoots stand quite erect under evergreens until they touch the lower branches; they then make rapid growth, and quickly cover the whole head of a laurel, bay, laurustinus, or rhododendron with a thick mantle of light-green leaves, twisted stems, and snow-white trumpet-shaped flowers. Beautiful in its way, no doubt; but what of the handsome shrubs it has stifled in its fatal caresses, and what of the weeks of hard labour that must be expended in the attempt to eradicate the pest?

In Italy, however, the white, underground stems of couch-grass are carefully gathered by the peasantry, taken to market in bundles, and sold as food for cattle and horses. They contain a considerable amount of starch. A variety of couch called matt grass is extensively used in Holland for binding together the sandy dunes and flats by the sea. Coltsfoot is a very troublesome weed; a variegated form of it, with handsome, bold, cream-edged leaf, is wonderfully persistent in forcing its way to other feeding-grounds. In one case under our own observation, its roots, which are tender and brittle, found their way from a bed, beneath a four feet margin of turf and an eight feet wide gravel path. The only place where one is not likely to find the root is where it was planted! In the case of the weeds hitherto particularised, it is useless to remove the part appearing above ground; and it is also so with several of the thistles; unless cut beneath the crown or collar, the result is simply to force the plant to make a fresh effort by throwing out numerous side-shoots.

A year or two ago, we were reminded by the Prime Minister, in one of his thoughtful and suggestive speeches at Hawarden, that 'one year's seedling is seven years' weeding.' One can appreciate the repetition of the adage when reflecting on the enormous increase of the common groundsel, or the still more extraordinary multiplication of the common poppy. All the year round, even when the temperature is below the

freezing-point, the small yellow blossoms of the groundsel may be noticed, each with its bundle of winged seeds, while round the parent plant are a host of young seedlings. But such is the prodigious fertility of the common poppy, that a single plant will during its year of life produce forty thousand seeds! a rate of increase that would, it is computed, in the course of seven years cover the area of Great Britain; and furnish, we may further reckon, enough opium to lull the whole population into a last long sleep. The small seed escapes when ripe through the apertures at the base of the capsule.

Next to the poppy and groundsel we may place the charlock, chickweed, and corn marigold, all annuals, and to be easily got rid of before flowering by hoeing. Some years ago, I was told by an intelligent head-gardener in the island of Colonsay, in the west of Scotland, that seeds of the oxeye daisy arrived in some packages from London. In the course of a few years, oxeye had taken entire possession of the island. It is a perennial, and also seeds plentifully, and is therefore more difficult to destroy. Both the latter and the yellow corn marigold (*Chrysanthemum segetum*) are now affected by the æsthetic world, and are assuming importance as articles of commerce, thousands of bunches being disposed of on market-days at Covent Garden.

Americans inform us that about two hundred and twenty species of weeds have been imported into their country, mostly from the British Islands. In 1837, there were said to be only one hundred and thirty-seven. The common plantain is known among the Indians as the 'Englishman's foot,' as though following the steps of the white settlers. The common yellow toadflax was, it is said, introduced by a Mr Ranstead as a garden flower, and is now known as the Ranstead weed. In 1788 it had overrun the pastures in the inhabited parts of Pennsylvania, and was the cause of bitter complaints. Chickweed is said to have been introduced as bird-seed, and the Scotch thistle arrived in a bedtick filled with thistle-down. Feathers being cheap, the bed of down was replaced by feathers, and the former thrown by the wayside. The seed soon found a congenial home. There is a troublesome American water-weed, however (*Anacharis alsinastrum*), which has avenged our transatlantic cousins threefold by choking our ponds, rivers, and canals. Another little intruder from the Cape (*Azolla pinnata*) may be troublesome. It is a charming little aquatic, and most interesting under the microscope. Some one had thrown a handful of it on a pond we wot of, where the common duckweed (*Lemna*) flourished; but azolla quickly monopolised the whole surface and crowded out the duckweed.

With regard to weeds generally, it must always be borne in mind by the farmer and gardener that they not only deprive the growing crops of the food intended for them only, but their presence robs the young plant of the air, light, moisture, and heat essential for its healthy development. It is quite possible, however, that some of the plants we now condemn as weeds will some day be utilised as green crops and ploughed in. The entire constituents of the crop are in such case returned to the soil. It is unnecessary to allude here to another aspect of the weed question further than to remark,

that a garden owes much of its charm and neatness to its order, cleanliness, and entire absence of weeds.

TECHNICAL EDUCATION AT GORDON'S COLLEGE, ABERDEEN.

A LITTLE over two years ago (March 22, 1884), under the title of 'A Practical Science and Art School,' we gave an account of the transformation that had taken place at Gordon's College, Aberdeen, the old 'hospital' having been converted into a day and evening school, both possessing sections specially devoted to technical instruction. The first independent examination of the College (day-school) has just been made, the examiners being Professor Birrell of St Andrews, and Professor Kennedy of University College, London, who report highly on the appearance made and the work done by the pupils, and on the general condition of the College. They mention that the College has so prospered under its new constitution, that whereas the pupils in attendance previous to 1881 at no time exceeded two hundred, the number on the register for this session (1885-86) exceeds eight hundred. Of these, one hundred and twenty are foundationers, who are entitled to free education, books, and an allowance of £15, 12s. per annum for maintenance and clothing, &c.; and this is all that remains of the 'hospital' system. We excerpt the portion of the Report bearing on 'Handicraft,' as being of general interest:

'A certain number of the most promising boys in the third division are allowed to receive workshop instruction for from one and a half to two hours a week; while in the fourth and fifth divisions of the Commercial School it forms a regular subject of instruction, to which about four hours a week are allotted. Some boys have only one year of this work, some (occasionally) over two years. A year and a half seems to be about the average. The work done by individual pupils depends upon their ability and probable future employment, each having free choice so far as it is practicable. All boys occupy themselves with simple wood-work for about a year after entering. Later on, they obtain practice in fitter's work (filing, chipping, scraping, &c.), and in work at simple machine tools (simple and screw-cutting lathe and planing-machines), also in forging and green-sand moulding. Those who require it are also taught something of tinplate and plumber's work. From twenty to twenty-five lads work in the workshop at one time—there is not room for more. At present, about eighty lads in all are receiving practical instruction in four detachments. Earlier in the session (a large number of the more advanced boys having left for situations in the early spring) the total number was about one hundred and twenty-five, receiving instruction in five divisions.

'For the purposes of inspection, we requested that boys at all the different stages might be put in the workshop simultaneously, in order that both elementary and advanced work might be examined. The younger boys were making

wooden joints, half-lap, scarf, dovetail, &c.; and from this, various grades of work were represented up to the different parts of a slide-rest lathe which was in process of construction. There seemed no tendency to take the work as play; it was carried on as seriously and in the same spirit as every other part of the educational course. The results were correspondingly satisfactory. It is not intended or supposed that work of this kind will supersede the necessity of apprenticeship in practical work; but it is believed that it will send the boys to their apprenticeship much better prepared than they would otherwise be to take advantage of the opportunities they then have of learning, and much more likely to be soon useful to their employers. Carried on in the spirit in which the workshop at Gordon's College is carried on, these results are certainly achieved, and can only be spoken of in terms of thorough commendation. The work turned out by the boys was not, of course, equal to that of journeymen; but judged from its own point of view, as the work of boys having had at most very little training, it was as satisfactory in execution as in intention.

It may not be out of place to mention that Mr F. Grant Ogilvie, the Science teacher at Gordon's College, has recently been appointed Principal of the Heriot-Watt College, Edinburgh; while Mr T. A. Clark, Superintendent of the workshop at Gordon's College, has been appointed to the corresponding post at Heriot's Hospital School.

AN EXPERIMENT IN CO-OPERATIVE FARMING.

We learn from a contemporary that the experiment in co-operative farming now being made by the Duke of Portland on his Gringley estate is exciting considerable attention in the country amongst all classes. The farm referred to, consisting of about four hundred and eighty-five acres, has been let, together with all the stock, horses, and implements upon it, and with all the rights of the tenant, to an association of six agricultural labourers. It is chiefly arable, there being only thirty-six acres of grass; and the soil is a deep peat, growing good wheat, and also oats, but not barley. The terms upon which the farm is let or leased are, it is said, a fixed rent, payable half-yearly. The tenant-right has been valued by parties mutually chosen, and three per cent. is to be charged on the amount, to be paid half-yearly with the rent. The horses, stock, and implements left upon the farm have also been valued by the same valuers, and three per cent. is to be charged thereon. The tenant-right, the stock, and implements are at all times to be kept up after a style of good husbandry, and the landlord, his agent, or servants are to have every facility shown them to ascertain that the capital is being in no way deteriorated. The shooting is not let with the farm. The agreement is the one usually in force on the Duke's estate, but it has been found necessary, under its peculiar circumstances of the case, to enter into a subsidiary agreement giving power to resume possession at any time, and this document will necessarily come under the Bills of Sale Act. The amount of the valuation is said to be

£2431, 10s. The farm buildings are in good order, and sufficient for the requirements of the farm. The live-stock on the farm has been valued, as also the farming implements and general stock, including sufficient seed-corn. There are four houses on the farm; but in order to meet the requirements of the six men and their families, two of the houses have been divided, and other alterations may also be made. A deed of partnership is being drawn up amongst the men, which shall be in force for seven years. Each man is to receive a wage of four pounds a month; accounts are to be balanced yearly; and after the rent, interest, and all other charges are deducted, the remainder is to be paid over towards reducing the amount of the valuation.

"THE CONSUMPTION OF TEA.

The Australian colonies and New Zealand, according to one of the Indian journals, drink far more tea per head of population than the British Islands. The Australians come first, with 766 pounds per head; the New Zealanders next, with 723 pounds per head; while the people of Great Britain, though appearing third in the list, consume only 490 pounds each. Newfoundland and Canada come next; while in the United States the consumption is only 130 pound per head; and in Russia, which is always regarded as a great tea-drinking country, the consumption is only 0.61 pound per head. Belgium, Sweden, Austria-Hungary, and Spain consume less than the other European nations; but there is not one nation on the continent, with the exception of Holland, in which the annual consumption exceeds one pound per head. But in certain parts of the countries named, tea-drinking is much more common than in others. In certain Russian districts, especially, tea is drunk constantly and copiously, and it is this fact which has given rise to the notion that Russia is the most bibulous of all tea-drinking countries.

TO A CHERRY BLOSSOM.

O CHERRY blossom! have you loved?

I have loved.

A maiden sweet as summer skies,
With tender lights in hazel eyes,
I have loved.

O cherry blossom! you are fair.

She was fair.

Her thoughts were whiter than your face;
She wore no proud pretending grace,
All so fair.

O cherry blossom! can you weep?

I can weep.

Her frail white form is buried now,
And over it this lilies blow—
Blow, and weep.

O cherry blossom! you will die.

All things die.

The sweetest things that we receive,
Ah, these of us take soonest leave—
You will die.

HYGEIA IN THE DOG-DAYS.

HYGEIA, the Goddess of Health, receives many rebuffs. She has numbers of followers, who pretend to listen to her teachings, but who do not quite understand her. She is a very simple and sweet goddess, and it would do us all good to put ourselves under her gentle training for a few of the hot weeks of summer. She would be pleased with our patronage, although she is a reputed Pagan goddess. She is no worse for that, as long as she is practical and poetical and teaches us how to make ourselves comfortable. Oh, these reeking hot days of July! I fear we break the commandments of the goddess by feeding too largely upon them. I am ashamed to own that I have been regaling myself not wisely but too well upon some of the hottest foods within reach, merely because I liked them. I have dined, and am growing hotter and hotter, in consequence of the dishes which appetite and not reason selected.

Whilst ruminating over a pipe on the evening of one of the dog-days, the thermometer being above eighty degrees in the shade, I have wondered what the goddess Hygeia would have done, and what she would have recommended, under the circumstances, for purposes of health and comfort. She wouldn't have eaten roast duck, I know; but how would she have combated the fierce heat, by way of keeping herself cool? Would she have swallowed haggis and cockaleekie in North Britain, ham and beef in Yorkshire, and tripe and onions in London? Not a bit of it. Hygeia had too much respect for herself as a goddess to indulge in such plebeian and delusive dainties in hot weather.

I can just see her in a scornful attitude, on the top of a marble column such as Alma Tadema loves to paint—she waves her hand over the smoking viands our good cooks are sending up for our delectation. She preaches abstinence in a way that makes one feel creepy, as her words seem to come down from the cold marble. She is commanding her followers to keep cool

with milk and water, and grapes and strawberries, and to leave all the alcohol and wine and beer for other occasions. I beg Hygeia's pardon, and shall renounce heat-producers on hot days in future, although they are very good, and like everything else, unfortunately, what dyspeptics like best.

What a dinner for a broiling day!—hot roast ducks and fowls, hot vegetables, a pint of heating stout, hot fish and roast beef and soups and plumpuddings, hot omelets, and a dozen more hot things, all washed down with port wine and whisky toddy, as a nightcap, with hot tea at intervals between! What would Hygeia say? She would say: Abandon all hope of keeping cool, if you put such things into your receptacles. There is only one thing unmentioned—a hot poker—and probably your punch has been stirred up with it. Such is an average Englishman's food on the sweltering days of July and August. And yet the French say we can't cook! Only imagine the plethora-producing power of an ordinary dog-days dinner.

As I know something about Hygeia, I may state that she will always hold aloof from people who feed on hot meats and beverages such as I have described. As for herself, she has (or had) an internal Limited Liability Company, which contents itself with rice-puddings and other innocent sustenance free from fats and sugars. She is, or was, a very plain, and wholesome and abstemious feeder, seldom aspiring to anything beyond the regulation cup of tea, or a drink from the pump or pail, or now and then a seltzer, potass or soda, varied with a dash of claret or sherry or champagne. There is some use in these goddesses after all. Hygeia promises (we are getting somewhat mixed with past and present) that she will befriending any one in the dog-days who follows her rôle, lives simply, eats the fruits of the season, and gives up a portion of carbonaceous food, which adds fuel to the internal fires. She will even bring Morpheus in her train, and tuck up a fellow who obeys her, and give him happy rest and sweet dreams,

without a headache in the morning. In the night-watches, she will keep him cool as a frog or a cucumber, without the fires of Vesuvius to make him kick against unknown quantities, and wrestle with demons and dragons and other onemies of sleep.

But if, like hamble children, we would benefit by the goddess to the full, there are other things to attend to besides food and drink to make us comfortable in the dog-days. We are nearly all astray in the kind of raiment we wear, both in weight and colour and quality and substance. We draw down the divine caloric hy dark, heat-producing clothes in a way which shocks Hygeia. Why not take to nankeen and cotton, and please the dear soul, and comfort ourselves as well? She never wore funeral black in hot summers. She never had a hot chimney-pot on her head; she was never seen in ebony coloured trousers or a villainous hot mantle. She believes in white apparel, as angels ought to do—white window blinds and knickerbockers, white wide-awakes and sun-shades, white fish, white bread, white pulpy fruit, or as near that colour as possible, and white curtains and covers.

And Hygeia is right. Why should we keep such big fires and jets of launth gas in the dog-days, consuming the life-giving oxygen, and yet complain of being overheated? He would be a plucky man who dare ride through public streets with white unmentionables, coat and vest, and white umbrella, on a white horse. He would look cool, however, and feel so; and if we could prevail upon ourselves to be a little lighter and whiter on saddle, or rail or steamboat, Hygeia says we should derive great joy thereby in July and August. At all events, we might make some approach to it in our dishabille. We need not be mere blocks for tailors and milliners to hang dresses upon, obliging us to be tight and uncomfortable because Fashion wills it. We require loose, lightly fitting garments, if we would keep cool.

Moreover, now that we are hobnobbing with goddesses and know their ways and philosophies, let us inquire why we open our windows and let in the broiling summer heat; and having let it in, why we do not allow it to go out again by the chimney or the roof. Limp, flabby girls, familiar to us all through Du Maurier's pencil, spend much time in stuffing our grates with lilies and peacocks' feathers and sunflowers. They fill the chimney with sacking and make the outside very pretty; thus no air makes its exit by the chimney flue. Hygeia says the young ladies are all wrong; and she doesn't care a fig for sunflowers, if they prevent the operations of nature. Hot air should ascend, and cool air come into a house. 'Dear girls,' says Hygeia, 'let these fads alone; pull out all the stuffing, and be natural. You are hot; cool yourselves. Why do you cram chimneys with flowers? It is not a festival. Make room for the king—

for air, light, and comfort. Perish the peacock plumes; down with the gandy flowers; and away with the fernery in front of them! Out with the sooty sacking. Give air, and plenty of it, in the dog-days.'

Hygeia says we don't make ourselves comfortable by the windows. We ought to have more green and white sun-blinds. We open our morning sashes and let in the bright heat all day, to make our bedrooms unbearable at night. Nevertheless, everybody does it. Cottagers in the country open their lattices amongst honeysuckles, roses, and stocks; palaces are open amongst vines and trellises of wisteria and oranges. Never mind, says our authority. Let me teach you to close all windows as closely as if they were glued, and let them remain so till the sun begins to wester in the heavens. We might do much by way of cooling our houses, if we attended to such sensible arrangements as closing in a southerly aspect, and opening in a northern one, always opening opposite the sun, and also by having free ventilation through the attics.

Directly the sun begins to decline, let every maiden and housewife, and man and woman and child, with an eye for the picturesque, and a feeling for health and beauty, throw up the Venetian or Parisian blinds. Open your rooms to the glories of the evening; throw up, and pull down the sashes; open wide all your doors. Let cool breezes enter into corridor and cellar and garret and room; let this 'caller' air circulate through every inch of the house hour after hour, whilst you are getting your evening meal, whilst you say your prayers, whilst you think of others after the toils of the day. If it be your priceless lot to dwell apart from city life, and have outside your cottage or villa or mansion, flowers, those lovely gifts of Dame Nature, let scents of rose and thyme come in at every gap in the hedge, at every rift of the wall, at every cranny of the house—scents of rosemary and mignonette, and lavender and hergamot, and lily and elderberry. Welcome the delicate perfume on its cooling, refreshing, healthy mission. It is Hygeia's gift—a superlative boon for the dog-days.

Strawberries are waiting to be plucked in all the hot months. If we have the possibility of enjoying a holiday, what can be better than a strawberry garden and plenty of cream? whilst larks aloft, and cuckoos in the shade, are singing in the plenitude of their full hearts, and whilst nimble fingers are spreading the white tablecloth on the grass to receive the dainty fruit.

Talk of lotos-eaters—we prefer strawberry gatherers. An old divine said he believed the joys of paradise would consist of eating strawberries to the sounds of a trumpet. We rejoice to think that we can have this transcendental pastime nearer home. We have the strawberries in full force, and there is generally a brass band round the corner to supply, for a small gratuity,

the trumpet. Unluckily, doctors have decided that many of us derive no advantage from the strawberry; and alas! and alack-a-day! even claret-cup and champagne and iced cream are occasionally proscribed! When boys, we ate more ices than we could afford; in maturity, we have the pocket-money—without the digestion. A lady in Franco thought that if strawberry ices were only *sinful*, no pleasure could exceed that which is to be enjoyed in the consumption of the pleasant fruit. In the eyes of some people, eating strawberries has become almost sinful, so the French lady will be able to satisfy her conscience, perhaps, on that score. Nevertheless, the old parson that Izaak Walton speaks of was right: 'Certainly, God might have made a better berry than the strawberry, but certainly, God never did.' So let us enjoy this heaven-sent fruit in the dog-days.

Not that we are at a loss for juicy fruits as long as we have our pine-apples and melons and tomatoes, our peaches and jargonelles, grapes and nectarines, and plums and apricots, a very paradisiacal melange, born of our glorious summer; all which indicates that providence nurtured them for the dog-days that we may eat and be satisfied. We may be sure that the sugar in fruits is modified by other elements, wisely elaborated by a Beneficent chemistry.

After the dog-days comes 'St Luke's little summer,' beginning on the 18th of October and lasting for an octave. Horses and cows feel the heat, dogs whine, and cats show distress, birds sip the morning dew on the leaves for refreshment, even our trees and flowers hang their branches languidly. The Italians twit us by saying that only dogs and *l'gusmen* walk in the sun. Well, it is so little of it we get, that we may be excused if we make the best of it, although we know we may suffer for our imprudence, and go home with colds or neuralgia from too free exposure and rapid cooling. Young dancing and gamboling Sylphs and Cupids in gauze, like so many butterflies in the sunbeams, had better be aware that they may get too much of it, although not often, and we must have an administrative check upon them, so that they do not fly into the heat and scorch their wings.

We are not an eminently sunny people; our fruit has not the rich orange tints of sunnier climes, where warmth is perennial and perpetual; and then dog-days come at last, and we go out to hask like lizards amongst the sand of our shores, or to splash amongst salt water at our bathing resorts. Our hot days ought to be an enjoyment, which they would be if we prepared ourselves for them and attended to the changes of temperature. We are not to throw off all our wraps in one grand effort to be free, still less to court chills by foolishly hanging about damp places merely to get cool, and losing our animal heat quicker than we can replace it. Hygeia is the last person in the world to tolerate such errors. She requires us to use common-sense, and not to use an erroneous dietary; and if we obeyed her implicitly, our summers would leave us not so relaxed and overdone and dull and full of languor as they often do. If we will

have heating food and heavy raiment, we must the precepts of Hygeia, and we shall fail to win her smile when she draws the curtain for the season.

We must not tempt malaria by walking too late in dewy grass, when the moon is up, and all nature looks bright and beautiful, and only the nightingale sings or the willow-wren warbles amongst the osiers. We may stay out too late, by way of getting cool, until we get quite hot, and feverish with a cough that won't let us sleep; and as blackbirds and thrushes call upon us with dulcet notes about three o'clock A.M., we cannot answer the polite and musical invitation, if our throats snuffer from the evening fog.

Young folk will pardon this dog-day talk, as it perhaps may benefit them. It is very pleasant to see them enjoying themselves, wild with the shimmering sunshine. We were all young once, 'before Decay's effacing fingers had swept the lines where beauty lingers,' and before rheumatism caught us in its horrible grip. Long may they enjoy themselves—and ourselves too enjoy our rollicking fun and nonsense amongst wild-birds and flowers and hayricks, amongst the scents of new-mown hay and clover and bean fields. What a lot of joy middle-aged people have to renounce, and yet we can still appreciate our dog-days!

An old proverb says, 'Every dog has his day;' but there are only forty dog-days in the calendar according to modern almanacs. They begin on the 3d of July, and end on the 11th of August. Bailey, the dictionary-maker of 1755, says the dog-days are 'certain days in July and August, commonly from the 24th of the former to the 28th of the latter, so called from the star Canis or Dog-star, which then rises and sets with the sun, and greatly increases the heat.' This was published three years after the introduction of new style, which took the place of old style in 1752. Another authority, more recent, says: 'The canicular or dog-days denote a certain number of days preceding and ensuing the heliacal rising of the Canicula or the Dog-star in the morning. Almanac-makers usually mark the beginning of the dog-days from about the end of July, and end them about their first week in September.' Most people are accustomed to connect these days with mad dogs and hydrophobia generally, and they begin to think of M. Pastour and his experiments at such times. There is evident confusion as to the time they begin and end. One thing is plain—they indicate the hotter portion of our year: some of them are so hot that we perspire if we stand still, though an Arab would freeze. What are we to do at such times? Simply, let us sit quietly if we can, and enjoy our siesta in a rather darkened room, with a pretty girl at the piano to sing for us, whilst we have our 'hubble-bubble' and rose-water or fragrant cigar and a pleasant book, till the cool of the evening. A considerable number of the dog-days are anything but hot; they are dashed by rain, as picnic parties know to their sorrow. St Switbin, of pluvial notoriety, bids us put up our umbrellas on the 15th of July, whilst he assuages the heat, and acts the part of Aquarius for the good of the world, spoiling all the custards and junkets and cheese-cakes, and taking out the stiffening of the ladies' curls and collars in

a remarkably disagreeable manner, by a sudden downpour, that often continues for many hours together. What a ungallant, heartless, and stingy old saint he must be!

IN ALL SHADES.

CHAPTER XXXVIII.

MR DUPUY was seated quietly at dinner in his own dining-room, with Nora at the opposite end of the table, and Uncle 'Zekiel, the butler, in red plush waistcoat as usual, standing solemnly behind his chair. Mr Dupuy was in excellent spirits, in spite of the little affair of the previous night, for the engar-cano had cut very heavy, and the boiling was progressing in the most admirable manner. He sipped his glass of St Emilion (as imported) with the slow, easy air of a person at peace with himself and with all creation. The world at large seemed just that moment to suit him excellently. 'Nora, my dear,' he drawled out lazily, with the unctuous deliberateness of the full-blooded man well fed, 'this is a capital pine-apple certainly—a Ripley, I perceive; far superior in flavour, Ripleys, to the cheap common black sugar-pines: always insist upon getting Ripleys.—I think, if you please, I'll take another piece of that pine-apple.'

Nora cut him a good thick slice from the centre of the fruit—it is only in England that people commit the atrocity of cutting pine in thin layers—and laid down the knife with a stifled yawn upon the tall dessert dish. She was evidently bored—very deeply bored indeed. 'Orange Grove without Harry Noel began to seem a trifle dull; and it must be confessed that to live for months together with an old gentleman of Mr Dupuy's sluggish temperament was scarcely a lively mode of life for a pretty, volatile, laughter-loving girl of twenty, like little Nora. 'What's this, papa,' she asked languidly, just by way of keeping up the conversation, 'about the negroes here in Westmoreland being so dreadfully discontented? Somebody was telling me'—Nora prudently suppressed Marian Hawthorn's name, for fear of an explosion—'that there's a great deal of stir and ferment among the plantation hands. What are they bothering and worrying about now, I wonder?'

Mr Dupuy rolled the remainder of his glassful of claret on his discriminative palate, very reflectively, for half a minute or so, and then answered in his most leisurely fashion: 'Lies, lies—a pack of lies, the whole lot of it, Nora. I know who you heard that from, though you won't tell me so. You heard it from some of your fine coloured friends there, over at Mulberry.—Now, don't deny it, for I won't believe you. When I say a thing, you know I mean it. You heard it, I say, from some of these wretched, disaffected coloured people. And there isn't a word of truth in the whole story—not a syllable—not a shadow—not a grain—not a penumbra. Absolute falsehood, the entire lot of it, got up by these designing radical coloured people, to serve their own private purposes. I assure you, Nora, there isn't in the whole world a finer, better paid, better fed, better treated, or more happy and contented peasantry than our own comfortable West Indian negroes. For my part, I can't

conceive what on earth they've ever got to be discontented about.'

'But, papa, they do say there's a great chance of a regular rising.'

'Rising, my dear!—rising! Did you say a rising? Ho, ho! that's really too ridiculous! What, these niggers rise in revolt against the white people! Why, my dear child, they'd never dare to do it. A pack of cowardly, miserable, quaking and quivering nigger blackguards. Rise, indeed! I'd like to see them try it! O no; nothing of the sort. Somebody's been imposing on you. They're too afraid of us, my dear, ever to think of venturing upon a regular rising. Show me a nigger, I always say to anybody who talks that sort of nonsense to me, and I'll show you a coward, and a thief too, and a liar, and a vagabond.—Zekiel, you rascal, pour me out another glass of claret, sir, this minute!'

Uncle 'Zekiel poured out the claret for his red-faced master with a countenance wholly unclouded by this violent denunciation of his own race; to say the truth, the old butler was too much accustomed to similar sentiments from Mr Dupuy's lips ever to notice particularly what his master was saying. He smiled and grinned, and showed his own white teeth good-humouredly as he laid down the claret jug, exactly as though Mr Dupuy had been ascribing to the African race in general, and to himself in particular, all the virtues and excellences ever observed in the most abstractly perfect human character.

'No,' Mr Dupuy went on dogmatically, 'they won't rise: a pack of mean-spirited, cowardly, ignorant vagabonds as ever were born, the niggers, the whole lot of them. I never knew a nigger yet who had a single ounce of courage in him. You might walk over them, and trample them down in heavy riding-boots, and they wouldn't so much as dare to raise a finger against you. And besides, what have they got to rise for? Haven't they got everything they can ever expect to have? Haven't they got their freedom and their cottages? But they're always grumbling, always grumbling about something or other—a set of idle, lazy, discontented vagabonds as ever I set eyes on!'

'I thought you said just now,' Nora put in with a provoking smile, 'they were the finest, happiest, and most contented peasantry to be found anywhere.'

There was nothing more annoying to Mr Dupuy than to have one of his frequent conversational inconsistencies ruthlessly brought home to him by his own daughter—the only person in the whole world who would ever have ventured upon taking such an unwarrantable liberty. So he laid down his glass of claret with a forced smile, and by way of changing the subject, said unconcernedly: 'Bless my soul, what on earth can all that glare be over yonder? Upon my word, now I look at it, I fancy, Nora, it seems to come from the direction of the trash-houses.'

Uncle 'Zekiel, standing up behind his master's chair, and gazing outward, could see more easily over the dining-table, and out through the open doorway of the room, to the hillside beyond, where the glare came from. In a moment, he realised the full meaning of the unwonted blaze, and cried out sharply, in his shrill old tones:

'O sah, O sah! de naygurs hab risen, an' dem hurmin' of de trash-houses, dem hurmin' of de trash-houses!'

Mr Dupuy, aghast with righteous anger and astonishment, could hardly believe his own ears at this unparalleled piece of nigger impertinence coming from so old a servant as Uncle 'Zekiel. He turned round upon his trusty butler slowly and solemnly, chair and all, and with his two hands planted firmly on his capacious knees, he said in his most awful voice: 'Zekiel, I'm quite at a loss to understand what you can mean by such conduct. Didn't you hear me distinctly say to Miss Nora this very minute that tho niggers don't rise, won't rise, can't rise, and never have risen? How dare you, sir, how dare you contradict me to my very face in this disgraceful, unaccountable manner!'

But Uncle 'Zekiel, quite convinced in his own mind of the correctness of his own hasty inference, could only repeat, more and more energetically every minute: 'It de true! I tellin' you, sah; it de true! I tellin' you. Naygur hab risen, runnin' an' shoutin', kickin' fire about, an' burnin' de trash-houses!'

Mr Dupuy rose from the table, pale but incredulous. Nora jumped up, white and terrified, but with a mute look of horror-struck appeal to Uncle 'Zekiel. 'Doan't you be afraid, missy,' the old man whispered to her in a loud undertone; 'we fight all de naygur in all Trinidad before we let dem hurt a single hair ob your sweet, pretty, white, little head, dearie.'

At that moment, for the first time, a loud shout burst suddenly upon their astonished ears, a mingled tumultuous yell of 'Kill de buckra—kill de buckra!' broken by deep African guttural mummings, and the crackling noise of the wild flames among the dry cane-refuse. It was the shout that the negroes raised as Delgado called them back from the intimately fire to their proper work of bloodshed and massacre.

In her speechless terror, Nora flung herself upon her father's arms, and gazed out upon the ever reddening glare beyond with unspeakable alarm.

Next minute, the cry from without rose again louder and louder: 'Buckra country for us! Kill de buckra! Colour for colour! Kill dem—kill dem!' And then, another deep negro voice, clearer and shriller far than all of them, broke the deadly stillness that succeeded for a second, with the perfectly audible and awful words: 'Follow me! I gwine to lead you to kill de Dupuys an' all de buckra!'

'Zekiel!' Mr Dupuy said, coming to himself, and taking down his walking-stick with that calm unshaken courage in which the white West Indian has never been found lacking in the hour of danger—'Zekiel, come with me! I must go out at once and quell these rioters.'

Nora gazed at him in blank dismay. 'Papa, papa!' she cried breathlessly, 'you're not going out to them just with your stick, are you? You're not going out alone to all these wretches without even so much as a gun or a pistol!'

'My dear,' Mr Dupuy answered, coolly and collectedly, disengaging himself from her arms not without some quiet natural tenderness, 'don't be alarmed. You don't understand these people as well as I do. I'm a magistrate for the county:

they'll respect my position. The moment I come near, they'll all disperse and grow as mild as babies.'

And even as he spoke, the confused shrieks of the women surged closer and closer upon their ears: 'Kill dem—kill dem! De liquor—de liquor!'

'Ah! I told you so,' Mr Dupuy murmured, half to himself, very complacently, with a deep breath. 'Only a foolish set of tipsy negresses, waking and rum-drinking, and kicking about firebrands.'

For another second, there was a slight pause again, while one might count twenty; and then the report of a pistol rang out clear and definite upon the startled air from the direction of the flaring trash-houses. It was Delgado's pistol, shooting down the tipsy recalcitrant.

'This means business!' Mr Dupuy ejaculated, raising his voice, with a sidelong glance at poor trembling Nora.—'Come along, 'Zekiel; come along all of you. We must go out at once and quiet them or disperse them.—Dick, Thomas, Emilios, Robert, Jo, Mark Antony! every one of you! come along with me, come along with me, and see to the trash-houses before these tipsy wretches have utterly destroyed them.'

(To be continued.)

BEEES AND HONEY.

The honey-bee has been an object of great interest from the very earliest ages; the most ancient historical records make frequent reference to it. 'A little balm and a little honey' formed part of the present which Jacob sent into Egypt to Joseph in the time of the great famine. The 'busy bee' figures also in Greek as well as Hebrew history. The little creature has given a name to many females of high degree. The Hebrew name of the bee (Deborah) was given to Rebecca's nurse, as also to that magnanimous prophetess whose courage and patriotism inspired the flagging zeal and waning energies of her dispirited countrymen. The Greek name of the bee (Melissa) was given to one of the daughters of Melissus, king of Crete. It was she who, with her sister Amalthæa, is fabled to have fed Jupiter with the milk of goats. She is said, also, to have first discovered the means of collecting honey from the stores of the bees, from which some ancient writers inferred that she not only bore the name, but that she was actually changed into a bee.

Another Greek story tells of a woman of Corinth, also bearing the name of Melissa, who, having been admitted to officiate in the festivals of Ceres, the goddess of agriculture, afterwards refused to initiate others, and was torn to pieces for her disobedience, a swarm of bees being made to rise from her body.

The old Greek name for the bee seems to have fallen into disuse in this country as a name given to females, though there can be no reason why its use should not be revived, for it is at least as melodious as the Hebrew name of the same significance, still applied to many a matron and maiden—a name which is expressive of honeyed sweetness, as also of unwearied energy and untiring industry.

Those who have had personal knowledge and

experience of bee-culture will bear out the remark that bees are not particular as to the size or the position of the home in which they choose to dwell, so that it suffices for them to carry on with security their wonderful operations. In their wild state, cavities of rocks and hollow trees are alike available; and in their domestic conditions they have the preference for a straw skep over a wooden box, nor for the wooden house over the straw castle.

The bee, which, while under proper control and management, is one of man's best friends, proves, when assailed by him in any way, a terrible adversary. Allusion is made to this by Moses in his story of what befell the Israelites in their wilderness sojourn: 'The Amorites came out against you, and chased you as bees do, and destroyed you.' The strength and force of their sting is such as to enable them to pierce the skin of the horse and other large animals and kill them. Their ordinary speed when in flight, is from sixty to eighty miles an hour, and they have been known to fly past the windows of an express train when travelling at full speed in the same direction. Their manner of attack is to dash straight at the object aimed at; and commonly, when excited by the presence of some unknown spectator, and especially by the intermeddling of some undexterous or mischievous person, they will attack the face, aiming especially at the eyes. When, therefore, the thousands which inhabit a single hive are aroused by the sound of alarm, well understood by all the inmates, to repel an invader, they sally forth with a courage and determination which none can withstand, attacking their foes on every side with a fury it is impossible to resist. King David must have witnessed just such a scene, which he reproduces in his description of the fierce attacks, the determined onslaughts of his bitter and unrelenting foes: 'All nations compassed me about . . . they compassed me about like bees.'

Somewhat recently, the mishap of a porter in handling a box of bees in transit by railway created an amusing and rather alarming scene at the station. There was a general stampede of passengers and officials flying in every direction, chased by the infuriated bees. It was only when some one, skilled in the management of bees, catching the queen and placing her in the box, restored confidence and quiet, for, flocking loyally to her standard, the whole colony returned to the case, which was in due time forwarded to its destination. But even this was a small affair compared with what is related in ancient history of persons being driven from their habitations, and the inhabitants of an entire town being compelled to flee before myriads of bees. *Plinius*, who flourished about 200 A.D., gives an instance of this in one of his seventeen books on animals. Mungo Park, too, the African traveller, mentions a modern instance which took place near Dooproot: 'We had no sooner unloaded the asses than some of the people, being in search of honey, inopportunistically disturbed a large swarm of bees. They came out in immense numbers, and attacked men and beasts at the same time. Luckily, most of the asses were loose, and galloped up the valley; but the horses and people were very much stung, and obliged to scamper off in all directions.

In fact, for half an hour the bees seemed to have put an end to our journey. In the evening, when they became less troublesome and we could venture to collect our cattle, we found many of them much stung and swelled about the head. Three asses were missing; one died in the evening, and another next morning. Our guide lost his horse, and many of the people were much stung about the head and face.'

The fierceness and unrelenting cruelty of the ancient Assyrians, and the terror with which their swarming multitudes filled the inhabitants of the lands they invaded, have caused them to be likened to bees in their much-dreaded attacks on such as have aroused their anger: 'And it shall come to pass in that day that the Lord shall hiss for the fly that is in the uttermost part of the rivers of Egypt, and for the bee that is in the land of Assyria.' And they shall come, and shall rest all of them in the desolate valleys, and in the holes of the rocks, and upon all thorns, and upon all hedges.' The 'hiss' was simply a call, in allusion to the note of the queen bee, as she issues her royal mandate to her ever loyal subjects to prepare for action. It has also been supposed to allude to a custom prevailing in very ancient times in connection with bee-culture, or honey-raising in the neighbourhood of rivers. During the dry season, a number of hives would be placed on a flat-bottomed boat, in the charge of an attendant. Very early in the morning the boat would begin the day's voyage, gently gliding down the river, the bees sallying forth with the sun to collect their golden stores and deposit them in their several hives, which they commonly know by some mark. The innumerable flowers on the banks of the rivers offered them a fine harvest-field. At the approach of evening, the well-known whistle or 'hiss' of the care-taker—a decent imitation of the queen's own call—would bring them back to their hives in multitudes, when the boat would be paddled back to the farm or other place of rendezvous.

As an article of food, and as a much-valued and even royal luxury, honey has been used from the remotest ages. Nor was it much, if any, less in request as a healing medicine for both inward and outward application. And though it may have fallen somewhat into disuse in these days, when many good things are overlooked, and when the artificial too often supplants the real, it may be safely predicted that the wide and rapid spread of bee-culture will induce a return to some of the wiser uses and methods and forms of adaptation employed by our early forefathers, as well as stimulate to new applications and new developments of its wondrous powers.

When and by whom mead or methuggin was first made from honey, could not be easily determined. The two words are not unfrequently applied to the same liquor; but that is not correct, as they are dissimilar. Both, however, are made from honey, sometimes also from the refuse or washings of the comb. Queen Elizabeth had such fondness for methuggin as to prescribe carefully how it should be made and with what a variety of herbs it should be flavoured. In Wales, it long continued to be held in high esteem; and its various beneficial properties have

been quaintly set forth in a letter addressed to Cliffe the historian by the learned Welshman, Rev. James Howells (born 1594), brother of Thomas Howells, some time Bishop of Gloucester and Bristol. The uniqueness of the communication is the apology for its quotation in full:

Sir—To inaugurate a new and jovial new year unto you, I send you a morning's draught [namely, a bottle of methelin]. Neither Sir John Barleycorn nor Bacchus hath anything to do with it; but it is the pure juice of the bee, the laborious bee, and king of insects. The Druids and old British bards were wont to take a carouse hereof before they entered into their speculations; and if you do so when your fancy labours with anything, it will do you no hurt; and I know your fancy to be very good. But this drink always carries a kind of state with it, for it must be attended with a brown toast; nor will it admit of but one good draught, and that in the morning; if more, it will keep a-humming in the head, and so speak much of the house it came from, I mean the hive, as I gave a caution elsewhere; and because the bottle might make more haste, have made it go upon these (poetic) feet:

J. H. T. C. Salutem et Annum Platonium.

The juice of bees, not Bacchus, here behold,
Which British bards were wont to quaff of old;
The berries of the grape with furies swell,
But in the honeycomb the graces dwell.

This alludes to a saying which the Turks have, that there lurks a devil in every berry of the vine. So I wish you cordially as to me an auspicious and joyful new year, because you know I am, &c.

Methelin is no doubt a healthy beverage, containing an admixture of milk. Palms Romulus, when he was a hundred years old, told Julius Cæsar that he had preserved the vigour of his mind and body by taking methelin inwardly, and using oil outwardly. Methelin and mead may be made very strong, and, of course, they both contain some amount of alcohol. In Virgil's days, methelin was used to qualify wine when harsh. He writes of:

Hugo heavy honeycombs, of golden juice,
Not only sweet, but pure, and fit for use;
To allay the strength and hardness of the wine,
And with old Bacchus new methelin join.

Mead or methelin was the nectar of the Scandinavian nations, which they expected to drink in heaven, using the skulls of their enemies as goblets. Thus we read in *Penrose's Carousal of Odin*:

Fill the honeyed beverage high;
Fill the skulls, 'tis Odin's cry!
Heard ye not the powerful call,
Thundering through the vaulted hall?
Fill the meathe, and spread the board,
Vassals of the grisly lord!—
The feast begins, the skull goes round,
Laughter shouts—the shouts resound.

In England at the present time, mead, like many other old and excellent domestic compounds, has passed almost entirely out of use. In very few houses could it now be found. Here and there in a farmhouse where old customs linger, it may still be had; and it is still used for colds

and other complaints, both in the case of men and cattle.

The revival of bee-keeping and the conduct of the enterprise on scientific principles, will restore honey to its wonted place in the domestic economy; and if carefully studied and thrifly managed, the cultivation of bees and the product of honey may be made to form not only an important article of food and a considerable item of domestic revenue, but an ample source of amusement, and a means of recreation healthful alike to body and mind.

A GALLANT RESCUE.

SOME six years ago I was staying in a little village about half a mile from the sea, on the south-east coast of Cornwall. I had just recovered from a severe attack of blood-poisoning, and had not yet entirely regained my strength. My two companions were Herbert B., a medical student, and Sam W., a midshipman in the royal navy, both of whom had lived the best part of their lives at the seaside, and had been accustomed from their boyhood to boating and yachting in all sorts of weather. The former, about six feet in height, was a paragon of herculean strength. The latter, four inches less, was slightly but firmly built, and in his eyes there was a look of boldness and audacity which was unmistakable, whilst his every action gave evidence of a catlike activity.

That part of the Cornish coast on which we were staying was bare and rocky; a long line of cliffs rearing themselves straight out of the water to a height of about two hundred feet, stretched half-a-dozen miles on either side of us, affording no shelter for boats of a large size. The only thing resembling a haven was a small bay about a mile from our cottage, running a hundred and fifty yards inland, and facing south-south-east. From each side of this bay a bold reef of rocks jutted straight out to sea for about seventy yards, acting as natural breakwaters, and preventing a surf in the bay even in the roughest weather. In this bay, which was very dangerous of approach to those who did not know the landmarks, we kept a fishing-boat, about twenty feet long by six feet and a half beam; long and somewhat narrow, being lightly built, and meant for rowing as well as sailing.

I was sitting alone in the dining-room of our cottage about eleven o'clock on the morning of October 25, 1879. The wind, which had been blowing fresh for the past three days, had increased during the night to a strong gale from the south-west, and my two friends had gone out about an hour before to watch the very rough sea, and to see if there were any ships or boats in distress. I felt rather unwell, and was congratulating myself on not having gone out in such weather, when I heard a quick step outside the door, and Herbert hurst in, crying in a decided manner: 'There's a dimasted schooner drifting up channel, broadside on to the sea; there's a heavy squall of rain over Looe [the nearest port, about eight miles off], and the life-boat people can't see her; so Sam and I are going off to her in the fishing-boat; and as none of the villagers will come to steer, I've come to fetch you.'

'Fetch me!' I ejaculated, horror-struck. 'But my illness'—

'Put your illness in your pocket, and keep it there till you come back,' said my friend. 'You must come—unless you're afraid,' he added, glaring at me.

Although of a weak and nervous temperament, I am by no means a coward; so I told him I was ready to accompany him. On our way to the bay, Herbert told me that when first seen, the schooner was dismantled, but that the crew had managed to keep steerage-way on her by hoisting the jib and letting her run before the gale; the canvas being rotten, however, as is often the case on board small traders, the sail had blown right out of the bolt-ropes, and the vessel had swung round broadside on to the sea.

On reaching the cliff, a thrilling sight met my gaze. Some four miles off, a square-topsail schooner of not more than two hundred tons was being tossed about at the mercy of the waves. Her mainmast had gone by the board, and her fore-topmast had snapped off a few feet above the cap; her foreyard, however, still remained. She had a tremendous list to port—which was also her lee-side—and every sea that struck her broke clean over her, and seemed to shake her fearfully. We did not stop half a minute to observe this, but hurried to the bay where our boat was heached. Sam was preparing her for sea with all speed, but as coolly as if he were going out with a water-party on the upper reaches of the Thames.

After taking out some of the ballast to lighten her for the heavy pull—we could not sail, for wind and sea were dead against us—the boat was launched. No sooner had we got beyond the points of the two natural breakwaters, than a sea with what sailors call a 'head' on it struck us on the starboard bow, sending the boat's head flying round and filling her quarter-full of water.

'Gracious powers!' I cried, 'we'll never get out there. And if we do, we'll never get back safely with the boat full of people.'

'Pull her head round to the sea, Sam, my boy.—Mind your helm, Arthur, and don't talk,' said Herbert calmly. 'And as soon as we get beyond the rocks, you can start haling,' he added, as we again met the first wave outside the bay. But this time I was prepared, and grasping the helm firmly, kept the boat's head dead on to the sea. With one vigorous stroke of the oars, which Herbert and Sam handled in a masterly style, we dashed over, almost through, the huge billow that threatened to engulf us, and not a moment too soon, for a second after it passed under our stern, it broke with a roar like the report of a cannon.

Then began a tremendous battle against wind and sea; Herbert dragging his oar through the water with that apparent ease and grace peculiar to men endowed with enormous muscular power; whilst Sam, who was pulling how-oar, strained his sinewy arms and lithe body till, by their united efforts, the spray flew over the boat's bow as she boldly dashed over, often through, the waves. We were wet to the skin; and it was with great difficulty that I could keep the boat's head straight.

After about an hour and a half of as hard work as two men ever endured in a good canoe, during which time I was kept constantly bailing, we got close under the lee of the wrecked vessel, which had now drifted to within two miles of the shore. There were eight poor half-frozen wretches on board, one of whom was a woman, clinging to some spars which were securely lashed on the mainhold hatch. When we shouted and signalled them to throw us a rope, none of them moved. The cold and wet, and staying so long in the same position, had so stiffened them that they were unable to render us any assistance in getting on board. We then tried to approach the lee-quarter of the wreck; but just as we got under the mainchains, by which my companions meant to climb on board, a tremendous sea broke over the weather-quarter, and washing down over the lee gunwale, half filled our boat, and almost upset it.

'We're gone this time!' I exclaimed.

'Then we'll all go together,' cried Sam in a tone as if he rather enjoyed the idea than otherwise.

'Out oars and pull back again,' said Herbert calmly, without taking any notice of my frightened exclamation, for the wave had washed us some distance from the schooner.

On again approaching the wreck, we found the upper part of the fore-topmast floating about thirty feet from her side, with the fore-topmast backstay still fastened to it. After some trouble, Sam managed to cut the spar adrift and make the rope secure to our boat, the other end still being fast to the schooner. Herbert, telling me to keep the boat as clear of water as possible with the haling bucket, went forward. Taking hold of the rope, he jumped overboard, quickly drew himself hand over hand to the schooner's side, and climbed on board by the forechain. Sam soon followed him, though he was nearly washed away by a sea which broke over the schooner. Herbert, however, who was clinging to the foreshrouds, quickly grasped his wrist, and saved him.

After a short consultation, Sam went aloft with a rope, and lying out on the lee foreyard arm, passed the end of the rope through the brace-block. He then came down on deck again, and making a hawline on a bight (a knot with two large loops) with it, gave it to Herbert, who made it and the other end of the rope fast to a helaying pin. Sam then came back to the boat to help me to receive the unfortunates. Herbert proceeded with great difficulty to the main hatch, and waiting till a huge wave had washed over the schooner, took the woman in his strong arms and brought her to where he had made fast the tackle. He then signalled us to haul the boat as near to the wreck as we dared. Then he put the woman's head and shoulders through one loop, and her limbs through the other, and waiting his opportunity, swung her on to the boat, where we unslung her, so to speak, and passed the knot back to Herbert. The crew followed in the same manner. As Herbert was carrying the last of them down to swing him over to the boat, the schooner shipped a tremendous sea, which sent Herbert and his burden flying into the lee scuppers. After remaining in suspense for half a minute

without either of them appearing above the hull-works, Sam jumped at once overboard, dragged himself by the rope to the wreck, and climbed on board. Stooping, he disengaged the tightly clasped arms of the sailor from Herbert's neck; he then helped his friend, who was half insensible, to rise, and propped him against the bulwarks with his arms round the backstay. Sam was then about to stoop again to help the sailor, when he recoiled with an exclamation of horror. The poor fellow's head, as he had fallen with Herbert's huge weight on the top of him, had struck against the main-bit, and was shattered: he was stone-dead!

With great difficulty Sam managed to put his friend into the bowline and sling him over to the boat, he himself following by the rope by which we were made fast to the schooner. Herbert, who looked very pale and ill, sank back exhausted in the stern-sheets. A thin stream of blood was trickling from his temple; and he also suffered from pain in his right side.

It was late in the afternoon ere we cast off our rope and prepared for our homeward journey. We had scarcely got fifty yards from the schooner's side, when a heavy sea struck her; she shook from stem to stern, then heeled over to port till we thought she would capsize; but she righted herself again, as if struggling to keep afloat, then slowly began to sink by the bow. A second wave struck her, more on the quarter; plunging her bow into the trough of the sea, she raised her stern in the air, and, diving like some sea monster, disappeared. We afterwards learned from the captain that her cargo—loose limestone blocks of about a hundredweight each—had shifted. The list this gave to the schooner had caused the mainmast, which was already slightly sprung, to go over the side, taking the fore-topmast with it. The shifting of the cargo had also started one of the planks, which accounted for the schooner springing a leak and going down.

The wind, which had chopped round to the southward, had blown us to within half a mile of the shore. Hoisting our close-reefed lug, we steered for the small haven, which we reached in safety in a quarter of an hour, after having narrowly escaped being upset by the ugly 'topping' of a wave at the entrance between the two points of rock. We were received with shouts of joy from the villagers and some coastguardsmen, who, having perceived that the vessel was drifting in shore, had prepared the rocket apparatus in case of emergency.

Poor Herbert had to be lifted out of the boat and carried to our cottage on a stretcher. A surgeon was in immediate attendance, and we awaited with no little anxiety the result of his examination. Three ribs were found to be fractured; but the wound in his temple proved very slight. Suffice it to say that our friend was able to return to his studies in a few weeks.

Neither Sam nor myself suffered from our exposure; the former remaining all night in attendance on Herbert; I, taking a steaming glass of grog, turned in between the blankets.

The shipwrecked crew were well attended to by the landlord of the village inn, and were next

morning sent on to Plymouth. Nothing was known about the man who was killed; he had shipped on board the schooner at Falmouth, but no one knew where he came from.

A week after this event, we received a letter of thanks from the owners of the schooner, who also offered us a handsome acknowledgment for our timely assistance, which we declined with thanks.

The captain, who is now master of a much larger vessel, and whose wife it was we had saved, insists on repeating his expressions of gratitude whenever we meet; but his tone becomes very grave when we laugh and attempt to make light of the danger we encountered.

OUR HEDGEHOGS.

Who among us has not been amused and delighted by Frank Buckland's most original accounts of the various animals, wild and tame, with which, at different periods of his career, he came in contact? Reading in his *Life* the account of the hedgehog imported into the Deanery in the fond hope that it would devour the black beetles, has reminded us of some of our own experiences in connection with those animals. We were troubled with black beetles in our kitchen regions, and were informed that hedgehogs would eat them. It was long before the *Life of Frank Buckland* appeared; we had not the benefit of his experience, or we might have known that, as he says, 'they don't act. A hedgehog cannot possibly hold more than a pint of beetles at a time, and in my kitchen there are gallons of them.'

When the first hedgehog arrived and was turned loose in the kitchen, we expected great things of it; but, to our surprise, the creature would not take the trouble to catch the beetles. They might swarm on every side, 'beetles to right of him, beetles to left of him; they might run right before his eyes—he only regarded them with placid indifference. He may have performed prodigies of beetle-catching in the middle of the night when no one saw him; but so far as our observation went, the only way in which he could be induced to eat any was when they were caught for him—taken up in the fire-shovel and presented to him on that as on a dish. Certainly there was no perceptible diminution in the number of black beetles, and our regret was therefore the less when before long the hedgehog mysteriously disappeared. Perhaps the beetles ate him; perhaps he managed to slip out unobserved into the yard. At all events, no trace of him was ever discovered; not even his skeleton in the flue, as was the case with Frank Buckland's hedgehog.

After this, I don't suppose we expected much in the way of beetle-eating from his successor, known amongst us by the name of Hogatha; but she was less shy and more sociable than many hedgehogs, and amused us by her droll ways. She would of course roll herself into a prickly ball when touched, but would unsarl as I sat with her on my lap, and look about her with her bright little eyes. I think she would soon have become tame, and I should have made a pet of her, but for one unfortunate circumstance. If even the whale has his unmentionable

parasite, it will not perhaps appear surprising when I mention that fleas in great number inhabited my little friend's hristly coat. When she uncouled as she lay on my lap, they could be seen running in, and ont over her odd little head and face. Perhaps this is a favourite locality, being less bright, and presumably more comfortable for the fleas than the more prickly portions of the body. But it was too much. Not even for the sake of cultivating the acquaintance of the charming Hogatha, could I face the prospect of restless nights and irritated skin, so our friendship waned.

It must have been this hedgehog which frightened me one night. I was not learned in natural history, and didn't know that hedgehogs could run fast and mount stairs. It was late at night, and I was in bed, when I was startled by hearing strange noises in the passage outside my door. Sometimes they appeared distant, sometimes near; sometimes there came a kind of scraping at the door, which had a most uncanny sound. Is there ench a thing as being physically superstitious, the mind having little or nothing to do with it? If so, I was physically superstitious; and the tendency which was in my blood, handed down perhaps from old Breton ancestors, was developed (parents and nurses, please take heed to my words!) by ghost stories told me in my childhood. At the time of which I am writing, though quite grown up, I well remember there was one story in particular I hardly dared recall, which, if it came back to my memory in the night, would cause the old feeling of terror to overwhelm me like a flood; wherefore it was with an effort that I got up and lit the gas; then, 'taking my courage in both hands,' I opened the door—and behold! there was Hogatha tearing up and down the long passage like an express train! I couldn't consent to have her *and* her fleas, and I couldn't have her without, so I conveyed her down-stairs, and shut her in the kitchen.

Then there was the sweet little baby hedgehog, given me by a lad who found a nest in his garden. We didn't mean to be cruel, either of us, but no doubt were so, for the poor little thing was too young to be taken from its mother. I could not induce it to eat or drink, and at last I gave it to the cat, which had kittens at the time, to see if she would adopt it. She received it graciously when I put it into her basket, as though it had been her own kitten. But it was all no use; the poor little thing pined and died.

We were by this time pretty well convinced that beetle-eating on the part of hedgehogs was chiefly theoretical, with just as much relation to the realities of life as many other theories, and no more. We, desired, however, to keep our minds open to new impressions; and when told that they were useful in a garden because they would eat the snails and slugs, we believed our informant, and hailed with gratitude the arrival of two fresh hedgehogs. They were named Paul and Virginia, and were shint up in the summer-house, with the idea that when they had become well accustomed to that as their place of abode, they might not run away when allowed to go loose in the garden. But there must be some mistake about their fondness for snails and slugs. I took one to Paul (or Virginia,

I am not sure which) one day; and, after some hesitation, he slowly ate it; but presently threw it out of his mouth. It didn't seem encouraging when you remember that they were expected to help to clear the garden of such pests. However, Paul and Virginia were allowed, when supposed to be efficiently at home, to take their walks abroad, and then they also disappeared, nor have I ever seen either of the queer creatures since.

HOW PAT DELANEY PAID HIS RENT.

I WAS born in County Blank, Ireland, educated in Dublin, and chose for profession—if profession it may be called—that of a tea-planter; but times were bad, health failed me, and after ten years spent in Assam, I returned to England with the intention of remaining, should a suitable appointment be procurable. No one knows, however, till he tries how difficult it is to find suitable employment on returning after a lapse of years to one's old haunts; the true reason of it being that there is too large a proportion of the *genus homo* collected together in this corner of the globe. My parents had died during my absence, and their property had passed into the hands of an elder brother with whom I was not on good terms, so I did not revisit the old place. Hearing, however, that my uncle, Sir Toby O'Bride, who owned considerable estates in another county, was having some trouble with his tenants, I thought I would cross over and see him.

My respected relative was in the act of shutting up house and beating a hasty retreat from the country. No rents had been forthcoming for some time, so he had lately changed his agent. The new one succeeded in bringing a few of the tenants to their senses and the rents to Sir Toby's pocket, but two nights previous to my arrival the unfortunate man was shot when returning home through the park, after dining with Sir Toby. The police had some *suspects* in charge; but as it proved, they had no hand in the affair, and the guilt was never brought home to the real perpetrator.

'I don't know,' said my uncle, 'what is to be done, but at present I intend going away for a time. They will shoot at me next, if I remain. This shocking affair has quite unnerved me.' My uncle did indeed look shaken and ill.

'I have a plan,' said I, 'if I may suggest it? Let me take the agent's place, and see if I can improve matters. The people all know me more or less, and if any of them try to make holes in me, they will find me well prepared to retaliate. I mean this seriously, uncle. I am an idle man at present, and will be more than pleased if you let me have my way.'

He pooh-poohed my proposition at first, declaring it was simply suicidal to attempt such a thing; but he finally consented, and I was installed in the agent's cosy cottage at a salary of four hundred pounds per annum. The first step was to purchase ostentatiously a pair of six-chambered revolvers, and erecting a target in the garden, I peppered away at it. Whenever any one came to my office, I took occasion to show what an excellent shot I was. The office window stood high from the ground, and was

furnished with iron bars and a grating like that of a prison cell. When the tenantry came to pay their rent, they found me seated at the table with one of my faithful heauties on each side of me, and it was well known that I never left the house without them.

Whether it was owing to my knowledge of the character of the people with whom I had to deal, or whether it was their knowledge that I liked them sincerely, but knew them too well to be 'done' by them or to fear their threats, I cannot say; whichever way it was, no attempt was made on my life, and a larger proportion of the rents due passed through my hands in the course of the year than had through those of the agents for some time previously. Of course, there were some tenants who could not or would not pay their rent. Stories of bad harvests, cattle dying, pigs getting measles, and starving families at home, came eloquently from the glib tongues of the delinquents. Sometimes true, more or less, generally less, for there was very little bad land on the estate. Foremost amongst the last-named section was one named Delaney. He held a good farm, which had been tenanted for generations back by Delaneys, who had been counted good tenants in their day; but this Pat came under the influence of agitators, who perverted his ideas of honesty.

Pat Delaney was among the first to refuse to pay his rent, and the aggravating part of it was that I felt sure he had the money. He was the best judge of horses in the country-side, and attended all the fairs, doing a good deal of cattle-dealing in a quiet way, so that in spite of bad seasons, he was counted a well-to-do man among his fellows. But on rent-day not a shilling was forthcoming. The old story—failure of the potato crop, bad harvest, &c. &c. sick, a lot of months to fill, and 'Wouldn't I put in a word for him with the master? Shure, the kind ould master wouldn't be hard on a poor man. He would pay up next rent-day for sartin.'

'No, Pat,' said I. 'This is the second time you have brought me that story. You are far behindhand with your rent; and if you don't pay up now, out you must go. The land is good and the rent low. If you can't make it pay, we must find another tenant who will. It goes against my heart to turn you out, for Delaneys have been on the place for three generations now; and I am sure you *can* pay, if you like. The Delaneys were never paupers before.'

Glancing sharply at him, I saw a flicker of indecision pass over his countenance, and his hand fidgeted with the edge of his jacket; but in a moment the former expression of doggedness came over his face like a cloud; he straightened himself, and said insolently: 'Shure an' wouldn't I pay if I could? It isn't dishonest ye're thinkin' I am!'

An idea struck me. Changing my tone, I remarked indifferently: 'O no; the Delaneys were always honest. But if the money is not forthcoming, out you must go, and there's an end of the matter.'

Gathering up the books, I returned them to the safe, locked it, and taking my hat, I turned to my companion and began confidentially: 'I want to ask your opinion about something, Pat. They tell me you are a good judge of a nag;

I want you to tell me what you think of one I have in the stable just now.'

At the word 'nag,' Pat was all attention.

'She's a beauty, and, I imagine, should fetch a good deal. She belongs to a friend of mine, who is hard up, and asked me if I could sell her for him, which will be easily done; but I want your opinion of her. There are two or three offers for her already. She was bought, I know, for one hundred and twenty pounds; but that is a little time ago; and my friend would take sixty pounds for her now, or even forty pounds, down.'

Pat's eyes scintillated, and I saw his hand tremble with eagerness. By this time we had reached the stable where Black Bess, my beautiful hunter, stood. She had arrived a week before, a gift from my uncle, Sir Toby, and she looked her hundred and twenty guineas every inch, the beauty!

'Cheap at forty pounds, eh, Pat? Look at her points, man. I wish I could buy her myself.'

'She's a purty crayture, sor,' ejaculated Pat as he went over her points with keen appreciation. Looking at her teeth, patting the glossy, arched neck, and finally passing his hand down each leg, he raised his head, and said in a sheepish sort of way: 'She's worth her forty pounds, sor.'

'Yes, I know that. Now, I thought you might know of some one wanting a horse. Perhaps one of your friends might like to deal; but I must have cash down.'

'I know of one man who moight take him, sor.'

'Do you? Well, I'd be glad if you'd send him to me to-morrow; and if the mare is still here, he may have her; but he must take his chance, mind you. I have several offers, and "first come first served" is the rule for this business. Sir Thomas Clarke has an eye on her, and would probably give sixty pounds if I hung on a bit; but my friend wants the money at once. Emerson of Beggside was here this morning, and liked the looks of her; said he might look back in the afternoon and close the bargain; so your friend must take his chance.'

'Shure, sor, and ye moight jest keep her till me frind sees her to-morrow. He's sartin shure to take her, and cash down on the spot.' Pat was most persuasive, and I saw by the gleam in his eye that he was sure on my hook. He knew as well as I did that he had only to take her to the first fair and he would get seventy or eighty pounds for her, if not more.

'No, no. A bargain is a bargain. I told Emerson that it would be a case of first come first served. If Black Bess is here to-morrow, your friend can have her, and welcome; but I cannot keep her for any one.'

A heavy footstep tramped up the garden path, and we heard a loud voice asking for me.

'Why, that must be Emerson back already!—Good-day, Pat; I don't think I need ask you to trouble your friend, after all.'

'Stop, stop, sor; I'll buy the mare meself, and here's the money.' Ripping open the lining of his jacket, he thrust a roll of dirty notes into my hand.

Slowly I counted them, 'One, two, three, four, five, six, seven, eight five-pound notes. That

meke forty. Thank, Pat. Just half your rent! Now, you go home and bring me the other half. I know you have it all, and you cannot deny it.

When I wrote to Sir Toby, I had the extreme satisfaction of telling him that Delaney had paid up in full; and Black Bass carries me none the worse for having been an unconscious actor in the little drama which proved so successful.

THE MONTH:

SCIENCE AND ARTS.

WE have much pleasure in recording the establishment of the 'County Scientific Society for Middlesex.' There are many such Societies, most of them in a very flourishing condition, dotted about the kingdom, where, for a small subscription, the members can meet at lectures, concerts, and various entertainments. In addition to this, many of these institutions have attached to them educational and art classes, which students can attend for a small fee. It is certainly time that the metropolitan county should be similarly provided for, although for some years past many local institutions of the kind have sprung up round about the great city. Among the vice-presidents of the new Society we note such honoured names as Lushcock, Huxley, Flower, Abel, and Geikie. These alone should insure that success which we hope the enterprise will achieve. Application for membership and other particulars may be obtained from Mr Sydney T. Klein, Clarence Lodge, Willesden, N.W.

The newspapers constantly remind us that there are many persons in the kingdom who object to vaccination, and, as a matter of course, there are not wanting agitators who are constantly calling aloud for the repeal of the law which makes the operation compulsory. Three years ago an outcry of the same kind arose at Zurich in Switzerland, with the effect that the cantonal law of compulsory vaccination was repealed. By reference to the official returns set forth in a paper by Professor Dunant, we are able to judge of the effect of the popular vote. In the canton named, the deaths from smallpox were in the year 1881, seven; in the two following years there were no deaths from that disease; in 1884, they rose to eleven; in 1885, they were seventy-three; and in the first three months of this present year, the deaths from smallpox were no fewer than eighty-five. These terrible figures need no comment, save the remark, that they do not take into account the sightless eyes and dreadful disfigurements of those who were attacked but did not die.

More conclusive evidence as to the efficacy of Jenner's discovery may be gathered from Dr Jassen's book, recently published at Brussels. Let us quote one instance given. Last year, in twenty-one German towns having an aggregate population of four millions, where vaccination was compulsory, the death from smallpox numbered twenty-seven; while in fifteen French towns owning the same aggregate number of inhabitants, but where the law was not in force, there were no fewer than eight hundred and sixty-six deaths from smallpox in the same period.

According to a Report published by Lieutenant von Nimptsch of a journey made by him with a traveller attached to the Congo Free State, a navigable river has been discovered by them which is likely to be of great importance to the future trade of the Congo. The river Congo, as will be seen by the map, flows in a north-westerly direction, and afterwards takes a southward course to its mouth in the Atlantic Ocean. Within the large tract of country comprised in this bend of the river, has been found the new waterway. It is described by the travellers as flowing through wide plains well adapted for cultivation, with pasturage, and forests of palms, and gutta-percha trees. Plenty of ivory was obtainable, in exchange for empty boxes and tins, from the inhabitants of the many villages which lined the banks of the river. There are many affluents to this waterway, one of which was navigable for two hundred and fifty miles. Altogether, we have presented to us in the Report a network of navigable rivers extending over a length of more than three thousand miles.

An interesting note in the *Times* tells of a place in Russia, in the region of the Transbaikalia, where there exists a multitude of mineral springs. These have been held in high repute by the natives for many years, and it has long been the custom to bring patients to the springs for curative treatment. Not only human beings, but cattle, sheep, and horses suffering from cutaneous affections have, it is alleged, benefited by such treatment. The temperature of the springs varies from thirty-five to over a hundred degrees Fahrenheit; and some are ferruginous, some alkaline, and others sulphurous in composition. At present, the alleged virtues of these waters are only known locally, and there is little accommodation for strangers. But it is believed that, in the future, patients will be attracted to the place from great distances.

At Sonnblick, one of the heights of the Tyrolean Alps, the summit of which is ten thousand feet above the sea-level, an observatory is in course of construction, which will represent the highest establishment of the kind in Europe. The summit of this mountain is more easily accessible than some of the neighbouring peaks; and there is already a wire-ropeway which affords communication with some mines half-way up the mountain. It was the owner of these mines who was the first to point out the desirability of establishing an observatory here. The building will consist of a blockhouse and a massive stone turret forty feet high, which will form the observatory proper. The house is being built of timber in preference to stone, as experience teaches that the former material is more effectual in keeping out the intense cold prevalent at such an altitude. The observer will be in telephonic communication with the miner's house two thousand feet below him; and from the latter place a record of his observations will be telegraphed to the nearest city, and thence all the world over.

Another portion of the old wall of London has recently been laid bare by some excavations now in progress near Ludgate Hill, at the Broadway, Blackfriars. This portion of the ancient defence of the capital is clearly a continuation of the fragment removed a few years ago, and

is built mainly of limestone and rough mortar intermingled with tiles, bricks, and, strange to say, lumps of soft white chalk.

We have lately had the opportunity of examining a little piece of apparatus which represents the most recent advance in photographic contrivances. In outward appearance it is a book, somewhat less in size than the ordinary two-shilling railway novel. Upon opening it, it is seen to have flexible folds like the web of a duck's foot, and when open, it remains so fixed by invisible springs. It is in reality a wedge-shaped camera furnished with a lens, which is sunk into the middle of the back of the imitation book. It is also furnished with a hidden shutter, which closes and uncloses the lens aperture at the will of the owner.

The recent inclement and unseasonable weather in the south of England has been characterised by two very unusual occurrences. First, at Deal in Kent, a small whirlwind lifted some boats from the beach, displaced a heavy crane on the railway, and did other damage. A few days afterwards, a similar phenomenon occurred at Sparham, Norfolk, which presented some extraordinary features. Its course could be traced for half a mile; and its path of destruction was well marked by a patch which, commencing with a width of two yards only, finished at the end of the half mile with a width of one hundred yards. During the two minutes which the storm lasted, it uprooted trees, unroofed houses, pulverised some hencoops, and wrought much destruction. The weather was perfectly calm except over the space covered by the whirlwind.

The total eclipse of the sun which will take place on the 29th of August is to be observed by an expedition sent out by the Royal Society and by funds from the Treasury. The party will at first proceed to Barbadoes, and will be conveyed thence to Grenada by a war-vessel. The island will be covered with stations for observing the eclipse, and all modern instruments will be used in the operations. The eclipse will not be visible at Greenwich.

There has been established for many years a school of practical engineering at the Crystal Palace, Sydenham, and this school has already educated many who have excelled in their profession. As an example of the practical method of instruction pursued, we note that recently a steamer of thirteen hundred tons was worked from London to Dundee and back by a division of the students who are turning their attention to marine engineering. They were divided into gangs of four, and each gang had to work for ten hours in the engine-room under the strictest discipline. While in the north, they had an opportunity of making a professional inspection of the new Tay Bridge.

Experiments have recently been made at Berlin with a new description of military shell which is charged with rolls of gun-cotton. The projectile is said to be so destructive that no defensive works however solid can withstand it. The German government are so satisfied with the experiments that they have ordered a large number of the shells to be manufactured forthwith.

According to the *Revue Scientifique*, the discovery or suggestion of the Germ theory of disease cannot

be placed to the credit of modern physicians, but is due to a Dr Goiffon, who died at Lyons more than one hundred and fifty years ago. He published a work on the Origin of the Plague in 1732, from which the following is quoted: 'Minute insects or worms can alone explain these diseases. It is true they are not visible, but it does not therefore follow that they are non-existent. It is only that our microscopes are not at present powerful enough to show them. We can easily imagine the existence of creatures which bear the same proportion to mites that mites bear to elephants. No other hypothesis can explain the facts; neither the malign influence of the stars, nor terrestrial exhalations, nor miasmas, nor atoms, whether biting or burning, acid or bitter, could regain their vitality once they had lost it. If, on the other hand, we admit the existence of minute living creatures, we understand how infection can be conveyed in a latent condition from one place, to break out afresh in another.'

Among the multifarious objects on view at that palace of wonders, the Colonial and Indian Exhibition, are naturally many products of the animal and vegetable kingdoms which are comparatively strange to British experience. Among these may be named certain drugs, gums and resins, oils, dyes, different kinds of timber fibres, leathers, &c. Now, it is evident that many of these things may be useful to our manufacturers if only their properties can be made known. With this view, arrangements have been made for the systematic examination of these foreign products, to see whether they can be applied to present manufactures, or whether they are suitable for new purposes. Visitors to the Exhibition can attend these examinations, which, if necessary, will be followed by conferences.

A thoughtful man, in strolling through the vast network of galleries at the Colonial Exhibition, cannot help feeling that there is some excuse for the national boast that 'Britannia rules the waves,' for all the treasures of the earth seem to be gathered together here. The next thought that must occur to every one is the regret that the Exhibition is only a temporary one, and that the riches which have been gathered with such care and trouble from such a wide area must soon be again dispersed. There are indications that this regret, felt as it is by the executive as well as by the casual visitor, may lead to a practical result. For years it has been urged by a few that London ought to possess a Colonial Museum. We have now an unusual opportunity for forming the nucleus of such an establishment, and that opportunity should not be lost.

It seems difficult to believe that in these hard-working and matter-of-fact times, persons should be found who revert to the gross superstitions common to the people in far-off centuries. A so-called astrologer has been for a year at least making a good living by casting nativities in the neighbourhood of Brunswick Square, London; but his operations have been cut short by a fine in the police court.

The controversy which has been going on for some months between Mr J. C. Robinson and Sir James D. Linton as to the alleged fading of water-colour paintings through exposure to light

and other influences is now to be brought to public arbitration. Sir James Linton, the President of the Royal Institute of Painters, has arranged to open an exhibition of the works of the most celebrated artists of the last fifty years, so that all may judge whether they have deteriorated. He is a champion for the permanence of this delightful phase of art; while Mr Robinson thinks differently.

The manufacture of whitelead, while representing one of our most important industries, has always had the bad character of being most destructive to the health and lives of the workmen employed in it. The substitution of other materials in the making of white paint has been constantly tried, but all give the palm to whitelead because of its 'covering' power. A new process has just been devised by Messrs Lewis and Bartlett for producing whitelead of the finest quality direct from the ore. The process is too long to describe here, but we may briefly state its advantages over the old method. It combines two manufactures, for whitelead and piglead are produced simultaneously. No deleterious fumes escape into the atmosphere, for the smelting furnace employed has no chimney. The operations are conducted with a greatly reduced expenditure of time and labour; while, best of all, the industry is not in any way hurtful to the workers. The process is an American one, and is introduced into this country by Messrs John Hall & Sons of Bristol.

It would seem from the letter of a correspondent to the *Standard* that frogs and mice are deadly enemies. This gentleman observed a battle-royal going on between these creatures in a shed. The mice pursued the frogs all over the place, for some little time without result, for the frogs managed to elude them. But gradually the mice gained an advantage, capturing and recapturing the frogs, and biting them until they were incapable of further resistance. The mice then finished the business by devouring a portion of the dead frogs.

The last new agricultural implement is a hay-loader, which has been recently patented by Mr Spilman of Dakota. This machine collects the scattered hay from the field, raises it to a suitable height, and finally discharges it upon the hayrack of the wagon. Lovers of the beauties of the country will regret that the pleasant sight afforded by a number of bronzed haymakers loading a wagon, a scene which has so often tempted the artist's pencil, should be threatened by the introduction of this mechanical thing. But time is money, and there is now little room for sentiment.

From the Report of a Cattle Show recently held at Buenos Ayres we learn that the South Americans are by no means behind Europeans in their use of machinery and implements for agricultural use. Also, that the live-stock there has much benefited by the importation of short-horns from Britain, and from Charolais in France, so far as the cattle are concerned, and that the sheep have equally benefited by acquaintance with our southdowns and with the French merinoes. Some few years ago, a loud outcry arose among our agriculturists that buyers from the other side of the Atlantic were purchasing all our best stock at prices far beyond what the

British farmer could afford to pay. There is now the hope that we shall be recouped by the importation of mutton and beef of first-rate quality. The freezing process has now been brought to such perfection that, with meat from the English stock, it should afford us the opportunity of getting the best flesh food far cheaper than we can attempt to raise it for ourselves.

Surely Mr Flinders Petrie is the most successful and energetic digger that the archaeological world has ever seen. His past discoveries have already resulted in much increased knowledge of dead nations; but now he has lighted upon a most curious find in the north-eastern delta of the Nile: this is a royal palace, which is identified with the greatest certainty with that building which the Bible calls 'Pharaoh's house in Tahpanhes.' The building carries us back in imagination to the Egypt of two thousand five hundred years ago. Next to its scriptural connection, interest centres in the description of the domestic offices of the building; and as we read of the kitchen with its dresser, the butler's pantry full of empty wine vessels and their stoppers, the sanctum of the scullery-maid with its sink, we feel that the place has been tenanted by ordinary human beings. Mr Petrie's account of the sink is worth quoting: 'It is formed of a large jar with the bottom knocked out, and filled with broken potsherds placed on edge. The water ran through this, and thence into more broken pots below, placed one in another, all bottomless, going down to the clean sand some four or five feet below.'

Mr Francis Greene publishes in an American journal the results of some careful observations which he has made on street traffic. According to him, asphalt is a far better covering for roads than either granite or wood. He puts the matter in this way: a horse will travel five hundred and eighty-three miles on asphalt before meeting with an accident, four hundred and thirteen on granite, and two hundred and seventy-two miles on wood. This agrees with experience in London with regard to the first two materials, but not with regard to wood, which experts say is the safest material of all. Londoners have certainly the best means of judging of this, for there is very little wood-paving in America. At the same time, it is quite certain that altogether accidents are far more frequent in London. This may be accounted for by the dampness of the air, which gives rise to the peculiar greasiness of the streets, so fatal to horses; and also by the increased traffic, which leads to the accumulation of manure, another element in the slippery state of the roads.

The snail harvest has recently begun in France. The 'poor man's oyster' is so appreciated by our neighbours that Paris alone consumes some forty-nine tons daily, the best kind coming from Grenoble or Burgundy. The finest specimens are carefully reared in an *escargotière*, or snail-park, such as the poor Capuchin monks planned in bygone days at Colmar and Weinbach, when they had no money to buy food, and so cultivated snails. But the majority are collected by the vine-dressers in the evening from the stone heaps where the snails have assembled to enjoy the dew. The creatures are then starved in a dark cellar for two months, and when they have closed up the aperture of their shell, are ready for

cooking. According to the true Burgundy method, they are boiled in five or six waters, extracted from the shell, dressed with fresh butter and garlic, then replaced in the shell, covered with parsley and bread crumbs, and finally simmered in white wine.

OCCASIONAL NOTES.

THE PRESENT POSITION OF THE PETROLEUM INDUSTRY.

MR CHARLES MARVIN, one of the first to direct attention to the Russian petroleum fields at Baku, in speaking lately of the transference of petroleum in bulk, said that America was at present the principal petroleum power. By the development of the petroleum fields at Baku, Russia had recently sprung into the position of the second petroleum power; and Mr Marvin thought that England should come to the front and occupy the third position as soon as possible. By the annexation of King Theebaw's dominions, we had come into possession of the Burmese petroleum fields, and he thought steps ought to be taken at once by the Indian government to survey these fields and to throw them open to British capital and enterprise. Within the last few years, since the extension of the railway, considerable petroleum deposits had been discovered in Beluchistan, but he regretted that the Indian government had decided to make them a Crown monopoly. Still more recently, petroleum in abundance had been discovered in Egypt. Since he wrote in 1882 of the Caspian petroleum fields, eighty steamers had been placed on that inland sea to carry oil in tanks from Baku to the mouth of the Volga; and on the Volga there were upwards of a hundred vessels running. At present, nearly all the petroleum arriving in Europe from Russia was brought in barrels; several tank steamers were, however, being constructed on the Tyne for the purpose of carrying petroleum in bulk.

Mr Phillips, in lecturing at the Royal Aquarium on this subject, said that the total shipments of refined oil from America in 1885 amounted to 6,985,637 barrels, of which the United Kingdom received 1,269,723; London taking 666,964 barrels. If the total shipments were placed in barrels end to end, like a string of beads, they would reach from London to New York. It is estimated that the world's consumption of illuminating oil amounts to 1,800,000 gallons every day. At the present price of oil as sold retail, and taking an ordinary circular-wick burner of forty candle power, it costs about three-sixteenths of a penny per hour, which was fifty per cent. cheaper than gas. In this connection, it may be mentioned that the Balloon Society of Great Britain is offering a prize for a cheap safety-lamp suitable for universal use. The annual production of mineral oil shale has continued to increase in Scotland, until in the present year it stands at the unprecedented figure of about two million tons.

THE CRYSTALLISATION OF FRUIT.

From a paper by Consul Mason, of Marseilles, we learn a good deal about the business of preserving fruits by the crystallising process

peculiar to South-eastern France, and practised on a large scale at Apt in the department of Vaucluse, at Clermont in Auvergne, as well as at Marseilles, Grasse, Avignon, and other places. It is curious to find these preserved fruits exported not only to England and the United States, but also to other countries, such as Algiers, the East and West Indies, and even South America, where nature has made the dwellers so far independent of preserved fruit. The fruits preserved by the crystallised process are chiefly pears, cherries, apricots, pine-apples, plums, figs, citrons, oranges, melons, and a dwarf orange called 'chinois'. Peaches are found to be too costly to be treated to any extent in this fashion.

For the purposes of crystallisation, the fruit must be fresh, clear of all decay and blemish, and of the proper degree of ripeness. The chief thing to be done in this process is to extract the juice of the fruit and replace it in the pulp with liquid sugar, which, upon hardening, not only preserves the fruit from fermentation and decay, but retains it in its original form and consistency.

The fruit is first carefully assorted in respect to size and uniform degree of ripeness. Pears, pine-apples, and quinces are pared; citrons are cut into quarters and soaked a month in seawater; and the 'pips' of apricots, cherries, and peaches are carefully removed. This work, which requires a certain degree of skill, is chiefly done by women. When thus prepared, the fruit is immersed in boiling water, which quickly penetrates the pulp, dissolving and diluting the juice, which is thereby nearly eliminated; then the fruit is taken from the water and drained, leaving only the solid portion of the pulp intact. The period of immersion must be regulated by the size and ripeness of the fruit. If immersed too long, the pulp is either over-cooked, or is left too dry and woody. If taken out too soon, the juices left in the pulp prevent perfect absorption of the sugar afterwards, and by eventually causing fermentation, destroy the value of the product. A skillful workman can tell by the colour and appearance of the pulp when it is properly 'blanched.' For the different grades of fruits, sugar-syrups of different degrees of density are required: the softer the fruit, the stronger the sirup required for its preservation. The sirup having been prepared by dissolving the sugar in pure water, the fruit is immersed in it and left at rest for a certain period in large earthenware pans, glazed inside. The sirup penetrates the pulp, and gradually withdraws and replaces the remaining fruity juice, which, as it exudes and mingles with the transparent liquid, produces a certain filmy or clouded appearance, which marks the commencement of fermentation. When this has reached a certain stage, the vessel containing the sirup and fruit is placed over the fire and heated to two hundred and twelve degrees, which corrects the fermentation. If the sirup is of proper density, the process of impregnating the fruit with sugar will be complete in about six weeks, during which period it is sometimes necessary to perform the heating process three times. The fruit now goes through one of two finishing processes according as it is to be 'glazed' or 'crystallised.' Some

manufacturers are said to quicken the crystallisation of fruit by the use of a powerful antiseptic called salicylic acid; but although time, labour, and sugar are thereby saved, Mr Mason believes it is at the expense of quality in the finished product.

THE ANCIENT BOAT AT BRIGG.

A notice will be found in No. 126 of the *Journal* referring to the discovery, at Brigg in Lincolnshire, during the excavations for a new gas-holder, of a curious and ancient boat cut out of a solid piece of oak, and measuring forty-eight feet in length, fifty-two inches in width, and thirty-three inches in depth. The vessel is in a fine state of preservation, and it is to be hoped that proper means will be provided by the authorities for preserving this interesting relic. The last news that we have of it, however, is that it has 'got into Chancery.' A curious dispute seems to have arisen as to the ownership of this relic; and probably, when the case comes to be argued before the Court, some interesting legal points will be raised by the gentlemen of the 'long robe' as to the main question at issue. Whatever may be the result, one thing is certain, that so rare a prehistoric relic as this should be preserved to the nation as public property, on the spot, or in the town near to where it was found, as an object of peculiar local interest. It would be a mistake to remove it to London, as has been suggested; but to exhibit it for money is neither fair nor proper, and the public will probably watch the proceedings before the High Court of Chancery with interest. Boats found buried in the earth and dating from remote antiquity are very rare in this country, although several have been discovered of late years in Norway and Denmark, they having been the tomb or grave of the original commander, one of the brave and lawless vikings who roamed the seas and ravaged the neighbouring coasts of Europe in search of conquest and plunder, and when at last his restless life had closed, made his beloved ship at once his monument and sepulchre.

RELICS OF ANCIENT CARTHAGE—MOSAICS.

Not long ago, some highly artistic relics of ancient Carthage were disposed of at an auction in London. Two of the finest of these are mosaics in splendid preservation, each about three feet square. The one represents a woman robed and wearing a crown of flowers, with a naked youth sitting beside her; and the other a youth carrying on his shoulders an eagle. These have been called 'Peace' and 'War,' but there seems to be no authority for this. Both works are evidently early Carthaginian, and must have belonged to a period when Carthage held a high position as a nursery of art, especially in the beautiful art of mosaic-work, of which ancient Greece has left no trace, whilst the mosaics of Rome are of a much later date. It will be remembered that Carthage was celebrated for her beautiful coloured marbles, and for the wonderful skill of her artists and workmen, which were known throughout the civilised world, for Carthage was a large city one hundred and forty years before the foundations of Rome were laid. It is possible, therefore, that the peculiar art of working in mosaic may have

been originated in Carthage, and may have found its way to Rome, where it might have been practised by Roman, or even Carthaginian artists. But, as a rule, the Roman work is very inferior to the Carthaginian. These specimens were, with many others, collected by Comte d'Hérissou from recent excavations made in a garden at Danar-el-Siat, near Tunis, and situated in the midst of the ruins of ancient Carthage. Of the authenticity of these relics there can be, therefore, no possible doubt, as they were brought direct from the site of the city itself. The two referred to, together with several other interesting specimens, were purchased by Mr Edwin Long, R.A.

Whilst on the subject of mosaics, we may mention that a valuable discovery has just been made at Chiusi in Italy. Whilst some workmen were digging out a watercourse at the foot of a hill near Monté Venere, they came upon a mosaic pavement about nine feet by six feet in size. The centre represents a double hunting scene: in the top row are three stags pursued by a hunter with a spear; below is a boar followed by two hunters, carrying each an axe and lance. The whole work is in perfect preservation, well and carefully executed with much fire and spirit, and is interesting as being the first piece of mosaic pavement that has been discovered in Chiusi or its neighbourhood.

SWEETHEART, FAREWELL.

BENEATH the whispering trees we lingered late,
Hand clasped in hand, my dearest love and I,
And he spake words I never can forget,
Of tender trust and love, until I die;
And with his eyes what lips would fail to tell
He spoke, what time he said: 'Sweetheart, farewell.'

With sweet caress he clasped me to his breast,
And looked upon me as with angel's eyes,
And kissed my brow, and kissed my lips, and kissed
The tears away that now began to rise;
And over the same tale of love would tell,
What time he sadly spoke: 'Sweetheart, farewell.'

And so he went away, and I am weary
Of nature's smiles—my heart is full of strife—
The long, long days without him are so dreary,
And all the bright has faded out of life.
'Come back, my love, the old sweet tale to tell,
But nevermore to say: "Sweetheart, farewell!"'

WILLIAM COWAN.

The Conductor of CHAMBERS'S JOURNAL begs to direct the attention of CONTRIBUTORS to the following notice:

1st. All communications should be addressed to the Editor, 339 High Street, Edinburgh.

2d. For its return in case of illegibility, postage-stamps should accompany every manuscript.

3d. To secure their safe return if illegible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, should have the writer's Name and Address written upon them IN FULL.

4th. Offerings of Verse should invariably be accompanied by a stamped and directed envelope.

If the above rules are complied with, the Editor will do his best to insure the safe return of illegible papers.

WINDS OF HEAVEN.

BY RICHARD JEFFERIES.

THE window rattled, the gate swung, a leaf rose, and the kitten chased it, 'whoo-oo' the faintest sound in the keyhole. I looked up, and saw the feathers on a sparrow's breast ruffled for an instant. It was quiet for some time: after a while it came again with heavier purpose. The folded shutters shook; the latch of the kitchen door rattled as if some one were lifting it and dropped it; indefinite noises came from up-stairs: there was a hand in the house moving everything. Another pause. The kitten was curled up on the window-ledge outside in the sunshine, just as the sleek cats curled up in the warmth at Thebes of old Egypt five or six thousand years ago, the sparrow was happy at the rose-tree; a bee was happy on a broad dandelion disc. 'Soo-hoo!'—a low whistle came through the chink; a handful of rain was flung at the window; a great shadow rushed up the valley and strode the house in an instant as you would get over a stile. I put down my book and buttoned my coat. Soo-hoo! the wind was here and the cloud—soo-hoo! drawing out longer and more plaintive in the thin mouthpiece of the chink. The cloud had no more rain in it, but it shut out the sun; and all that afternoon and all that night the low plaint of the wind continued in sorrowful hopelessness, and little sounds ran about the floors and round the rooms.

Still soo-hoo all the next day and sunlessness, turning the mind, through work and conversation, to pensive notes. At even, the edge of the cloud lifted over the forest hill westwards, and a yellow glow, the great beacon-fire of the sun, burned out, a conflagration at the verge of the world. In the night, awaking gently as one who is whispered to—listen! Ah! All the orchestra is at work—the keyhole, the chink, and the chimney; whoo-hooing in the keyhole, whistling shrill whew-w-w! in the chink, moaning long and deep in the chimney. Over in the field the

row of pines was sighing; the wind lingered and clung to the close foliage, and each needle of the million, million leaflets drew its tongue across the organ blast. A countless multitude of sighs made one continued distant undertone to the wild roar of the gables close at hand. Something seemed to be running with innumerable centipeds feet over the mouth of the chimney, for the long deep moan, as I listened, resolved itself into a quick succession of touches, just as you might play with your finger-tips tattooing on the hollow table. In the midst of the languor, the hearing settled down to the sighing of the pines, which drew the mind towards it, and soothed the senses to sleep.

Towards dawn, awake again—another change: the battering-ram at work now against the walls. Swinging back, the solid thickness of the wind came forward—crush! as the iron-shod ram's head hanging from its chains rushed to the tower. Crush! It sucked back again as if there had been a vacuum—a moment's silence and crush! Blow after blow—the floor heaved; the walls were ready to come together—alternate sucking back and heavy billowy advance. Crush! crash! Blow after blow, heave and batter and hoist, as if it would tear the house up by the roots. Forty miles that battering-ram wind had travelled without so much as a touch to check it till it struck the house on the hill. Thud! thud! as if it were iron, and not air. I looked from the windows, and the bright morning star was shining—the sky was full of the wind and the star. As light came, the thud, thud, sunk away, and nothing remained but the whoo-hoo-hoo of the keyhole and the moan of the chimney. These did not leave us; for four days and nights the whoo-hoo-hoo-whooh never ceased a moment. Whoo-hoo! whooh! and this is the wind on the hill indoors.

Out of doors, sometimes in the morning, deep in the valley, over the tree-tops of the forest, there stays a vapour, lit up within by sunlight. A glory hovers over the oaks—a cloud of light hundreds of feet thick, the air made visible by

surcharge and heaviness of eunbeams, pressed together till you can see them in themselves and not reflected. The cloud slants down the sloping wood, till in a moment it is gone, and the beams are now focused in the depth of the narrow valley. The mirror has been tilted, and the glow has shifted; in a moment more it has vanished into space, and the dream has gone from the wood. In the turns of the wind, vast bundles of mist are borne against the hill; they widen and elip, and lengthen, drawing out; the wind works quickly with moist colours ready and a wide brush laying broadly. Colour comes up in the wind; the thin mist disappears, drunk up in the grass and trees, and the air is full of blue behind the vapour. Blue sky at the far horizon—rich deep blue overhead—a dark-brown blue deep yonder in the gorge among the trees. I feel a sense of blue colour as I face the strong breeze; the vibration and blow of its force answer to that hue, the sound of the ewinging branches and the rush—rush in the grass is azure in its note; it is wind-blue, not the night-blue, or heaven-blue, a colour of air. To see the colour of the air, it needs great space like this—a vastness of concavity and hollow—an equal expanse of valley and plain under, to the dome of the sky over, for no vessel of earth and sky is too large for the air-colour to fill. Thirty, forty, and more miles of eye-sweep, and beyond that the limitless expanse over the sea—the thought of the eye knows no butt, shooting on with stellar penetration into the unknown. In a small space there seems a vacuum, and nothing between you and the hedge opposite, or even across the valley; in a great space the void is filled, and the wind touches the sight like a thing tangible. The air becomes itself a cloud, and is coloured—recognised as a thing suspended; something real exists between you and the horizon. Now, full of sun and now of shade, the air-cloud rests in the expanse.

It is summer, and the wind-birds top the furze; the bright stonechat, velvet-black and red and white, sits on the highest spray of the gorse, as if he were painted there. He is always in the wind on the hill, from the hail of April to August's dry glow. All the mile-long slope of the hill under me is purple-clad with heath down to the tree-filled gorge where the green boughs seem to join the purple. The cornfields and the pastures of the plain—count them one by one till the hedges and squares close together and cannot be separated. The surface of the earth melts away as if the eyes insensibly shut and grew dreamy in gazing, as the soft clouds melt and lose their outline at the horizon. But dwelling there, the glance slowly finds and fills out something that interposes its existence between us and the further space. Too shadowy for the substance of a cloud, too delicate for outline against the sky, fainter than haze, something of which the eye has consciousness, but cannot put into a word to itself. Something is there. It is the air-cloud adhering like a summer garment to the great downs by the sea. I cannot see the substance of the hills nor their exact curve along the sky; all I can see is the air that has thickened and taken to itself form about them. The atmosphere has collected as the shadow

collects in the distant corner of a room—it is the shadow of the summer wind. At times it is so soft, so little more than the air at hand, that I almost fancy I can look through the solid boundary. There is no cloud so faint; the great hills are but a thought at the horizon; I think them there rather than see them; if I were not thinking of them, I should scarce know there was even a haze, with so dainty a hand does the atmosphere throw its covering over the massy downs. Riding or passing quickly, perhaps you would not observe them; but stay among the heathbells and the sketch appears in the south. Up from the sea over the cornfields, through the green boughs of the forest, along the slope, comes a breath of wind, of honey-sweetened air, made more delicate by the fanning of a thousand wings.

The labour of the wind: the cymbals of the aspen clashing, from the lowest to the highest bough, each leaf twirling first forwards and then backwards and swinging to and fro, a double motion. Each lifts a little and falls back like a pendulum, twisting on itself; and as it rises and sinks, strikes its fellow-leaf. Striking the side of the dark pines, the wind changes their colour and turns them paler. The oak leaves slide one over the other, hand above hand, laying shadow upon shadow on the white road. In the vast net of the wide elm-tops, the drifting shadow of the cloud which the wind brings is caught for a moment. Pushing aside the stiff ranks of the wheat with both arms, the air reaches the sun-parched earth. It walks among the mowing-grass like a farmer feeling the crop with his hand one side, and opening it with his walking-stick the other. It rolls the wavelets carelessly as marbles to the shore; the red cattle reddens the pool and stand in their own colour. The green caterpillar ewings as he spins his thread and lengthens his cable to the tide of air, descending from the tree; before he can slip it, the whitethroat takes him. With a thrust, the wind hurls the swallow, or the still grander traverser of air, the swift, fifty miles faster on his way; it ruffles back the black velvet of the crepey mole peeping forth from his burrow. Apple-bloom and crab-apple bloom have been blown long since athwart the furrows over the orchard wall; May petals and June roses scattered; the pollen and the seeds of the meadow-grasses thrown on the threshing-floor of mother-earth in basketfuls. Thistle down and dandelion down, the brown down of the goat's-beard; by-and-by the keys of the sycamores twirling aslant—the wind carries them all on its back, gossamer wob and great heron's vane—the same weight to the wind; the drops of the waterfall blown aside sprinkle the bright green ferns. The voice of the cuckoo in his season travels drowsily on the zephyr, and the note comes to the most distant hill, and deep into the deepest wood.

The light and fire of summer are made beautiful by the air, without whose breath the glorious summer were all spoiled. Thick are the hawthorn leaves, many deep on the spray; and beneath them there is a twisted and intertangled winding in and out of boughs, such as no curious ironwork of ancient artist could equal; through the leaves and metal-work of boughs the soft west wind wanders at its ease. Wild wasp and intored

bee sing sideways on their course as the breeze fills their vanes; with broad coloured sails boomed out, drifts the butterfly alce. Beside a brown-coated stone in the shadowed stream, a brown trout watches for the puffs that slay the May-flies. Their ephemeral wings were made for a more exquisite life; they endure hut one sun; they hear not the touch of the water; they die like a dream dropping into the river. To the amethyst in the deep ditch the wind comes; no petal so hidden under green it cannot find; to the blue hill-flower up by the sky; it lifts the guilty head of the passionate poppy that has sinned in the sun for love. Sweet is the rain the wind brings to the wallflower browned in the heat, a-dry on the crumbling stone. Pleasant the sunbeams to the marigold when the wind has carried the rain away and his sun-disc glows on the bank. Acres of perfume come on the wind from the black and white of the bean-field; the fire fill the air by the copse with perfume. I know nothing to which the wind has not some happy use. Is there a grain of dust so small the wind shall not find it out? Ground in the mill-wheel of the centuries, the iron of the distant mountain floats like gossamer, and is drunk up as dew by leaf and living lung. A thousand miles of cloud go by from morn till night, passing overhead without a sound; the immense packs, a mile square, succeed to each other, side by side, laid parallel, book-shape, coming up from the horizon and widening as they approach. From morn till night the silent footfalls of the ponderous vapours travel overhead, no sound, no creaking of the wheels and rattling of the chains; it is calm at the earth, but the wind labours without an effort above, with such ease, with such power. Gray smoke hangs on the hillside where the couch-heaps are piled, a cumulus of smoke; the wind comes, and it draws its length along like the genti from the nation pot; there leaps up a great red flame shaking its head; it shines in the bright sunlight; you can see it across the valley.

A perfect summer day with a strong south wind: a cloudless blue sky blown pale, a summer sun blown cool, deep draughts of refreshing air to man and horse, clear definition of red-tile roof and conical east, perfect colour of soft ash-green trees. In the evening, fourteen black swifts rushing together through the upper atmosphere with shrill cries, sometimes aside and on the tip of one wing, with a whirl descending, a black trail, to the tiled ridge they dwell in. Fine weather after this.

A swooning August day, with a hot east wind, from which there is no escape, which gives no air to the chest—you breathe and are not satisfied with the inspiration; it does not fill; there is no life in the killed atmosphere. It is a vacuum of heat, and yet the strong hot wind bends the trees, and the tall firs wrestle with it as they did with Sinis, the Pine-bender, bowed down and rebounding, as if they would whirl their cones away like a catapult. Masses of air are moving by, and yet there is none to breathe. No escape in the shadow of hedge or wood, or in the darkened room; darkness excludes the heat that comes with light, but the heat of the oven-wind cannot be shut out. Some monstrous dragon of the Chinese sky pants his fiery breath upon

us, and the brown grass stalks threaten to catch flame in the field. The grain of wheat that was full of juice dries hard in the ears, and water is no more good for thirst. There is not a cloud in the sky; but at night there is heavy rain, and the flowers are beaten down. There is a thunder-wind that blows at intervals when great clouds are visibly gathering over the hayfield. It is almost a calm; but from time to time a breath comes, and a low mournful cry sounds in the hollow farmhouse—the windows and doors are open, and the men and women have gone out to make hasty help in the hay ere the storm—a mournful cry in the hollow house, as unhappy a note as if it were soaked February.

In April, six miles away in the valley, a vast cloud came down with swan-shot of hail, black as blackest smoke, overwhelming house and wood, all gone and mixed with the sky, and behind the mass there followed a white cloud sunlit dragging along the ground, like a cumulus fallen to the earth. At sunset, the sky cleared, and under the glowing rim of the sun, a golden wind drove the host of vapour before it, scattering it to the right and left. Large pieces caught and tore themselves in the trees of the forest, and one curved fragment curled from the ridge, fell in the narrow comb, lit up as it came down with golden sunset rays, standing out bright against the shadowed wood. Down it came slowly, as it were with outstretched arms, loth to fall, carrying the coloured light of the sky to the very surface of the earth.

IN ALL SHADES.

BY GRANT ALLEN,

AUTHOR OF 'BABYLON,' 'STRANGE STORIES,' ETC. ETC.

CHAPTER XXXIX.

HALF-WAY down to the blazing trash-houses, Mr Dupuy and his little band of black allies, all armed only with the sticks they had hastily seized from the stand in the piazza, came on a sudden face to face with the wild and frantic mob of half-tipsy rioters. 'Halt!' Mr Dupuy called out in a cool and unmoved tone of command to the reckless insurgents, as they marched on in irregular order, brandishing their cutlasses wildly in the flickering firelight. 'You blackguards, what are you doing here, and what do you mean by firing and burning my trash-houses?'

By the ruddy light of the lurid blaze behind him, Louis Delgado recognised at once the familiar face of his dearest enemy. 'Me fren's,' he shrieked, in a loud outburst of gratified vindictiveness, 'dis is him—dis is him—dis de buckra Dupuy we come to kill now! De Lard has delibbered him into our hands without so much as gib us de trouble ob go kn' attack him.'

But before even Delgado could bring down with savage joy his uplifted weapon on his hated enemy's bare head, Mr Dupuy had stepped boldly and energetically forward, and catching the wiry African by his outstretched arm, had cried aloud in his coolest and most deliberate accents: 'Louis Delgado, put down your cutlass. As a magistrate for this island, I arrest you for riot.'

His resolute boldness was not without its due effect. For just the swing of a pendulum there was a profound silence, and that great mob of strangely beraged and rum-maddened negroes held its breath irresolutely, doubting in its own six hundred vacillating souls which of the two things rather to do—whether to yield as usual to the accustomed antithrity of that one bold and solitary white man, the accredited mouthpiece of law and order, or else to rush forward madly and hack him then and there into a thousand pieces with African ferocity. So instinctive in the West Indian negro's nature is the hereditary respect for European blood, that even though they had come there for the very purpose of massacring and mutilating the defenceless buckra, they stood appalled, now the actual crisis had fairly arrived, at the bare idea of venturing to dispute the question openly with the one lions and unarmed white man.

But Louis Delgado, African born that he was, had no such lingering West Indian prejudices. Disengaging his sinewy captive arm from Mr Dupuy's flabby grasp with a sudden jerk, he lifted his cutlass once more high into the air, and held it, glittering, for the twinkling of an eye, above the old man's defenceless head. One moment, Uncle 'Zekiel saw it gleam fearfully in the red glare of the burning trash-houses; the next, it had fallen on Mr Dupuy's shoulder, and the blood was spouting out in crimson splashes over his white tie and open shirt-front, in which he had risen but a few minutes before so unsuspectingly from his own dinner-table.

The old planter reeled terribly before the violent force of that staggering blow, but kept his face still turned bravely with undiminished courage toward the exultant enemy. At the sight of the gushing blood, however—the proud buckra blood, that shows so visibly on the delicate white European skin—the negroes behind set up a loud and horrid peal of unearthly laughter, and rushed forward, all their hesitation flung away at once, closing round him in a thickly packed body, each eager not to lose his own share in the delightful excitement of hacking him to pieces. A dozen cutlasses gleamed aloft at once in the bare black arms, and a dozen more blows were aimed at the wounded man fiercely by as many hideous, grinning rioters.

Uncle 'Zekiel and the household negroes, oblivious and almost unconscious of themselves, as domestic servants of their race always are in the presence of danger for their master or his family, pressed around the reeling white man in a serried ring, and with their sticks and arms, a frail barrier, strove manfully to resist the fierce onslaught of the yelling and leaping plantation negroes. In spite of what Mr Dupuy had just been saying about the negroes being all alike cowards, the petty handful of faithful blacks, forming a close and firm semicircle in front of their wounded master, fought like wild beasts at bay with hands and arms, and legs and teeth, and elbows and knees, opposing stoutly, by fair means and foul, the ever-pressing sea of wild rioters. As they fought, they kept yielding slowly but cautiously before the steady pressure; and Mr Dupuy, reeling and staggering he knew not how, but with his face kept ever, like a fighting Dupuy, turned dauntlessly toward the

surging enemy, retreated slowly backward step by step in the direction of his own piazza. Just as he reached the bottom of the steps, Uncle 'Zekiel meanwhile shielding and protecting him manfully with his pordy person, a woman rushed forth from the mass of the rioters, and with hideous shrieks of 'Hallelujah, hallelujah!' hacked him once more with her blunt cutlass upon the ribs and body.

Mr Dupuy, faint and feeble from loss of blood, but still cool and collected as ever, groped his way ever backward up the steps, in a blind, reeling, failing fashion, and stood at last at bay in the doorway of the piazza, with his faithful bodyguard, wounded and bleeding freely like himself, still closing resolutely around him.

'This will do, 'Zekiel,' he gasped out incoherently, as he reached the top landing. 'In the pass of the doorway. Stop them easily. Fire rouse the military. Hold the house for half an hour—help from the governor. Quick, quick! give me the pistol.'

Even as he spoke, a small white hand, delicate and bloodless, appearing suddenly from the room behind him, placed his little revolver, cocked and loaded, between the trembling fingers of his left hand, for the right lay already hacked and useless, hanging idly by his side in limp helplessness.

'Nora, my dear,' the old man sobbed out in a half-articulate gurgling voice, 'go back—go back this moment to the boudoir. Back garden; slip away quietly—no place for you, Orange Grove, this evening. Slight trouble with the plantation blacks. Quell the rioters.—Close up, 'Zekiel.—Close up, Dick, Thomas, Jo, Robert, Emilius, Mark Antony!' And with a quivering hand, standing there alone in the narrow doorway, while the mob below swarmed and pressed up the piazza steps in wild confusion, the wounded planter fired the revolver, with no definite aim, blank into the surging midst of the mob, and let his left hand drop as he did so, white and fainting by his side, with his vain endeavour.

The bullet had hit one of the negro women full in the thigh, and it only served still further to madden and enrage the clamouring mob, now frantically thirsty for the buckra blood.

'Him wounded Hannah—him wounded Hannah!' the negroes yelled in their buzzing indignation; and at the word, they rushed forward once more with mad gesticulations, those behind pushing those in front against the weak yielding wall of Orange Grove servants, and all menacing horribly with their blood-reddened cutlasses, as they shrieked aloud frantically: 'Kill him—kill him!'

The servants still held firm with undaunted courage, and rallied bravely round their tottering master; but the onslaught was now far too fierce for them, and one by one they were thrust back helpless by the raging mob, who nevertheless abstained so far as possible from hurting any one of them, aiming all their blows directly at the detested white man himself alone. If by chance at any moment a cutlass came down unintentionally upon the broad backs of the negro defenders, a cry arose at once from the women in the rear of 'Don't hit him—don't hit him. Him me brudder. Colour for colour! Kill de buckra! Hallelujah!'

And all this time, Nora Dupuy looked on from behind, holding her bloodless hands clasped downward in mute agony, not so much afraid as expectant, with Aunt Clemmy and the women-servants holding her and comforting her with well-meant negro consolation, under the heavy mahogany arch of the dining-room doorway.

At last, Delgado, standing now on the top-most step, and half within the area of the piazza, aimed one terrible slashing cut at the old planter, as he stood supporting himself feebly by a piece of the woodwork, and hacked him down, a heavy mass, upon the ground before them with a wild African cry of vengeance. The poor old man fell, insensible, in a little pool of his own blood; and the Orange Grove negroes, giving way finally before the irresistible press of their overwhelming opponents, left him there alone, surrounded on every side by the frantic mob of enraged insurgents.

Nora, clasping her hands tighter than ever, and immovable as a statue, stood there still, without uttering a cry or speaking a word—as cold and white and motionless as marble.

'Hack him to pieces!' 'Him doan't dead yet!' 'Him only faintin'!' 'Burn him—burn him!' A chorus of cries rose incoherently from the six hundred lips of the victorious negroes. And as they shouted, they mangled and mutilated the old man's body with their blunt cutlasses in a way perfectly hideous to look at; the women especially crowding round to do their best at kicking and insulting their fallen enemy.

'Tank de Lord—tank de Lord!' Delgado, now drunk with blood, shouted out fiercely to his frenzied followers. 'We done killed de ole man. Now we gwine to kill de missy!'

JEWEL AND GEM ROGUERIES.

THAT old saying which tells us there are 'tricks in all trades,' would appear from recent exposures and explanations to be almost more applicable to jewellers than to other traders; and if only one half of the misdemeanours with which they are charged be true, they deserve to be placed in the front-rank of trade tricksters. There are, however, jewellers and jewellers, and although, happily, as a class they are above suspicion, yet, as our courts of justice occasionally reveal, there are also not a few black-sheep in the flock—men who do not scruple to deal in 'doublets' and paste, and who pass off gems and jewels as genuine, that they know to be either altogether false, or to possess some hidden flaw sufficient greatly to lessen their value. Every now and then we find in the newspapers a paragraph or longer article concerning 'mystery gold,' 'forged gems,' or 'false jewels.' Recent examples of this kind of news have appeared to the effect that an important discovery had been made regarding the crown of a foreign potentate, as well as the diamond necklace of a lady of rank, many of the gems in the latter article being made of paste; whilst the diadem of the king is announced to be little better than a theatrical bauble, most of the real stones having been extracted and their places filled with imitation ones. Another announcement of the kind calls attention to the fact of several imitation stones having been found in a jewelled collar

hitherto supposed to be of very great value, and which had been sold by an illustrious person in ignorance of the fact.

'What is paste?' asked a London magistrate, in the course of his examination into a charge of selling imitation stones for real ones. 'Paste, sir,' replied the witness, 'means a mixture of violin glass and borax;' from which, as we have been informed, the closest imitations of diamonds and other precious stones can be made (see 'Artificial Jewels,' *Chambers's Journal*, Nov. 15, 1884). Visitors to Paris who have feasted their eyes on the made-up gems so lavishly displayed in the jewellers' windows of the Rue de la Paix and the Palais-Royal, feel surprised when they are told that four-fifths of the glittering haubles are composed of paste, and are of little value as compared with real gems. It used to be said that most of the jewelry shown in the Palais-Royal was manufactured for use on the stage; but the actresses of to-day, unless obliged to wear paste, will, when they can afford it, adorn their persons with none but real gems. The names of several artists might easily be given who are reputed to be passing rich in diamonds and rubies, and who are possessed besides of pearls of great price. Some actresses, indeed, seem to draw audiences nowadays as much by the aid of their jewels as their talents. When a female star visits the provinces, pains are frequently taken to proclaim the number and value of her gems and jewels. Who, then, wears the paste diamonds and other imitation gems which are manufactured? To this question, an answer of rather a startling kind has more than once been given, and one of the latest may here be noted. A gentleman who was deeply involved in the pursuits of the turf requiring a considerable sum of money to pay his debts of honour, stole his wife's jewels in order to pawn them. To his consternation, the pawnbroker refused to look at them. 'Why?' was feverishly asked. 'Because they are paste.'—'Paste! My wife's jewels paste?'—'Yes. I supplied her with them. The originals are in my safe; I advanced thirteen hundred pounds upon them.' Unfortunately, the gentleman's wife was as great a gambler as her husband, and she had been obliged to pawn her diamonds to meet her own liabilities.

The ingenuity of persons who 'get up' precious stones and mock-pearls for 'the trade' has been often commented upon and frequently censured. A London lapidary who works in the groove indicated was called upon, a few months ago, in a court of law to explain his mode of procedure. 'I make all my imitations out of real stones,' was his reply to the judge. On being asked to be more explicit, he said: 'Perhaps I possess some pale stones which are of small value; these I split by the aid of my tools; then introducing a deeper tone of colour, I join them together again, having considerably increased their saleable value.' In this manner the colours of many stones are said to be intensified, such as emeralds, sapphires, amethysts, and others. Diamonds are constantly utilised by being split, each half of a gem perhaps doing duty on a paste foundation on which it has been carefully mounted. A stone which may be of the value of ten pounds having been split at little cost, is carefully mounted, and becomes transformed into two gems,

each affirmed to be worth that sum. It requires a clever expert to detect such frauds when they are cleverly executed, or to discover that the 'fire' imparted to certain stones that would otherwise be dull of hue and greatly deficient in sparkle, is conferred by so simple an expedient as a backing of tinfoil.

The invention of what are called 'doublets' in diamond-dealing can be traced back for centuries. One mode of getting up false stones has been described by Jerome Cardan, who has published in detail the method of the inventor, one Zocolino. This person's way of working was to procure a thin flake of a very inferior and cheap example of the stone he desired to 'improve,' choosing those which had little colour, and might in consequence be procured at a nominal price. As a bottom for his 'make-up' he took a bit of crystal which he had shaped to his purpose; covering this with a transparent glue with which he had mixed the necessary colouring material, so as to be like the finest specimen of the gem he intended to forge, he carefully fixed on the flake of stone, and concealed the joining of the two so deftly by careful setting as to make purchasers fancy that his gems were not only genuine, but really finer than those of other jewellers. For a time Zocolino flourished, and was enabled by means of his cunning workmanship to deceive the cleverest lapidaries; but detection came at last, and put an end to his fraudulent practices in gem-making.

It may be mentioned as a warning to travellers that the Singalese at Colombo are experts in such frauds, and frequently persuade persons to purchase cleverly set up doublets, or pieces of rock-crystal cut and polished. Doublets in many cases, especially when both parts are really diamonds, are somewhat difficult to detect even by men who have had great experience in the gem and jewel trades. Before leaving the diamond, we may mention another kind of fraud connected with it. Often, when these gems have been set in a cluster, it has been found on examination that at least one of the stones is made of paste, or is perhaps a doublet. A rather curious story went the round of the press some years ago, when, on the death of a lady of title, it was found that more than one-third of the family diamonds were composed of false stones. These imitations had been so beautifully executed that none but the cleverest dealers were able to detect them; while in the case of some of the stones, it was not till their specific gravity had been tested that a decision could be arrived at. It has been found on examination, we believe, that necklaces of so-called real diamonds have often contained twenty per cent. of doublets or other stones of questionable quality. Respectable dealers in jewelry maintain that it is the public who are to blame for the production of false jewels, knowing well enough that genuine gems could not be given at the prices offered for them. Retail jewellers are not seldom deceived themselves, not being, perhaps, so well versed in the technical knowledge incidental to their trade as they ought to be. Tradesmen of repute, however, are exceedingly careful in their selection of stock, no gem being offered for sale unless it is known to be genuine.

Many gems are really gems of a kind, although

not the gems they are pretended to be, but in all probability are composed of pieces of quartz 'got up' for the market, quartz being selected as being able to stand the test of the file, which glass cannot do. There are varieties of topaz and other stones which are as hard as the diamond; and being entirely colourless, they are often cut and polished and successfully palmed off as diamonds. This colourless gem material is costly in consequence of the use to which it can be turned. Recipes for the production of imitation stones have been often given; the following is the formula for a ruby: five hundred parts of strass, twenty of glass of antimony, a half each of purple of Cassius and of gold. Strass is a specially manufactured kind of glass which has been long used in connection with the fabrication of gems; it usually contains a much larger percentage of oxide of lead than the commoner sorts of glass. Aventurine is another kind of gem glass, which is chiefly manufactured in Venice, and brings a high price. The best thing is a quartz of varying shades of colour, which is much prized. One of the scarcer varieties is known as sunstone, and is much sought after, being valuable for such purposes as have been referred to.

Attempts by chemists to produce diamonds have, commercially speaking, usually resulted in failure. The most successful of the early experiments tried in the way of diamond production was that worked out by Gannal, a Frenchman, who in the year 1828 succeeded in producing a substance that was affirmed by a practical jeweller of great repute to be a diamond; but after much controversy, the opinion came to be ultimately entertained that even Gannal had failed. Another famous Frenchman, M. Despretz, made several endeavours in the same direction with partial success; he produced matter at all events with which it was found to be possible to cut and polish the harder gems. A Monsieur de Chaud Courtois has also entered upon various experiments with a view to the production of 'real' diamonds, but, so far as we know, without having achieved success. Mr MacTier's experiments at the St Rollox chemical works in Glasgow have been so recently discussed as not to require farther reference.

The so-called 'Scottish Jewelry' made from cairngorms, cinnamon stone, &c., is largely manufactured in Germany, where most of the stones required are quite plentiful. It is common enough to impose the cairngorm on ignorant purchasers as Brazilian or Mexican topaz. Edinburgh lapidaries are able to prepare and mount the cairngorm and pebbles of Scotland with taste and skill. Crystals of smoky quartz are found in every part of the globe, and can be so skillfully dealt with by lapidaries and experts as to be made deeper or lighter in colour as may be demanded. Each manipulator is of course careful to preserve his particular mode of procedure secret from his fellows; and some of them are very clever in their various manipulations of Scottish stones, which can be set with fine effect in brooches, snuff-mulls, dirks, and powder-horns.

'Mock-pearls' are the subject of frequent discussion. The wonderful lustre and exquisite polish of the real gem of the sea have been more than once imitated with almost the power of

nature. But there is a something about this beautiful and mysterious production which in the end tells against all attempts at fraud. The imitation when tested with the real gem provides one source of detection, and the brittle nature of the manufactured article is another. Another matter is that the exquisitely drilled holes which are characteristic of the pearls of the East are wanting in all imitations, the drilling in the latter case being usually clumsy and blunt-edged. The scales of a small fish known as the *black* have been successfully used in the formation of false pearls; but as it requires some eighteen thousand of these fish to provide one pound-weight of the pearl-making material, it seems superfluous to say that only a very limited number of gems can be made from the scales of the *black*.

Here we pause, not having space left in which to discuss the 'manufacture' of canoes, or the production of that 'mystery gold' which two years ago afforded so much material for newspaper discussion. At the present time, when pictures and pottery, old furniture, articles of vertu of all kinds, coins, and even birds' eggs, are forged, it is not a matter for surprise that spurious diamonds, mock-pearls, and imitations of many of our more precious gems should be foisted on the public by unscrupulous tradespeople. Nevertheless, so long as a lady can purchase for a few pounds a necklace or other adornment which, if genuine, would have cost hundreds or perhaps thousands of pounds, the imitation gem trade will continue to flourish.

A FRIEND OF THE FAMILY.

BY CHARLES GIBSON.

CHAPTER I.—THE MAJOR'S PREDICAMENT.

EVEN his enemies admitted that Major Dawkins was one of the blindest-natured of men. If anybody was in a difficulty, he would take infinite pains to help him or her out of it—provided the difficulty was not financial. In that case he had all the will, but not the means to assist otherwise than with good advice; and the fact was so well known, that nobody ever thought of borrowing from him. Most of his friends were in comfortable circumstances, and therefore above the need of troubling him about pecuniary matters. But his happiness in having wealthy friends was owing to his good luck; certainly not to any careful selection on his part, for he was such a chatty, pleasant little man, so frank and easy in his ways, that he picked up acquaintances everywhere. In a train or on a steamer, he would be in five minutes conversing with his immediate fellow-passengers; in half an hour, they would be discussing subjects of personal interest; and in an hour, they would be talking and laughing together as if they had been intimate for years.

He had sympathy enough to comprehend all beings and all things. He mourned with those who were mourning; he rejoiced with those who were rejoicing. One day he would be at a funeral with visage as lugubrious as his garb; and the day following he would be at a wedding, the gayest of the gay, ready with pretty speeches for the bride, the most flattering prophecies for the bridesmaids, and the heartiest congratulations

for the bridegroom on the fortune which had given him what Solomon had declared to be the greatest blessing on earth—a good wife.

The Major was perfectly sincere in his sympathetic sorrow and in his sympathetic joy; consequently, he was a favourite with both sexes, old and young, and was the confidant of all in many delicate affairs, which could have been entrusted only to one who had proved himself able to keep a secret as well as to sympathise. His little foibles were overlooked, or, at most, provoked a quiet snail at his innocent faith in their invisibility. For instance, nobody ever displayed the slightest consciousness that his well-trimmed black hair and moustache were dyed, although the fact was patent to every one. On this subject the Major was peculiarly sensitive; and for years he cherished the fond delusion that even his man Hollis believed black to be the natural colour of his hair. But accident betrayed the mystery, and from that hour the master was held in bondage by the man.

Hollis had been in several good places at one time as valet, and subsequently as butler. As a matter of principle, he considered himself bound to test the quality of all the liquors in his master's cellar and sideboard; and he had carried this principle of self-sacrifice to his employers' interests to such a degree that he was at length glad to accept the moderate salary which Major Dawkins could afford to pay him for his services as general factotum. Of course, Hollis regarded his new position as a downfall in the world, for here he had to combine the duties of butler, valet, and footman, and there was no cellar at all! But he had a considerate master, and during their frequent stay at country-houses, Hollis's appetites were amply satisfied, whilst he discovered various ways of securing 'tips' which materially added to his income. He might have been as contented as a man of his character ever could be, if it had not been for one grievance.

His master had a nice little box covered with Russian leather and supplied with a Bramah lock. The Major took this box everywhere with him; he always opened it and locked it himself and kept the key in his own pocket. It was not a jewel-case or a cash-box, for Hollis had seen it open on several occasions, and noted that its chief contents were a small green glass and a bottle of peculiar shape without any label. The principle which regulated the life of Hollis was touched: he had no doubt that the bottle contained some special liqueur—in colour it somewhat resembled yellow Chartreuse, as far as he could make out—and he felt much aggrieved that his master would allow him no opportunity of testing its quality. That it must be something very special was evident from the care with which it was guarded.

He watched and waited, and his opportunity came, as it comes to all who wait. The Major was out later than usual one night, and next morning he rose late, which caused him to be much hurried with his toilet, in order to keep an important engagement.

'Back about three,' he said as he hastened away.

When the door closed behind him, Hollis, as was his custom, instantly entered his master's

room.—Did his eyes deceive him? No; the key was in the lock of the little Russian leather case, for once forgotten by its keeper. The man's eyes glistened with satisfaction, and his mouth watered in anticipation of the treat in store for him, as he removed the stopper and filled the dainty glass with the contents of the bottle. It looked nice, but he did not quite relish its faint odour. There was a suspicion of almonds and something else, which he could not liken to anything he had smelt before. Doubtless it was some Indian liquour, good for the liver; people did drink strange stuffs as well as eat strange stuffs in foreign parts. Hollis was not the person to shrink from his duty; he had tasted almost everything in the way of wines and liquours, and he was bound to discover the character of this fluid. He raised the glass to his lips.

'Good heavens! man, what are you doing?' shouted the voice of the Major, raised in extreme alarm. 'That is deadly poison—it is hair-dye!'

The glass dropped from the servant's trembling hand, and he stood abashed.

The Major having discovered his oversight when only a little way from his chambers, had hastily returned, and his latchkey admitted him. Without heeding the broken glass, he angrily locked the case and put the key in his pocket. He was chagrined that in his excitement he had blurted out the carefully guarded secret of the black hair and moustaches; whilst he was relieved by the thought that he had been in time to save the man from the consequences of his folly. He was as much confused as Hollis, and his confusion lasted longer, for the worthy factotum was quick to perceive the advantage he had gained.

Instant dismissal was the penalty that the master first thought of; and the next moment he felt that he dared not inflict it. The man would talk, and in a few hours the scandal would fly up the back-stairs of every house in town. Very likely there would be a smart paragraph in the 'Society' journals making fun of him.

'Dawkins dyes his hair!' everybody would be saying. 'Could you have believed it?'

The poor little Major shuddered at the bare thought of the ridicule which would ensue.

'I'll look over this, Hollis,' he said, drawing up his stiff military collar, in order to appear more dignified and to render his words more impressive. 'You ought to be thankful for that; but understand, if you try anything like this again, or if any hint of this morning's business reaches my ears, you go. You understand?'

'Yes, sir. Thank you.'

'Very well. We start for Todburst Grange to-morrow. Get my things ready to-day.'

Hollis bowed and retired without attempting explanation or apology.

The Major was much perturbed as he drove along the crowded streets to keep the appointment for which he was now a quarter of an hour late. That was disturbing enough to a man of his punctual habits; but it was not the main cause of his present vexation. The main cause was his sense that from this day forth he was, metaphorically, under his servant's thumb.

Observing Dawkins approach for the first time, you would have fancied that he was a youth of

about twenty-five, although he was several years more than double that age. His slim figure, below the average height, was always arrayed in the latest style affected by young men about town. There were a few decorous modifications, certainly, but they were so slight as to be scarcely observable. Then there was a vivacity about his movements which only occasionally suggested a degree of stiffening about the knee-joints, and thus an appearance of juvenility was produced until he was subjected to close inspection. The wrinkles on his brow and under the gray eyes, and the yellow complexion resulting from the touch of liver which he had brought home with him from India, set a stranger speculating whether he was a prematurely aged boy or a very vain old man. But as soon as he began to speak, all speculation on the subject ceased—he was so young in thought, so interested in everything he saw and in every one he met.

The fact was that the Major had not yet realised the truth that he was a grown man and had passed the equator of middle age. He had never been married; he had never suffered under any absorbing attachment to maid or widow; and although he had been twenty years in the army, he had never been in action. A petty riot was the only approach to a battle in which he had ever been privileged to take part. Whilst he bore his disappointment cheerfully, as a general rule, there were times when he lamented the ill luck which had attended him so far as war was concerned. His soul had been always eager for the fray; but fate had denied him any opportunity to distinguish himself on the field. During his twenty years of service in India, there had been battles enough fought and won; but he had no share in any of them. To satisfy his ambition, he had twice exchanged into regiments which were under orders for active service. In the first instance, the orders were countermanded; and in the second—the war was over before his regiment reached the front. So he was gazetted Major, and was 'retired' on half-pay without having sustained a scratch in his country's cause, and without any experience of the proud pomp and circumstance of the big war that makes ambition glorious. He lived in hope, however, that a time would come when the offer of his sword might be acceptable to the War Office. He was then a rabid Jingo, and a resolute advocate of armed opposition to every step made by Russia in the direction of our Indian empire. But he kept these sentiments very much to himself, and only ventilated them when much provoked by some peace-at-any-price man.

The Major's cab rushed along the Strand, along Fleet Street, and up Ludgate Hill, and stopped in Goddenian Street, one of the dingy, narrow thoroughfares which represent the wealth of England. He ascended two flights of dark and well-worn staircases, stopping at a door on the glass portion of which was printed the legend, M. Willis & Co. Entering the office, he was at once shown into the room with the principal, who started to his feet to welcome him with a hearty shake of the hand, although he looked as if his mind were very much disturbed.

'It is very good of you to come so promptly, Major,' he said earnestly, and at the same time endeavouring to assume a careless manner; 'but

I know that you have a regard for the Elliotts, and I am compelled to ask you to help them out of a confounded mess.'

'The Elliotts in a mess!' exclaimed Major Dawkins in amazement. 'Which of them do you mean, the Elliotts of Todhurst or of Arrowby?'

'Arrowby, of course,' replied Willis, with an undercurrent of irritation. 'They are staying at Todhurst just now, and Nellie and Stanley Maynard are there too. You know what a fool my sister's husband John Elliott is, and he has worked himself up into a fit of the most ridiculous jealousy about Maynard and my sister. He is so wild about it that he spoke to me, and wanted me to interfere. I won't, for he is a— Well, I was going to make use of a strong expression; but you can put it down on your own account.'

'He must have been making fun of you,' returned the Major. 'He knows that Maynard is engaged to Nellie.'

'There was no fun at all about it. The fellow was as serious as a man could be. I laughed at him, and tried to reason with him; but it was no use, as you can understand. I should have left the thing to be settled between themselves—for I know Sophy can take care of herself—but he hinted something about having a detective to watch her; and you can guess what a general upset that might mean.'

'The man must be mad.'

'That is my opinion—at least, if he is not mad, he is on the borders of madness. I shouldn't mind a bit if he himself were to suffer the consequences of this nonsense; but, you see, my sister Nellie and Maynard are all likely to get into trouble through his insanity. Will you help them out of it?—I can't. If I say or do anything, it will be misunderstood.'

The Major was silent for a moment. He wished to serve his friends, and yet he was afraid that he, too, might be misunderstood. But he had such a sincere regard for the Elliotts, that he bravely resolved to do what he could to bring about an amicable arrangement.

'I wish you had agreed to do it yourself,' he said reflectively; 'but as matters stand, perhaps it will be better for me to do it. I shall write at once to your sister—Mrs John—to her husband, and to Nellie. Then I shall get down to Todhurst as quick as possible; and I have no doubt that a few words of explanation will set everything right.'

The Major went to his club, and hurriedly wrote several letters. But whilst he was placing them in the envelopes, he was in deep perplexity, for who could tell what might be the result of this correspondence?

The result of the important engagement to which the Major hastened after the scene with his servant was of a most distressing nature. The happiness of friends whom he regarded with profound esteem was in peril, and he had been told that the catastrophe could only be averted by his immediate interference. The information and the intimation were so astounding that he was bewildered. What could he do? How could he find the opportunity, or rather how could he find a sufficiently delicate method of saving those friends from the folly to which they were being hastened by misunderstanding and passion?

The friends referred to were Joseph Elliott, J.P. of Todhurst, to whose place the Major was to proceed on the following day; and the cousin of that gentleman, John Elliott, of Arrowby. The conduct of the latter threatened a domestic imbroglio, in which an outsider's interference was more likely to do mischief than render service. The whole trouble sprang from a foolish misunderstanding, which a sentence of explanation would set right. It seemed very hard to have the power of speaking that sentence, and to remain silent out of selfish considerations of prudence. Nay, was it not wicked to stand by and see the whole fabric of domestic bliss fall into ruins, when by simply giving a timely halloo the calamity might be prevented?

Still, the matter was so delicate that the Major wisely hesitated to meddle with it, although appealed to by the near relative of the two families. Then came the upbraiding question: 'Was he not a friend of the family, respected by them all, and having no interest one way or another, except to do a generous act of service to people who had temporarily lost control of their tempers and judgment?' Yes, he was a friend of the family, the Major admitted with something like a sigh, and there was no doubt it was his duty to open their eyes, and he must do it.

There was a merry party on the large bowling-green of Todhurst Grange playing at lawn-tennis in the sunshine of the autumn afternoon. The players had no intention of making a business of the game by too strict adherence to rules. Blunders were not regarded by this lighthearted party as serious offences, but were laughed at, and explained to the inexperienced. The young folk of both sexes were particular in regard to correct costume, but beyond that they had come out to amuse themselves, to display their graces, to laugh, to flirt—or it might be to make love—but not to strive for any prize except the amusement of each other.

The Major had taken his place amongst the young people, and in his light kerseymeres looked as youthful as his competitors. He was the worst player on the ground, and in that respect distinguished himself by affording the greatest degree of enjoyment to the company. He was perfectly aware of his own incapacity; but, cheerfully declaring that it was never too late to learn, he laughed cordially with those who laughed at him. He, undoubtedly, would have been less buoyant had he been aware that much of the mirth he provoked was due to the droll effect of his earnest efforts to skip hither and thither with the same lightness and ease as his youthful rivals. Of this he was happily unconscious, and so he flourished his racket gaily, and began to think that he would soon be a first-class player. He skipped the more when he observed that Miss Euphemia Panton, the wealthy spinster, was watching his movements from the terrace.

He had made what was, for him, a most dexterous stroke, and stood complacently waiting his turn to play, when a servant approached him and presented a note.

'Beg pardon, sir, but I was told to ask your immediate attention to this.'

'Thank you,' said the Major, putting the note carelessly in his pocket, as he stood smiling on his pretty partner, Miss Helen (in home circles, Nellie) Carroll, who was understood to be engaged to the stalwart young fellow on the other side of the net, and at present her opponent.

The Major admired the clever competition of the lovers; they were so gay and energetic in it, that his mental reflection was that they were really trying the question, as to which should be master in the future.

'I was told to wait an answer, sir,' was the respectful reminder of the attendant who had brought the note.

'In a minute,' replied the Major, as he made one of his funny stiff-kneed skips to meet the ball which came flying in his direction. He managed to catch it on the hop, and sent it far beyond bounds, the feat eliciting loud shouts of applauding laughter. The hero was complacent; he had evidently done something—he did not know what, but it allowed him another pause. So he looked at the note, and the racket dropped from his hand. The deep lines of his visage, which had almost disappeared in his boyish enjoyment of the game, became suddenly prominent in the expression of alarm which took the place of smiles.

'Gracious powers! I have put the letters into the wrong envelopes!'

He looked with anxious inquiry into the bright flushed face of Miss Carroll. No, she had heard nothing yet. He begged that she would excuse him, as he was obliged to hasten up to the house—a message of importance had come for him, and he had no alternative but to curtail the happy privilege of being her partner during the rest of the game. Then, to the attendant: 'Tell Mrs Elliott I shall be with her immediately. Hurry, like a good fellow.'

The man bowed and departed. The Major wiped his brow as he followed, at first with quick steps, but soon more slowly. He was trying to collect his thoughts, and to comprehend the possibilities of the dilemma into which he had fallen.

'She must have got the letter intended for Mrs John; and in that case, what has become of the others? This is a mess!' The thing seemed to be so easy to settle; only a little explanation required, and all would have gone smoothly as ever; and now—who knows what mischief may come of my idiotic bungling!'

He had never before found himself in such a desperate position; but he promptly resolved to take the straight way out of it. He would at once explain his mistake, ask forgiveness, and trust to Mrs Joseph Elliott's good sense and good-nature to keep her silent about the matter which had been accidentally revealed to her.

Accordingly, he entered Mrs Joseph's boudoir with a dejected air, but with the firm step of one resolved to do his duty at any cost. He found the lady standing by her writing-table, with cheeks flushed and eyes uncomfortably bright with excitement. She held an open letter in her hand. She was a plump, fair woman, with soft pretty features, and rather small gray eyes. She was easy-going and good-tempered to a degree, because she had a supreme dislike to be bothered about anything; but, like these easy-

going people in general, once she was roused, she held obstinately to the idea which possessed her, and would not be convinced by any argument that a mistake had been made and that indignation was uncalled for.

'I regret having been obliged to call you away from your amusement, Major Dawkins,' she said, controlling her voice with an evident effort; 'but here is a letter of a most extraordinary nature, which has apparently reached my hands without being intended for them. If I am not very much mistaken, I believe you can give me some explanation of its contents.'

'My dear Mrs Elliott,' the Major answered nervously, 'I gathered from the note I received on the lawn that some blunder had been made. Allow me to assure you—'

'Don't you think it would be as well if you looked at the letter before you proceed further?' was Mrs Joseph's cold interruption. 'I wish to know if this was written by you; and if it was, I shall understand how to proceed.'

The Major held out his hand for the letter; but Mrs Joseph laid it on her desk and held it down, as if unwilling to trust it out of her hand. He glanced at the paper and groaned. It was not necessary to read more than the first words. As he had expected, the letters had somehow got into the wrong envelopes.

'Yes, this was written by me, but it was not intended for you.'

'Of course not,' she exclaimed with a slight hysterical laugh.

'I really do wish you would allow me to explain: there is a mistake—a cruel blunder!'

'I shall seek my husband and ask him to explain.'

'For heaven's sake, don't. He has nothing whatever to do with it. If you would allow me—'

'But I shall not allow you, Major Dawkins, to say another word. You, having made this mistake, wish to screen your friend. But that will not do for me. Whatever you may have to say must be spoken in his presence.'

'If you would only allow me!'

She bowed contemptuously, and passed out of the room, leaving the Major standing with eyes and mouth wide open in hopeless bewilderment. He clasped his brow, stared at the door and at the desk where the letter had lain.

'Why did I not snatch it from the foolish woman, and so compel her to hear me? What mischief have I done! I must get those letters back at any cost. I must see both the Elliotts and explain. They must understand—they must excuse me, for they know my eagerness to serve them. I must get hold of Joe before she sees him.' And he hurried away in search of his host.

The letter which caused so much commotion contained nothing more terrible than this:

MY DEAR FRIEND—Let me implore you to act with more consideration towards Mrs E. The incident which vexes you is capable of the simplest explanation; and if you persist in your present unreasonable suspicions, there is no saying what havoc you may make of your own and other people's happiness. I understand the whole position, and will be glad to set things

right—as I believe it is now in my power to do as soon as we meet, if you will only confide in me.—Yours faithfully,
A. DAWKINS.

This letter had been intended for Mr John Elliott, a morbidly nervous and suspicious man, and it had been placed in an envelope addressed to Mrs J. Elliott, Todhurst. Such a blunder was most irritating; but after all, it could be explained, and the good-nature which had prompted his action could not be understood.

He had himself received a letter intended for another fellow, although bearing his (the Major's) address in full on the envelope. He had even received an epistle from a man of education and intelligence, in which the writer, instead of putting down his own signature, had written the name of the addressee. It was not such a very uncommon blunder for a person who was sending off a number of missives in a hurry. The salve of these reflections afforded only momentary relief to the poor Major's disturbed conscience. The instances of blunders such as he had perpetrated had occurred on trivial occasions, and afforded merriment to all parties when discovered. But in his own case, the happiness of half-a-dozen people was involved, and he was stung by remorse for his carelessness, whilst feeling that he was walking in a dense fog of confusion.

As the Major was rushing in the direction of the stables, in the neighbourhood of which he was most likely to find his horse-loving host at that time of day, he was pounced upon by a troop of young Elliotts. He was a special favourite with the young folk—for who so young as he when amongst them? He was saluted with a chorus of invitations to different games; and it was a little time before he could impress upon them the fact that he could not join them, as he had very serious business with their father. Where was he?

He was half-deafened by the variety of responses, all spoken simultaneously: 'I saw him near the duck-pond; come along, Major.'—'He's in the orchard.'—'He's looking at the new mare in the meadow.'—'He's giving physic to Tally-ho in the stable.'

In desperation, the Major pranced off at random. There was a brief pause among the young folk; then, struck by the idea that their friend was only making fun after all, they gave the view-halloo and followed in full chase, girls and boys competing to be first to run down the quarry. The Major in his gay tennis suit, now somewhat disarranged, panting and flushed, followed by the merry troop, was like a big schoolboy playing at Hare and Hounds—the hare getting very much the worst of it.

'Major Dawkins—Major Dawkins!' called a lady who was standing in his path as he approached her. 'Do, please, stop playing with the children; I want to speak to you.'

It was Mrs John Elliott of Arrowwhy.

The Major, even if politeness had not compelled him to obey, was very glad to halt. He could not have run much farther. The children were around him in a moment, clinging to his sleeves, and laughing in gleeful triumph.

'My dears,' said the Major, gasping for breath,

'I really am in earnest. I do want you to let me off to-day.'

'And—I have something particular to say to the Major,' added Mrs John, as she took the gentleman's arm and led him away from the disappointed group.

Mrs John was a lady endowed with the blissful nature which without effort can under any circumstances realise the spirit of the old saw—

A merry heart goes all the way,
A sad tires in a mile-a.

She seemed to be always laughing; she was as fond of bonbons as a child; and although turned thirty, she was still one of those 'giddy young things' who quite innocently find great satisfaction in attracting the attention of men's eyes. She did not try to do this by extravagance of dress, although it obtained special care. Indeed, she did not try at all; but her blithe, frank ways magnetised men, and she was alike to all, old or young, handsome or otherwise. It had, therefore, caused much amazement that she should have given her hand to John Elliott. Had she mated with his cousin Joseph, the hurly, jovial, red-haired, fox-hunting squire of Todhurst, the fitness of things would have been appreciated. But John—it was incomprehensible.

He was the antithesis of his cousin: bilious, sallow, narrow-chested, and with stooping shoulders. He had no interest in field-sports; he did not keep more than ten acres of his land under his own management; but he was strict with his agent and tenants about rents. He was a dilettante archaeologist, a dilettante book-hunter, and a dilettante philanthropist. He believed that he was in earnest. He regarded his wife as a jewel so precious that every one envied him the possession; and when he came to understand that people wondered why she had married him, he began to wonder too, and the result was much mental torture. He was conscious that she might have had a much more suitable mate, and that consciousness rendered him the more jealously fond. She, although at moments incensed at his folly and want of faith, maintained her good spirits and retained her good looks.

'Now, Major,' she said, in her sprightly way, as soon as they had got beyond earshot of the children, 'I want you to tell me all about this mysterious note you have sent me. I can guess that you mean my husband by "our mutual friend." But who is the "lady," and what is the nonsense to which you ask me to pay no heed?'

The Major absolutely groaned inwardly; for he knew by her allusions that his worst fears were realised, and she had got the note intended for Nellie. So, then, each of the three letters had been delivered to the wrong person! Confound that hurry—confound that fellow Hollis, who had been the cause of it by his mischievous interference with the hair-dye. Had it not been for that incident, the Major was convinced he could never have made such a gross mistake as this. And here was the happiness of a household imperilled by a bottle of hair-dye!

'It may be monstrously absurd to others,' groaned the miserable Dawkins; 'but to me it is monstrously distressing.'

'What is so absurd and at the same time so distressing?' inquired Mrs John gaily, restraining within due bounds her inclination to laugh at the extraordinary contortions of his features.

'My dear madam, I assure you, it is all a stupid and most lamentable mistake on my part. That letter'—

'I am quite satisfied that it is a mistake,' she interrupted. 'Pray, do not feel any uneasiness on that account, and do not bother about the letter. But, concerning the lady, I should like to know something, and you promise here to tell me.' She held the unlucky letter open in her hand.

'My DEAR FRIEND,' it ran—'That is the most appropriate form of address for me to use on the present occasion, which is in my eyes an important one. I beseech you to give no heed whatever to any nonsense you may hear about our "mutual friend" and a certain lady. There is not the slightest foundation for it, and of that I shall convince you immediately after my arrival at Todhurst.—Believe me, your most faithful servant,
ALFRED DAWKINS.'

'You were never intended to receive that letter,' ejaculated the Major with a resolute effort to pull himself together.

'I am sure my husband did not intend it,' she rejoined, smiling confidentially; 'but I thank you for putting me on my guard against idle rumours. It was your duty to do so, as the friend of the family, and I for one am grateful. But it was scarcely necessary; for although John is peculiar in some ways, I have perfect confidence in his discretion, and know that he is incapable of entangling himself with any lady, except through others misunderstanding one of his philanthropic crazes.—Ah, I see what it is; and here her expression changed from that of half-indifferent curiosity to one of serious interest. 'He has been kind to some wretched creature, and she is trying to take advantage of him. That is what you mean by warning me not to heed any nonsense I might hear. Thanks, thanks! I must go at once and relieve his mind of any uneasiness as to my views of the case.'

The Major had endeavoured several times to interrupt her without avail. Now, when he saw her turning quickly away, he cried vehemently: 'Stop, my dear madam; you are quite wrong—you misunderstand the whole affair. Do give me time to tell you exactly what is the matter.'

'I know enough, Major; thank you very much. I must learn the rest from John himself. Here are some friends coming—I do not wish them to see me in this anxious state. We can have a chat in the afternoon.' With a bow she walked quickly away.

He would have followed, but was arrested by a musical voice calling: 'Major Dawkins, I wish particularly to speak to you.'

He turned, and beheld Nellie Carroll advancing hurriedly towards him. Her face was flushed, her eyes bright with indignation, and her sharp firm step betokened that she was in a temper.

Behind her was Stanley Maynard, looking troubled, and evidently trying to persuade her to refrain from some rash action.

CHILDREN'S PLAY.

'O PAPA, when will you die?' asked one of the youngest of my children. A strange question, thought I.

'Why do you ask, my dear?'

'Oh, because it will be such fun burying you.'

This little experience of the author of *Olla Podrida* originated in the death of a pet canary which caused the young people great tribulation. 'To amuse them,' he says, 'we made them a paper coffin, put the defunct therein, and eewed on the lid, dug a grave in the garden, and dressing them out in any remnants of black we could find for weepers, made a procession to the grave where it was hurried.' This little divertissement quite took their fancy, and led them to wish for a repetition on a larger scale.

The memory of a back-garden little cemetery of pet birds and kittens, over whose graves the writer had erected head-slates with appropriate epitaphs, occurs to him after hearing of the late obsequies of a pet rabbit at Southport. Little Amy's bunnie went the way of all rabbits, and her playmates, sympathising with her affliction, determined to give it an appropriate funeral. They arranged a catafalque out of a soap-box, and with great solemnity dragged it in procession to the grave. The children, feeling that a service of some kind ought to be performed, but instinctively recognising the unfitness of the ordinary religious ritual, joined hands around the bier, and sang with dignified pathos the well-known old song, *Oh, bring back my Bunnie to me*. They did it so seriously, and with such child-like good faith, that even the grown-up listeners behind the blinds forgot the bathos of the situation, and involuntarily sympathised with the young mourners in their grief. A 'stepping-stone,' as one of the pall-bearers afterwards described it, was placed over the grave, and the ceremony was over; but even the gorgeousness of the funeral pageant and the impressive hural service could not wholly console the owner for the loss of her rabbit.

A little girl who witnessed the capture of a rat in a trap, exclaimed, with the relentless thoughtlessness of childhood: 'Me wants you to dead him, so me can see him all buried in the eominary'—this playing at funerals being evidently a fascinating amusement with many little folks.

Much has been said about the power of imagination in the young; but their knowledge and experience being so incomplete, is it not rather the imitative faculty that makes a boy with a wooden gun act the hero or hunter, and a girl with a rag doll, an affectionate though rather capricious mother? On their Lilliput stage

children imitate the doings of adults, who are mainly interesting to them as furnishing subjects for representation. They value the reproduction more highly than the realities of life, on which they look callously, and will parody a funeral, an execution, or a prayer-meeting with remarkable cheerfulness. One of the writer's schoolfellows, by way of appropriate 'Sunday play,' once raised an altar of books, placed lighted candles thereon, and tried to persuade some of his companions to join him in further mummeries, which, however, partook much less of levity than earnestness on his part.

A famous American author, who makes some observations which are very apposite, says: 'During a walk from St Nicholas in the shadow of the majestic Alps, we came across some little children amusing themselves in what seemed at first a most odd and original way; but it wasn't; it was in simply a natural and characteristic way. They were roped together with a string; they had mimic Alpenstocks and ice-axes; and were climbing a meek and lowly manure-pile with a most blood-curdling amount of care and caution. The "guide" at the head of the line cut imaginary steps in a laborious and painstaking way, and not a monkey budged till the step above him was vacated. If we had waited, we should have witnessed an imaginary accident, no doubt, and we should have heard the intrepid band hurrah! when they made the summit, and looked around upon the magnificent view, and seen them throw themselves down in exhausted attitudes for a rest in that commanding situation.' The same writer says: 'In Nevada, I used to see the children play at silver-mining. Of course the great thing was an accident in a mine; and there were two "star" parts—that of the man who fell down the mimic shaft; and that of the daring hero who was lowered into the depths to bring him up. I knew one small chap who always insisted on playing both these parts—and he carried his point. He would tumble into the shaft and die; and then come to the surface and go back after his own remains.'

If half the accounts of American children are true, they must be intolerable little precocities, hard to manage and difficult to please. Japan appears to be the children's paradise, from recent accounts. In no other country, we are told, are the young people treated with such consideration. The third day of the month is the girls' festival. In every family you will find dolls in large numbers arranged in one of the rooms reserved for that purpose. The boys' holiday is the fifth day of the fifth month. After passing under the barber's hands, the boys, dressed in their best clothes, first go to the temple and offer a prayer, after which the fun of the day begins.

The ways of children are, it seems, beginning to be studied from a scientific standpoint. An American lady has elicited from two hundred and twenty-seven Boston schoolboys particulars

of their tastes in collecting. Out of the entire number, only nineteen had abstained from making collections. Stamps were the most popular objects; then marbles, business cards, minerals, woods, leaves or flowers, autographs, huttons, birds' nests, and many other articles.

There is often a great contrast between the ways in which boys and girls try to amuse themselves. Games which demand small exertions are generally girls' favourites, though the more active take kindly to rounders, whiptop, and even cricket. But as a rule they are soon tired; everything 'isn't fair,' and they 'won't play.' Boys' games are more successful. Boys stick much more to rules, and are less careful of their clothes. Their games are often accompanied by loud threats and fierce recriminations, threats which if executed would speedily make the playground present the appearance of a battle-field.

It is the grown-up people who write the stories, and the children carefully preserve the text. What hoy has not had his Crusoe raft or cave, or has not attempted to build a log-butt? The business, pleasures, misfortunes, and adventures of life are all relished by the romantic little people. There is a story of Michael Angelo making a statue of snow in a garden, the beauty and proportion of which delighted his companions and gave promise of the genius he was afterwards to display. Charles Dickens tells us of wandering through rooms when a child, armed with a club, in the make-belief that he was an African traveller expecting to be attacked at any moment by wild heathens or savages, and therefore holding himself ready to sell his life as dearly as possible.

This innate tendency to mimicry is sometimes even displayed amongst the melancholy surroundings of a hospital. It must, indeed, be sadly dull for the poor little patients in a children's hospital, but there are rays of sunshine that gleam upon the scene. A kind-hearted visitor to one of these institutions says: 'Among the boys, I saw one merry little fellow gravely putting out his tongue, while another felt his pulse. Playing at doctors seemed a fit game for a children's hospital, and I could picture to myself how mock prescriptions were made up with sham solemnity of manner, and how fanciful experiments with imaginary stethoscopes were attempted by young actors, to beguile the weary time. One little girl I spoke to seemed quite proud of her acquaintance with the ailments of her neighbours, and seriously took me to a bed to see a bad case of "bronchitis"; and to a cot contiguous, where what she called "new-money-here" was waiting to be cured. To lip out big words like "tooth-ache" appeared to give great pleasure to the solemn little doctors, and I fancied the patients felt some pride in being pointed out as victims of such fine-sounding complaints.'

Children who have few toys are thrown on their own resources for amusement, and frequently develop great ingenuity and cleverness in their play. We have examples in the young Brontës, busy at their desks and playing at being editors, like the girls in *Little Women* when producing their weekly paper *The Pickwick Portfolio*. But when our little actors, in their

eagerness to secure properties, develop the bump of destructiveness, the results are not so amusing. Captain Marryat remarks that children are a great blessing when they are kept in the nursery; but they certainly do interfere with the papa who has the misfortune to be an author. He little thought, when his youngest girl brought him a whole string of paper dolls, hanging together by the arms, that they had been cut off his memoranda. But it was; and when he had satisfactorily established the fact, and insisted upon an *inquisition* to recover his invaluable, he found that they had had an *auto da fé*, and that the whole string of dolls, which contained on their petticoats his whole string of bewitching ideas, had been burnt like so many witches.

The monkey-like propensity for imitation which makes an infant try to shave himself on getting hold of papa's razors, when developed in boyhood, takes the form of unrepentant smoking and swaggering, more for the purpose of acting the men than for anything else. The same idea of acting the woman is shown when little girls improvise a long train out of a newspaper or shawl, and sweeping in a dignified way about the room, exclaim, 'I'm memma!'

The importance of a child when lent any article of dress, a stick, or an umbrella to play with, is very noticeable. 'Little boy,' said e gentlemen, 'why do you hold that umbrella over your head? It's not raining.' 'No.'—'And the sun is not shining.' 'No.'—'Then why do you carry it?' 'Cause when it rains, father wants it; and when the sun shines, mother wants it; and it's only when it's this sort of weather that I can get to use it at all.'

Children possessed of mimetic qualities are happier without any playthings than are their opposites, even when possessed of the costliest scientific toys. Town boys are fond of imagining themselves to be trains and horses, the noise of the former and motions of the latter being often very amusingly represented. Mark Twain has given a lively description of an American lad imitating a river steamer with all proper accompaniments of bell-ringing, going ahead and astern, and whirling one arm round for an imaginary forty-foot side-wheel coming alongside the wharf. The same humorist's description of some boys camping out on an island, and covering their bare bodies with mud to represent Indian war-paint, will probably occur to our readers.

Any one who has ever watched street boys at play, must have been struck with the power of mimicry many of them possess. The writer was once greatly amused by the antics of a London lad, who along the kerbstone was 'taking off' the motions of a tight-rope performer, with most ludicrous attempts at balancing, and a perfect burlesque of reality, that elicited roars of laughter from his admiring companions, some of whom whistled an appropriate accompaniment. Stage struggles and combats, and the ways of heavy tragedians, clowns, nigger minstrels, and acrobats, are often travestied by these youngsters in a way that denotes remarkable cleverness and keen observation. A Volunteer review which the writer witnessed in Cheshire was almost turned into ridicule by the absurd antics of some scores of the street arsh genus. As a long

line of riflemen advanced, firing, clouds of young ragamuffins kept retreating at some distance in front, and at every volley threw themselves on the ground into all kinds of grotesque attitudes, representing the killed and wounded. Boys' sham-fights amongst themselves sometimes become rather serious, through the actors waxing too earnest in their enthusiasm. It is not long since a boy was wounded by a pistol-shot when enacting one of the Soudan battles with his companions. Newspaper readers are familiar with accounts of the lamentable results of children playing at hanging not wisely, but too well.

AFTER AN EXPLOSION.

AN opportunity was recently afforded us of exploring the workings of a colliery in which, a day or two previously, an explosion had occurred. Commonly, the results of these catastrophes are so widespread, and the havoc they cause is so tremendous, that it is impossible to take a calm survey of the separate effects of fire and concussion: all is mere ruin and confusion. But in this particular instance the area affected had been very limited; and so little damage had been done to the roofs and roads, that it was safe and easy to investigate the way in which the imprisoned forces had effected their deadly purpose; for nearly half the men at work in the vein of coal had been killed, and, of the rest, several narrowly escaped with their lives. And yet the mine had always been considered a perfectly safe one; no death from fire-damp had ever before happened; and, with the full approval of the government inspectors, naked lights had always been used. All at once, without any warning, the lightning-swift flame darted forth, none knew whence, and many a miner's home was filled with desolation and sorrow.

We were, of course, provided with safety-lamps before we reached the branch road which leads to the workings where so lately such awful scenes had been enacted. Even here, nearly two hundred yards away, we were shown a hole which had been blown through eighteen inches of solid masonry; and were told that two men who were at the *outside* of this wall had been severely burned, one of them, after lingering for a week, having succumbed to the injuries received. Just round the corner, only a few yards away, we saw the ghastliest sight of all that met our eyes in this memorable round. A dark stain on one of the upright supports of the roof marked the place where a man's head had been crushed by a loaded tram, which the concussion of air had lifted off the rails and dashed against the hapless trammer. Nothing could give one a more vivid conception of the terrific force of these gaseous explosions, and of the enormous expansion of air which they occasion.

But we proceed along the level road through which so recently that fiery blast rushed, and reach the door which opens into the actual scene of the disaster. It was from this point that the

gallant band of rescuers—who in such emergencies are always ready to risk their lives in helping others—carried on their operations. Outside this door, all was safe after that one momentary onrush of flame was over. Inside lay the deadly choke-damp, hardly less fatal than the fire itself. Yet, for all that, one by one the injured colliers were carried hither and placed in the freer air. Then the heroic searchers bore out also the bodies of the dead; and not till then, yielded to the numbing, stifling influence of the poisonous vapours, which left them aching and ill for days.

What a contrast to all this was the quietude of these deserted workings as we saw them! Save for such repairs as were needed to restore proper ventilation, nothing had been touched; and, strewn on the ground, as they had been taken off by their owners—since dead, or, it might be, struggling for life—lay the coats and other garments discarded as too cumbersome to work in; while from the roof hung the miners' 'tommy-hags,' containing their day's food. One had fallen on to the ground, and the mice had got at it. After biting a hole through the covering, they had gnawed away all the crumb out of a huge hunch of bread. Where, one wondered, could these tiny creatures have taken refuge from fire and suffocation? Mysterious indeed! Not a single, not even the smell of fire, on these trivial things; and yet, herabouts, a man was found fearfully scorched, his clothes literally torn off him by a tornado of flame!

Passing on to a heading where several men met their death, we noticed one larch-post out of which the resin had been drawn by the intensity of the heat; while everywhere, one side of the props was coked over by the rush of burning coal-dust, which had been driven furiously along, now in one direction, now in another; and yet, among it all a pale-green shoot sprouting from an ash-pole in the roof, turning upwards, as if some instinct taught it that *that* way shone the sunlight—even though a quarter of a mile of rock lay between!

Another example of the incomprehensible manner in which these fatal forces act. A door which opened inwards, and so offered full resistance to the concussion, was smashed into splinters; and yet, twenty yards farther on, a miner was at work with a candle in his cap; and this was not blown out, nor was the man at all hurt! This particular doorway, the door being fortunately demolished, let in a quantity of pure air, and so the lives of a number of men who were in that level were saved. One specially touching incident occurred here. Two men and a boy started to crawl to a place of safety, following, with their hands, the rails as a guide in the darkness. The road they took is in the shape of a Y. When they reached the fork, two of them took the right turning, and escaped unscathed. The third man went to the left, and wandered on till, in the very thickest of the afterdamp, he sank down and died. There he was found, as soon as it was possible to penetrate through the smoke and heavy fumes, with that placid look on his face which all those wear who are suffocated by carbonic acid gas. One of the explorers explained that, in this poisonous atmosphere, he felt himself failing, and yet, though he knew perfectly

what was in store for him if he sank down, *could* not resist the pleasant stupor that was creeping over him. He was dragged away to pure air just in time.

Our guide tried, with his testing-lamp, all round the place for gas; but only once, in a hole in the roof of the highest level, did a tiny blue cap within the wire-gence demonstrate the lingering presence of that explosive vapour. This fact may to some extent explain the unwillingness of the workmen to use safety-lamps. Such is the ignorant prejudice which prevails among them, and so true is it of them, as of all people engaged in hazardous occupations, that familiarity breeds contempt for danger. They were perfectly ready to go down with candles, but *not* with lamps, to which they had never been accustomed. But we owe too much to these toilers underground, to indulge in harsh criticism of their conduct. As the poor fishwife described her herrings, so we may call the coals which blaze upon our hearths, 'the lives of men.'

From this account of what, after all, was but a slight explosion, one may perhaps more readily realise the awfulness of those more extensive disasters, which, with equal suddenness and mystery, plunge whole districts into bitterest grief and direst want. If any stimulus to sympathy and practical charity were required, it would but be needful to stand, as we did, among that eager crowd which, at the tidings of evil, thronged round the pit top; and to see those agonised women who were weeping for their sons or husbands, and 'would not be comforted, because they were not.' But the hearts of Englishmen ever beat fast, and their hands ere always open, when they are asked to help the ill-fated colliers' widows and orphans—'after an explosion.'

OCCASIONAL NOTES.

INTERESTING DISCOVERIES.

A REPORT reaches us through a Greek paper of the accidental discovery, in the island of Syros, of three graves, the structure and contents of which would point to a very early prehistoric date. It was during the digging for the foundations of a new building in the town of Hermonopolis that these graves were brought to light. The vessels found in them are in good preservation, and are, with one exception, of wood or earthenware, and this exception is a vase of metal, in which are the ashes of a dead man. The other graves also exhibit, without any exception, unburned bones, thus showing a curious combined system of ordinary burial and cremation, the bones in the vase having been burned, and the others not so. Votive offerings were placed about the skeletons in every case, those which were apparently of the greatest value being found in the dead men's hands. It is to be hoped that the vessels may be secured for the Athens Museum, already so rich with many such curious relics. This Museum has been lately enriched with the remains of the pediment sculptures of the Temple of Athens. Also at Tegea. These precious fragments, consisting of two heads of youths and one head of a boar, are the only pieces of sculpture which can be

affirmed, with confidence, to be the work of Scopas; and it is a satisfaction to know that archaeologists and antiquaries who desire to view the relics of highly refined art of past ages, may see them in this Museum without that trouble of going to Tegea. It is also reported that the missing half of one of the other heads lately discovered has been found, and is now safe in the same Museum. Another exquisitely beautiful head of a female, found some years ago at Lerna, has been procured for the National Museum, thanks to the zeal and energy of the Director, Dr Kabbadias. The head is life-size, of Parian marble, and evidently, from the flat unworked state of the back, formed part of a group in high relief, and dates probably from the third century before Christ. The learned are in much doubt as to whom the head is intended to represent, many inclining to the opinion that it is Demeter, from its charming expression and pathetic beauty; but as no part of the figure remains, this is, after all, mere speculation.

METROPOLITAN PUBLIC GARDENS' ASSOCIATION.

North, south, east, and west, the growth of London proceeds rapidly. Not only is the city's area increased, but the brick and mortar maze of which it consists tends to grow denser and denser, as the nice arts of surveyor and architect combine to wrest from space its fullest building possibilities. And hence springs a great evil. Fresh air and light—necessary conditions of healthy life—are meted out to the population with an ever-increasing meagreness. But, happily, counteracting influences have now existed for some time. A notable one is embodied in a philanthropic Association, which expends a considerable income and great activity in obtaining for the people of London open spaces, or gardens, and other machinery for recreation. Old churchyards and other disused burial-grounds, inclosed squares, and vacant plots of ground of all sorts, are the 'prey' of the Metropolitan Public Gardens' Association. Finding them, it at once agitates obstinately for their consecration to public use. Parochial and ecclesiastical local authorities, and in some cases private individuals, are appealed to, to devote the land to the desired purpose—the Association offering to lay out the inclosure at its own expense, and provide the necessary implements, plants, mould, drains, seats, &c., or making such overtures as the individual circumstances of the case may justify. Though securing public recreation-grounds is the chief aim of the Association, it adopts other means for promoting the health and physical well-being of the people. Thus it agitates for the establishment of gymnasia in elementary schools, and for the opening of school playgrounds during all but scholastic hours to the children of the surrounding locality; it plants trees and places seats in the wider thoroughfares; it uses its influence to obtain the erection of baths and washhouses; and, collecting reliable information respecting all the poorer districts of the metropolis, it directs public attention to overcrowding and other social evils. Since the Association's formation in 1882, it has succeeded in eighty-three of its efforts to provide public recreation-grounds, &c., disbursing in this work

\$8595, 15s. 5d. Lord Brabazon is the chairman, Miss I. M. Gladstone, the honorary Secretary, and Miss F. Wilkinson, the landscape gardener of the Association, the address of which is 83 Lancaster Gate, London, W.

'MISSING.'

'Twas after Talavera, on an evening dark and gray;
We had returned from the fight, after a bloody day;
And we called the muster over; but one answered not
the call:
'Twas th' youngest, and the noblest, and the bravest
of us all.
He had dared the direct dangers of that dread and
dread-bought day,
For he had been the foremost in the fury of the
fray;
But a solemn silence answered when we called him on
the roll,
And we knew that we had lost him—and that heaven
had gained a soul.

This night was closing chill and dim, and stars were
in the sky,
When forth we went to look for him—the battle-field
was nigh;
The moon shone out to aid us in our grim and ghostly
quest,
As we turned the brave men over that wore lying
there—at rest.
Where the fight had waxed the fiercest, on the margin
of the field,
We found him, grasping hard the sword he never more
might wield!
There was glory on his visage, like a rosy light, or
flood,
Though his golden hair was dabbled with his swiftly-
flowing blood.

Oh, reverently we lifted him, and wiped away the
stain
That marred the bright young forehead, where a
mother's kiss had lain.
We loosed the things about his breast, but turned
aside—for there
We saw a maiden's picture, and a tender lock of hair!
He was not dead: he strove to smile; he lifted up his
hands—
But Death had turned the hour-glass, and was counting
out the sands!
We were rough and hardened soldiers, and we could
not mourn, because
He was dying for his country—like the hero that he
was.

We laid him on the litter; but he neither spoke nor
moved;
And tenderly we bore him to the comrades that he
loved.
He was dead long ere we laid him on the mossy patch
of ground—
But we hoped he did not suffer—for he died without
a sound!
We have bled in many a battle, we have fought in
many a fray,
But that night at Talavera is as fresh as yesterday;
And his name upon the muster-roll in fancy oft we
call,
For we loved him, as the noblest and the bravest of
us all.

THE DEATH-ROLL OF MONT BLANC.

IN these days, when it is the fashion to decry Mont Blanc, in company with a good many other old institutions, there is one thing about the mountain which is apt to be lost sight of, and that is how very fatal it has been to mountaineers. It is quite possible that the proportion of killed to those who succeed in the ascent—and the same will hold good in respect of any other Alpine peak—would not be found to be great, for probably more people have gone up Mont Blanc than any other high mountain; but no number of successful ascents will minimise the fact that there can be very real danger on Mont Blanc. The causes of danger are not far to seek. The mountain is regarded, and in fact is, comparatively easy of ascent, and from the days when Albert Smith did so much to dispel the awe with which it was once the fashion to regard it, the popularity of the expedition has grown year by year, till quite a considerable percentage of those who now go to Chamouni consider but the half of their visit accomplished if they fail to 'do' Mont Blanc. Thus it comes to pass that a great number of individuals are allowed to ascend who ought not to go on the mountain at all, and who, under certain conditions, may easily become a source of danger to themselves and to those who accompany them.

But the danger from this cause is as nothing compared with that which exists in the inferior quality of many of the guides. At Chamouni, every one who styles himself a guide must belong to a kind of trades-union society called the 'Compagnie des Guides,' and presided over by a 'Guide-chef.' All who enter the 'Compagnie des Guides,' good, bad, and indifferent, enter it on the same footing, and are compelled to take their turn for an engagement on a register kept at the office of the 'Guide-chef' for the purpose. Thus, a traveller who wishes to engage a guide, is not allowed—except under very special circumstances—to choose his man, but must take him whose name stands first on the list; and it may so

happen that quite an incompetent individual is given charge of a party wishing to ascend Mont Blanc, while a really good guide is told off to carry a knapsack over the Col de Balme.

It is easy to imagine what may result from a system such as this. For one thing, it has had the effect of utterly demoralising Chamouni guides as a body; and it has been the means, as we shall see presently, of some of the worst accidents that have ever happened in the Alps. It is usual nowadays for members of Alpine Clubs to bring to Chamouni their own guides from other districts, rather than trust to the local men; and so it has come about that Chamouni guides have been reduced to taking casual parties up Mont Blanc, with the result, that very few of them are of any use out of their own particular district, and as regards the more difficult peaks of the range, very little even in it. In fact, it is hardly an exaggeration to say that the really good Chamouni men may now be counted on the fingers. The grave scandal occasioned by the desertion of the Russian, Professor Fedchenko, by his guides—two inexperienced boys—and his subsequent death on the Mer de Glace, called forth a severe protest against the Chamouni guide system on the part of the Alpine Club; but beyond some slight modification of the rules as regards the choosing of special men, very little has been done; and to this day the Rules and Regulations of the 'Compagnie des Guides' of Chamouni remain a byword with all mountaineers.

Finally, there is the danger—and this perhaps greatest of all—from weather. Easy though Mont Blanc may be as long as the weather is good, there is not a mountain in all the Alps which can become so dangerous in a storm. Every one who has had experience of climbing, knows how weather can affect a mountain, and how an ascent which is easy enough one day, may become dangerous if not impossible the next. It is quite a mistake to suppose that because a mountain offers no physical difficulties, that there is no risk attending the ascent. We have Mont

Blanc as a case in point. Easiest of all the Great mountains, he has proved himself the most fatal of any.

The first accident within our knowledge which occurred on Mont Blanc was that to Dr Hamel's party in 1820, and being the first accident to Alpine climbers, it created at the time an immense sensation. From accounts published by the survivors, it seems clear that the accident was caused by ignorance of the state of the snow—ignorance excusable enough in those days, when as a matter of fact the art of climbing was very little understood. On August 18, 1820, a Russian professor, Dr Hamel; two Oxonians, Messrs Durnford and Henderson; a Genevese named Sellique; and twelve guides, left Chamouni, and in twelve hours—about double the time now taken—reached the rocks of the Grands Mulets. Here they pitched a tent which they had brought with them, and passed the night. Bad weather came on after sunset; and as it did not clear next morning in time for them to start, they had to pass another night in the tent. It came on to rain again in the evening; but the following morning, August 20, was fine, and it was determined to make a push for the summit. At this juncture, M. Sellique was overcome with 'scruples' on the subject of making the ascent, and declined to accompany the others, so he was left behind in charge of two of the guides. The rest of the party set out at five A.M. The weather kept fine; but the snow—to quote one of the survivors—was found to be 'rather too soft.' They would appear to have followed the line of ascent usually adopted in these days, until opposite the Dome du Goûté, and on a level with it, when they branched off sharply to the left, and commenced to traverse a steep snow-slope, directing their course straight for the Mont Maudit. They were not roped, and were apparently proceeding in Indian file, when suddenly the snow gave beneath their feet, and carried them away bodily down the slope. They were all carried a great distance—some accounts say twelve hundred feet—and then the whole avalanche buried itself in a great crevasse. The three leading guides were completely overwhelmed; but the rest of the party stopped short of the crevasse, and were saved. The survivors made frantic efforts to rescue their unfortunate companions; but the poor fellows must have been buried under many tons of snow, and these efforts were availing.

It was scarcely thought probable that traces of them would ever again be found; but after the lapse of nearly half a century, the glacier yielded up its dead. In 1863, or forty-three years after the catastrophe, portions of human bodies, the debris of a lantern and Alperstock, and the leaves of a Latin book, were found imbedded in the ice on the surface of the Glacier des Bossons and near its foot. They were recognised as belonging to the lost guides of Dr Hamel's party. Further discoveries were made in the two following years; and of the relics thus brought to light, some are preserved to this day by the Alpine Club in their rooms at St Martin's Place.

This accident afforded strong evidence in

favour of the fact of glacier motion, for the remains were found to have been carried by the ice a distance of nearly five miles from the spot where the catastrophe occurred.

Almost simultaneously with this finding of the relics of Dr Hamel's ill-fated expedition, occurred another accident on Mont Blanc. On August 9, 1864, a young porter named Ambrose Couttet, while accompanying two Austrian gentlemen in the ascent of Mont Blanc, fell into a crevasse on the Grand Plateau. This was an accident attributable entirely to carelessness, for it appears that at the moment of the catastrophe Couttet was walking apart from the others and quite unattached. His companions did their best to effect a rescue; but the crevasse was of such great depth that they could not come near him. A party of guides subsequently went out with the object of recovering the body; but although two of their number descended ninety feet into the crevasse, they failed to reach it. It is almost certain, from the terrible nature of the fall, that the unfortunate man's death must have been instantaneous.

There were two sad accidents on Mont Blanc in 1866. The precise cause of the first is somewhat obscure, but the facts as far as they are known are these. Sir George Young and his two brothers, unaccompanied by guides, set out to ascend Mont Blanc on August 23, and succeeded in reaching the summit in safety. They had not proceeded far in the descent, when, for some reason unexplained, one of the party slipped and dragged down the other two. They alid for a short distance, then fell a height of twenty feet or so, and were finally stopped by soft snow. Sir George and his second brother escaped serious injury; but the youngest brother, Mr Bulkeley Young, was found to have broken his neck.

The accident to Captain Arkwright's party was of a different description, and in many respects bears a close resemblance to that in which Dr Hamel's guides lost their lives. On the 13th of October—unusually late in the year for such an expedition—Captain Arkwright with one guide, Michel Simond, and two porters, started from the Grands Mulets to ascend Mont Blanc. At a little distance they were followed by the landlord of the *Pierre Pointue*, Silvain Couttet, and a porter—these two having apparently come for their own pleasure—on a separate rope. The guides, probably by reason of its being a shorter route, and, as such, likely to save time—an important matter at that season of the year—chose the route adopted by Dr Hamel's party, and which had come to be known by the name of the Ancien Passage. They had almost reached the spot where the disaster of 1820 occurred, when the roar of an avalanche was heard. Couttet and his companion, realising the danger, fled for their lives. They were a little way behind the others, and were so fortunate as to escape; but Captain Arkwright and his guides were caught by the avalanche and swept away. This accident arose from precisely the same cause as that which happened to Dr Hamel's party—ignorance of the state of the snow; but it differed in one respect: whereas Dr Hamel's party started the avalanche, the avalanche which proved fatal to Captain Arkwright and his guides fell from above.

The fact of a second accident occurring at the same place and from a similar cause, has given to the Ancien Passage the reputation of being essentially unsafe. It is not necessarily more dangerous than other routes, and indeed it may even be the safest route from Chamouni up Mont Blanc. It is only really dangerous when the snow is in bad order; and this is a point upon which a guide is—or should be—competent to give an opinion. On the day of the accident, the snow was not in proper condition, and it was because a right discretion was not used, that Captain Arkwright and his companions lost their lives.

We now come to an accident which ranks as by far the most terrible which has ever happened to Alpine climbers, for it resulted in the loss of no fewer than eleven lives. On September 5, 1870, a party consisting of two American gentlemen, Messrs Beane and Randall, and a Mr MacCorkendale, with eight guides and porters—with one exception, all Chamouni men—left Chamouni with the intention of ascending Mont Blanc. They passed the night at the Grands Mulets, and next morning started for the summit. Early in the afternoon, a violent storm burst over Mont Blanc; and as the weather became very bad and they did not return, it was resolved to send out a search-party from Chamouni. The weather, however, continued for some days of such an unfavourable character that it was not until the 17th, and when all hope had been abandoned of finding any of the lost party alive, that a discovery was made. The dead bodies of Mr MacCorkendale and two of the porters were first found. They were lying on the snow quite uninjured, head uppermost, a little way above the Mur de la Côte; and from the torn condition of their clothes, it seemed probable that they had slid some distance to the spot where they were discovered. Higher up, lay the bodies of Mr Beane and another porter, with the greater portion of the baggage beside them. Of the remaining six, no trace could be seen. A few small articles which must have belonged to them were picked up subsequently in the direction of the Brenva Glacier; but that was all. To this day their fate remains a mystery.

The only light thrown upon the catastrophe was that which could be gathered from the pages of a diary found on Mr Beane, and written by him. Some doubt at first was cast upon the authenticity of the entry, but there seems no reason at all for disbelieving its genuineness. What it told was as follows: '*Tuesday, September 6.*—I have made the ascent of Mont Blanc with ten persons—eight guides, Mr MacCorkendale, and Mr Randall. We arrived at the summit at half-past two o'clock. Immediately after leaving it, I was enveloped in clouds of snow. We passed the night in a grotto excavated out of the snow, affording very uncomfortable shelter, and I was ill all night. *September 7 (morning).*—Intense cold, much snow, which falls uninterruptedly, guides restless. *September 7 (evening).*—We have been on Mont Blanc for two days in a terrible snowstorm; we have lost our way, and are in a hole scooped out of the snow, at a height of fifteen thousand feet. I have no hope of descending. Perhaps this book may be found and forwarded. . . . We have no food; my feet

are already frozen, and I am exhausted; I have only strength to write a few words. I die in the faith of Jesus Christ, with affectionate thoughts of my family; my remembrances to all. I trust we may meet in heaven.'

The diary ended with instructions to his family as to his private affairs.

It is to be regretted that poor Mr Beane gives us so little information of any practical value; but meagre as his diary is, it sheds light on one or two points. First, we gather that the party actually reached the summit; and next, that it was about half-past two in the afternoon, and immediately after leaving it, that the storm caught them. Now, how was it, we may fairly ask, that so little progress was made on the downward path?—for the ice-grotto of which Mr Beane speaks was constructed at an altitude of fifteen thousand feet, or only seven hundred and eighty-one feet below the summit. How was it that the guides failed completely to find a way back over ground which they had traversed so recently? Mr Beane does not tell us if any attempts were made on the 6th and 7th to find the way down—what little evidence we have tends to prove that there were none—he merely says, 'We have lost our way.' To sit down and wait where they were, as they appear to have done, showed a want of judgment which, without being better acquainted than we are with the facts of the case, seems quite inexplicable. Nothing is more common in the high Alps than to be overtaken by bad weather; but out of the Chamouni district there has not been an instance of a whole party perishing from this special cause. It is difficult to avoid the conclusion that the guides were not equal to their task, that they lost their heads at the very approach of danger, and gave themselves up for lost at the moment when they should have made the most determined effort to escape.

There was another circumstance, too, which was held at the time to reflect somewhat upon the conduct of the guides—not one of their bodies was found. The five bodies recovered were those of the *heaviest* members of the party, and there can be little doubt that they must have been left behind, while the rest made an effort to save themselves. Mr Beane, however, makes no mention of any division of the party, and it is charitable to suppose that no division actually took place until after the weaker members had succumbed to the exposure. What led to the division, will never be known; neither will it be known what motive impelled the guides to act in such an utterly incomprehensible manner. That the leaders of the party *ought* to have been thoroughly up to their work, is emphasised by the fact, that neither Mr Beane, Mr Randall, nor Mr MacCorkendale had had previous experience of mountaineering, and were quite incapable of giving advice of any practical value when difficulties arose. As a matter of fact, it does not appear that any one of the guides held a foremost place in his profession. Judging by their actions, they certainly proved themselves singularly wanting in many of the most important qualities of good guides; and it is impossible to believe that they could have been other than very second-rate. But should the blame of the disaster be laid to their charge? Should it not

rather attach to a system which rendered such an accident only too probable?

In the same year (1870) there was yet another accident on Mont Blanc. A gentleman and two ladies, accompanied by a guide and a porter, were out on the mountain; and the gentleman wishing to go further than the ladies cared to, took the guide, and left them in charge of the porter. With what object, it is not known, the porter promptly proceeded to conduct his charges across a snow-field which was well known to be honeycombed with concealed crevasses. Under these circumstances, it would have been only wonderful if an accident had not occurred, and unfortunately that took place which might have been predicted. The porter had given his arm to one of the ladies, and was leading her across, when the snow gave way beneath them, and they both fell headlong into a deep crevasse. Here was a case of two lives wantonly sacrificed. That any one calling himself a guide should have shown such gross ignorance of the very first principles of mountaineering as this porter did, is almost inconceivable. It is perfectly clear that he did not understand his business, and was certainly not a fit person to have been sent on expeditions above the snow-line.

A still later accident on Mont Blanc took place on the south side. On the 30th August 1874, Mr J. A. G. Marshall, with two Oberland guides, Johann Fischer and Ulrich Almer, left Courmayeur with a view to attempting the ascent of Mont Blanc by way of the Brouillard Glacier, an ascent which had not at that time been effected. They camped out upon the mountain at a height of about ten thousand feet, and the following day worked their way a considerable distance upwards till they found themselves finally stopped by an impassable wall of rock. This occurred somewhat late in the afternoon, too late, indeed, to attempt any other route, and accordingly they turned back. The descent was difficult, and night overtook them before they reached the spot where they had bivouacked the previous evening. They were crossing the last bit of glacier, when Fischer inquired the time, and Mr Marshall drew out his watch, while the others came up to him with a light. As they stood thus close together, the snow gave way beneath them. Fischer fell first into a crevasse which at this point was some thirty feet deep and five feet in width; and Mr Marshall was dragged on to him; while Almer alighted upon a hummock of snow but a few feet below the mouth of the crevasse. Mr Marshall's head came in contact with the side of the crevasse, and in his case, death must have been instantaneous; while Fischer's injuries were of such a character that he, too, could not have lived for any time after this fall. Almer escaped with a severe shaking, but was rendered insensible by the shock of the fall. Upon coming to himself, he found that both his companions were beyond help; and as soon as there was sufficient light, he struggled down to Courmayeur with the intelligence of the accident. The dead bodies were recovered the same evening, and brought back the next day to Courmayeur.

Of all the accidents which have happened on Mont Blanc, this was perhaps the one most deserving the term. Mr Marshall and his guides

were first-rate mountaineers, and it was scarcely from any fault of their own that the catastrophe occurred. From a sketch of the spot taken by M. Loppé the artist a few days after the occurrence, the crevasse looks curiously narrow, and if the party had only been standing hut a few paces to right or left, they would have been in perfect safety. Moreover, the scene of the catastrophe was not five minutes' walk from the moraine.

Thus Mont Blanc is responsible for the loss of no fewer than twenty-four lives; but it is when we compare him with other mountains that we realise how much more fatal he has been than any of his fellows. The following table, compiled from the *Alpine Journal*, will best bring home this fact:

	Accidents.	Lives lost.
Mont Blanc.....	7	24
Matterhorn.....	3	6
Lyskamm.....	2	6
Monte Rosa.....	2	4
Monte Cevedale.....	1	4
Dent Blanche.....	1	3
Hant de Crin.....	1	3
Tiella.....	1	2
Jungfrau.....	1	2
Wetterhorn.....	1	2
Aiguille Blanche.....	1	2

Single lives have been lost upon each of the following mountains: Riffelhorn, Gross Venediger, Schreckhorn, Piz Tschierwa, Diablerets, Blumli Alp, Piz Bernina, Grandes Jorasses, Meije.

Of accidents which may fairly come under the head of Alpine accidents, such as accidents upon glaciers and subsidiary peaks, there appear to have been thirty-five—making a total loss since 1850, when climbing became a recognised form of amusement, of ninety-eight lives, or, inclusive of Dr Hamel's accident, one hundred and one. When we come to consider that Mont Blanc is responsible for nearly one-fourth of the whole, we may well question whether the depreciation of the mountain is quite justified. Is it not rather a case of underrating the enemy?

No reasonable person can deny that there is at times danger on Mont Blanc, and when we consider from what a variety of causes it may arise—from weather, from the state of the snow, from the unfitness of many of those who attempt the ascent, and last, but not least, from the guide system of Chamouni—we feel inclined to wonder not, indeed, that the loss of life has been great, but rather that the death-roll is not much greater.

IN ALL SHADES.

CHAPTER XL.

EVEN as Delgado stood there still on the steps of the piazza at Orange Grove, waving his blood-stained cutlass fiercely about his head, and setting his foot contemptuously on Mr Dupuy's prostrate and bleeding body, Harry Noel tore up the path that led from Dick Castello's house at Savannah Garden, and halted suddenly in blank amazement in front of the doorway—Harry Noel, in evening dress, hatless and spurred; just as he had risen in horror from his dinner, and riding his new mare without even a saddle, in his hot haste to see the cause of

the unexpected tumult at the Dupuy's estate. The fierce red glare of the burning cane-houses had roused him unawares at Savannah Garden in the midst of his coffee; and the cries of the negroes and the sound of pistol-shots had cast him into a frantic fever of anxiety for Nora's safety. 'The niggers have risen, by Jove!' Dick Castello cried aloud, as the flames rose higher and higher above the blazing cane-houses. 'They must be attacking old Dupuy; and if once their blood's up, you may depend upon it, Noel, they won't leave him until they've fairly murdered him.'

Harry Noel didn't wait a moment to hear any further conjectures of his host's on the subject, but darting round to the stables bareheaded, clapped a bit forthwith into his mare's mouth, jumped on her back just as she stood, in a perfect frenzy of fear and excitement, and tore along the narrow winding road that led by tortuous stretches to Orange Grove as fast as his frightened horse's legs could possibly carry him.

As he leaped eagerly from his mount to the ground in the midst of all that hideous din and uproar and mingled confusion, Delgado was just calling on his fellow-blacks to follow him boldly into the bouse and to 'kill de missy;' and the Orange Grove negroes, cowed and terrified now that their master had fallen bodily before them, were beginning to drop back, trembling, into the rooms behind, and allow the frantic and triumphant rioters to have their own way unmolested. In a moment, Harry took in the full terror of the scene—saw Mr Dupuy's body lying, a mass of hacked and bleeding wounds, upon the wooden floor of the front piazza; saw the infuriated negroes pressing on eagerly with their cutlasses lifted aloft, now fairly drunk with the first taste of buckra blood; and Delgado in front of them all, leaping wildly, and gesticulating in frantic rage with arms and hands and fingers, as he drove back the terrified servants through the heavy old mahogany doorway of the great drawing-room into the room that opened out behind toward Nora's own little sacred boudoir.

Harry had no weapon of any sort with him except the frail riding-whip he carried in his hand; but without waiting for a second, without thinking for one instant of the surrounding danger, he rushed up the piazza steps, pushed the astonished rioters to right and left with his powerful arms, jumped over the senseless planter's prostrate body, swept past Delgado into the narrow doorway, and there stood confronting the savage ringleader boldly, his little riding-whip raised high above his proud head with a fierce and threatening angry gesture. 'Stop there!' he cried, in a voice of stern command, that even in that supreme moment of passion and triumph had its full effect upon the enraged negroes. 'Stop there, you mean-spirited villains and murderers! Not a step further—not a step further, I tell you! Cowards, cowards, every one of you, to kill a poor old man like that upon his own staircase, and to threaten a helpless innocent lady.'

As he spoke, he laid his hand heavily upon Louis Delgado's bony shoulder, and pushed the

old negro steadily backward, out of the doorway and through the piazza, to the front steps, where Mr Dupuy's body was still lying untended and bleeding profusely. 'Stand back, Delgado!' he cried out fiercely and authoritatively. 'Stand back this minute, and put down your cutlass! If you want to fight the whites, you cowardly scoundrels you, why don't you fight the men like yourselves, openly and straightforward, instead of coming by night, without note or warning, burning and hacking and killing and destroying, and waging war against defenceless old men and women and children?'

The negroe fell back a little grudgingly, as he spoke, and answered him only by the loud and deep guttural cry—an inarticulate, horribly inhuman gurgle—which is their sole possible form of speech in the very paroxysm of African passion. Louis Delgado bled his cutlass half doubtfully in his uplifted hand: he had tasted blood once now; he had laid himself open to the fierce vengeance of the English law; he was sorely tempted in the whirlwind of the moment to cut down Harry Noel too, as he had cut down the white-headed old planter the minute before. But the innate respect of the essentially fighting negro for a resolute opponent held him back deliberating for a moment; and he drew down his cutlass as quickly as he had raised it, divided in mind whether to strike or to permit a parley.

Noel seized the occasion with intuitive strategy. 'Here you, my friends,' he cried boldly, turning round towards the cowering Orange Grove servants—'is this the way you defend your master? Pick him up, some of you—pick him up this minute, I tell you, and lay him out decently on the sofa over yonder.—There, there; don't be afraid. Not one of these confounded rogues and cowards dares to touch you or come one pace nearer you as long as you're doing it. If he does! cutlass or no cutlass, I'll break this riding-whip to pieces, I tell you, across his black head as soon as look at him.' And he brandished the whip angrily in front of him, towards the mad and howling group of angry rioters, held at bay for the moment on the piazza steps by that solitary, undismayed, young Englishman with his one frail and ridiculous weapon.

The rioters howled all the louder at his words, and leaped and grinned and chattered and gesticulated like wild beasts behind an iron railing; but not one of them ventured to be the first in aiming a blow with his deadly implement at Harry Noel. They only yelled more incomprehensibly in their deep gutturals, and made hideous wild grimaces, and waved their cutlasses frantically around them with horrible inarticulate negro imprecations.

But Harry stood there firm and unyielding, facing the maddened crowd with his imperious manner, and overawing them in spite of themselves with that strange power of a superior race over the inferior in such critical moments of intense passion.

The Orange Grove servants, having fresh courage put into their failing breasts once more by the inspiring presence of a white man at their sides, and being true at heart to their poor master, as negro bouse-servants always are and

always have been in the worst extremities, took advantage of the momentary lull in the storm to do as Harry told them, and lift Mr Dupuy's body up from the ground, laying it carefully on the piazza sofa. 'That's better,' Harry said, as they finished their task.—'Now, we must go on and drive away these murderous rascals. If we don't drive them away, my good friends, they'll kill Miss Nora—they'll kill Miss Nora. Would you have it said of you that you let a parcel of murderous plantation rioters kill your own dead master's daughter right before your very faces?'

As he spoke, he saw a pale face, pale, not with fear, but with terrible anger, standing mutely and immovably beside him; and next moment he heard Nora Dupuy's voice crying out deeply, in the very echo of his own angry words: 'Cowards, cowards!'

At the sight of the hated Dupuy features, the frenzied plantation hands seemed to work themselves up into a fresh access of ungovernable fury. With indescribable writhings and mouthings and grimaces, their hatred and vengeance found articulate voice for a moment at least, and they cried aloud like one man: 'Kill her—kill her! Kill de missy! Kill her—kill her!'

'Give me a pistol,' Harry Noel exclaimed wildly to the friendly negroes close behind his back: 'a gun—a knife—a cutlass—anything!'

'We got nuffin, sah,' Uncle 'Zekiel answered, blankly and whiningly, now helpless as a child before the sudden inundation of armed rioters, for without his master he could do nothing.

Harry looked around him desperately for a moment, then, advancing a step with hasty premeditation, he wrenched a cutlass suddenly by an unexpected snatch from one of the foremost batch of rioters, and stepped back with it once more unhurt, as if by miracle, into the narrow pass of the mahogany doorway.

'Stand away, Miss Dupuy!' he cried to her earnestly. 'If you value your life, stand back, I beg of you. This is no place for you to-night. Run, run! If you don't escape, there'll be more murder done presently.'

'I shall not go,' Nora answered, clenching her fist hard and knitting her brow sternly, 'as long as one of these abominable wretches dares to stop without permission upon my father's piazza.'

'Then stand away, you there!' Harry shouted aloud to the surging mob; 'stand away this moment, every one of you! Whoever steps one single step nearer this lady behind me, that step shall be his last.'

Delgado stood still and hesitated once more, with strange irresolution—he didn't like to hit the brown man—but Isaac Pourtales, lifting his cutlass wildly above his head, took a step in front and brought it down with a fierce swish towards Harry's skull, in spite of kinship. Harry parried it dexterously with his own cutlass, like a man who has learned what fencing means; and then, rushing, mad with rage, at the astonished Isaac before he knew what to look for, brought down a heavy blow upon his right shoulder, that disabled his opponent forthwith, and made him drop at once his useless weapon idly by his side. 'Take that, you nigger dog!' Harry hissed out fiercely through his close-set teeth; 'and if any other confounded nigger

among you all dares to take a single step nearer in the same direction, he'll get as much and more, too, than this insolent fellow here has got for his trouble.'

The contemptuous phrase once more roused all the negroes' anger. 'Who you call nigger, den?' they cried out fiercely, leaping in a body like wild beasts upon him. 'Kill him—kill him! Him don't fit to lib. Kill him—kill him, dis minute—kill him!'

But Delgado, some strange element of compassion for the remote blood of his own race still rising, up instinctively and mysteriously within him, held back the two or three foremost among the pressing mass with his sinewy arm. 'No, no, me fren's,' he shouted angrily, 'don't kill him, don't kill him. Tiger no eat tiger, ole-time folk say; tiger no eat tiger. Him is nigger himself. Him is Isaac Pourtales' own cousin.—Don't kill him. His mudder don't nobody, I tell you, me fren's, but coloured gal, de same as yours is—coloured gal from ole Barbadoes. I sayin' to you, me fren's, ole-time folk has true proverb, tiger no eat tiger.'

The sea of angry black faces swelled up and down wildly and dubiously for a moment, and then, with the sudden fiftful changefulness of negro emotion, two or three voices, the women's especially, called aloud, with sobs and shrieks: 'Don't kill him!—don't kill him! Him me brudder—him me brudder. Don't kill him! Halclujah!'

Harry looked at them savagely, with knit brows and firm-set teeth, his cutlass poised ready to strike in one hand, and his whole attitude that of a forlorn-hope at bay against overwhelming and irresistible numbers.

'You black devils!' he cried out fiercely, flinging the words in their faces, as it were, with a concentrated power of insult and hatred, 'I won't owe my life to that shameful plea. Perhaps I may have a drop or two of your black blood flowing somewhere in my veins, and perhaps I mayn't; but whether I have or whether I haven't, I wouldn't for dear life itself acknowledge kinship with such a pack of cowardly vagabonds and murderers as you, who would hack an old man brutally to death like that, before his own daughter's face, upon his own staircase.'

'Mr Noel,' Nora echoed, in a clear defiant tone, nothing trembling, from close behind him, 'that was well said—that was bravely spoken! Let them come on and kill us if they will, tho' wretches. We're not afraid of them, we're not afraid of them.'

'Miss Dupuy,' Harry cried earnestly, looking back towards her with a face of eager entreaty, 'save yourself! for God's sake, save yourself. There's still time even now to escape—by the garden-gate—to Hawthorn's—while these wretches here are busy murdering me.'

At the word, Louis Delgado sprang forward once more, cutlass in hand, no longer undecided, and with one blow on the top of the head felled Harry Noel heavily to the ground.

Nora shrieked, and fell fainting to the ground. 'Him don't dead yet,' Delgado yelled aloud in devilish exultation, lifting his cutlass again with savage persistence. 'Hack him to pieces, dar—hack him to pieces! Him don't dead yet,

I tellin' you, me fren's. Hack him to pieces! An' when him dead, we gwine to carry him an' de missy an' Massa Dupuy out behind dar, an' burn dem all in a pile togedder on de hot ashes ob de smokin' cane-house!

COUNTRY JOTTINGS.

THE British Islands were formerly covered with vast forests. Robber-bands at one time infested the woods, of whom Robin Hood of Sherwood Forest is the most noted. A continually increasing population and the advancement of science have changed the aspect; these places have now become the abodes of peaceful, civilised, and friendly men; the desert and impenetrable forest are changed into marts of industry, cultivated fields, rich gardens, and magnificent cities. The towns and cities of the Britons were generally built in valleys upon the margin of a stream or river, for the convenience of water and security from winds. Surrounded by impervious woods, and secured by a rampart and fosse, they were sufficiently strong to resist the ordinary attacks of their enemies. The Roman soldiers were as much accustomed to the use of the plough as the shield, and were as industrious in peace as they were brave in war. When they had fixed their camps, they availed themselves of the advantages the surrounding country presented, in order to secure to themselves the necessary supplies. Woods were cut down, the ground cleared and ploughed up; and roads were constructed from station to station, to facilitate the conveyance of goods, and collect their forces together with more ease and expedition on any sudden emergency. The Roman custom of grazing in Italy was adopted in the remotest parts of their widely extended empire. The dry ground of the hills and the moist meadows of the vale were successively the pasture of their flocks and herds. During the summer, they confined them to the marshes and low grounds; and on the approach of winter they drove them up to the hills. Our Anglo-Saxon forefathers in the forests of oak and beech reared large numbers of sheep and swine, and in the rich pastures and open downs of the south and west.

Uncivilised man, impelled rather by his wants than allured by pleasure, ardently pursues the beasts of the forest. Hunting may be considered as his necessary employment, and the game caught by his dexterity and cunning, as being the chief part of his subsistence. This employment, tedious as it is, yields, however, but a precarious and uncertain support; and when man has been taught to supply his wants by the cultivation of the ground, if it be not wholly relinquished, it will only be pursued as an amusement or as a healthful exercise. The ancient Britons lived on milk and the produce of the chase. In the present day, the Hottentot and Bushman partly live on the larvae of insects and the refuse of animals killed by the colonists. In Australia proper, some natives eat reptiles, and even insects and vermin. The Oceanic negroes have no fixed habitation, but they live in the hollows of trees and rocks. Many of the inhabitants of the Marquesas, Fiji, and other islands, are cannibals. Among a tribe in Sumatra, criminals condemned are eaten alive, each one, according to

his rank, taking that portion of flesh from the living victim he prefers, and devouring it on the spot either raw or cooked. Agriculture amongst these tribes is in a very backward state, and hunting is one of their principal means of subsistence.

Ancient chronicles state that King Edgar attempted to extirpate the wolves in England, by commencing the punishments for certain offences into the acceptance of a certain number of wolves' tongues from each criminal; and in Wales, by converting the tax of gold and silver into an annual tribute of three hundred wolves' heads. In subsequent times, their destruction was promoted by certain rewards, and some lands were held on condition of destroying the wolves which infested the parts of the kingdom in which they were situated. In 1281 these animals troubled several of the English counties, but after that period our records make no mention of them. The last wolf known in Scotland was killed in 1689; and in Ireland, one was killed in 1701. Very fearful accounts are on record of the ravages committed by wolves when in hard weather they associate in immense flocks. So lately as 1760, such terror is said to have been excited in France by ravages of wolves that public prayers were offered for their destruction. Since India became so much the country of Europeans, the race of tigers has been much thinned, and ere long it is probable that they will be driven to the most remote and impenetrable districts.

The wolf in these islands was hunted by an animal known under various appellations, as the Irish wolf-dog, the Irish greyhound, the Highland deerhound, and the Scotch greyhound. There appears to be no doubt that all the dogs thus denominated were essentially of the same breed. Its original home is supposed to have been Ireland, whence, during the proud days of ancient Rome, it was frequently conveyed in iron cages to assist in the sports of the city on the Tiber. Buffon observes: 'The Irish greybonds are of a very ancient race, and still exist (though their number is small) in their original climate; they were called by the ancients, dogs of Epirus and Albanian dogs.' Holished, in his *Description of Ireland and the Irish*, written in 1586, says: 'They are not without wolves and greybonds to hunt them, bigger of bone and limb than a colt.' In Anglo-Saxon times, a nobleman never went out unaccompanied by some of these dogs and his hawk; and so highly were they esteemed, that by the forest laws of Canute it was ordered that no person under the rank of a gentleman should keep one.

Until after the Norman Conquest, the chase was always, even in England, pursued on foot; the nobles of the Conqueror's train introduced the custom of hunting on horseback. As cultivation increased, and the most formidable objects of chase, the wolves, decreased in England, the breed degenerated in size and strength; whilst the quality now more desiderated, speed, was, on the other hand, still more strongly developed. The result is the present race of greyhounds. In Ireland, Scotland, and Wales, the rugged character of the country kept up for a much longer time the ancient deer-hunts in all their essential features. Boar-hunting, ages ago, was

prescribed in England. Fitzstephen, in his description of England, written in the reign of Henry II., in the latter part of the twelfth century, states that the forest by which London was then surrounded was frequented by boars as well as various other wild animals. In Scotland, a tract of country now forming one of the extremities of the county of Fife, was anciently called Muckcross, which in Celtic signifies the Boar-promontory. The tradition is that it was a famous haunt of boars. A district forming a portion of the same country, designated by the name of the Boar Hills, lies in the vicinity of St Andrews, in the cathedral church of which city it is said that there were to be seen before the Reformation, attached by a chain to the high-altar, two boars' tusks of the extraordinary length of sixteen inches each, the memorials of an enormous specimen which had been slaughtered by the inhabitants after having long infested the neighbourhood. The wild-boar was undoubtedly an inhabitant of these islands, as mention is made of it in the laws of Hoel-Dla, a celebrated Welsh legislator, who permitted his grand-huntsman to chase that animal from the middle of November to the beginning of December. William the Conqueror punished with loss of life such as were guilty of killing the wild-boar.

Some remarkable occurrences have taken place with regard to the tame kinds. A gamekeeper actually educated a black sow to find game. Sint, the name he gave her, was rendered as staunch as any pointer. This pig-pointer was sold by auction for a very large sum of money. A gentleman had a sow which was taught to hunt, quarter the ground, and to back the other pointers. As a reward for her labours, the keeper carried bread in his pocket. In the island of Minorca, hogs are converted into beasts of draught; a cow, a sow, and two young horses have been seen yoked together, and of the four, the cow drew the least.

Nothing can more strongly establish the passionate devotion of the Normans to the sports of the field than the conduct of the Conqueror who laid waste the county of Hampshire and made it a forest for wild feasts. The nobles, like their leader, within their domains inclosed extensive districts to preserve the *feræ naturæ*, to afford them the pleasures of the chase. Parks have been defined forests inclosed, and were called *hæve dominicales*. This word *hæve* appears in the composition of a variety of English local names under the dialectical difference of *hey*, *hay*, *how*, *haigh*. It is the Saxon *hæg*, and means a hedge. To our royal and baronial castles usually belonged two parks—one inclosed with a wall for fallow-deer, and the other for red-deer, fenced around with a hedge. Free warren was a franchise granted for preservation or custody of beasts and fowls of warren, which, being *feræ naturæ*, every one had a right to kill as he could; but upon the introduction of the Forest Law at the Norman Conquest, these animals being looked upon as royal game and the sole property of our savage monarchs, this franchise of free warren was invented to protect them, by giving the grantee a sole and exclusive power of killing such game as far as his warren extended, on condition of his preventing other

persons. Nanwood informs us that the hare, the coney, the pheasant, and the partridge were beasts and fowls of warren and no other. Sir Edward Coke mentions as beasts and fowls of warren, roes, rails, and quails, woodcocks, mallards, and herons. Free warren gave to the lord of a manor an exclusive right to hunt and kill the game therein.

An attempt was made some years ago to introduce the reindeer upon an extensive scale into the colder parts of England and Scotland. Those that were turned out upon the Pentland Hills, near Edinburgh—a situation which was considered peculiarly favourable—all died. A few appeared to do well in a park near Dublin, but then died. The Duke of Athole had previously placed a herd of reindeer in the mountains of his estate; but the experiment failed. Several fine species of the wapiti, an American deer, were turned into Windsor park some years ago: none of them lived more than a year. The migratory disposition of those animals is perhaps the reason of their not thriving in any inclosed country.

The timber of our woods in the reign of Queen Elizabeth was plentiful, nor did the navy, the pride of Britain, consume one-thousandth part of the timber which was found requisite. Though the country is now shorn of its stately oaks, other countries are ready to cut down their forests and exchange them for British industry. Ireland was formerly called the Island of Woods, and the trunks of large trees are still found in the bogs. A vast quantity of timber is exported from Germany. In some parts of Austria, peat is used as fuel, wood being scarce; yet the mountains of Transylvania and the neighbouring south countries abound in extensive forests. Such is the abundance of oak, that above two hundred thousand bushels of oak-apples are exported annually. The forests of Greece are considerable. The quantity of timber sent from Norway and Sweden is very great. The resources of Russia lie in its immense forests, its mines, and the fertility of its soil. Some of the gum-trees of Tasmania are three hundred and fifty feet high. The baobab of Africa is said to live five thousand years, and one trunk has measured one hundred and four feet in circumference. So thick and uninterrupted are the forests which cover the plains of South America between the Orinoco and the Amazon, that were it not for intervening rivers, the monkeys, almost the only inhabitants, might pass along the tops of the trees for several hundred miles without touching the earth. Sir Francis Head says that the backwoods of North America are being cleared in the following way. The mosquitoes torment the bison and other wild animals to such an intolerable degree that they run with eagerness into any smoke they can reach, as their little tormentors will not follow them there. The Indians, then, instead of hunting for game, set fire to the forests; this brings the animals about them, and they are easily shot. This is favourable to the white agriculturist, but destructive to the poor Indian, at least as long as he continues a mere hunter.

In British North America, the felling and removing of timber for exportation is an important employment. This is known as the lumber-trade, and those engaged in it are called lumberers. In Danish America, the inhabitants

are supplied with wood for fuel by the drift-timber brought to the coasts by the currents. Brazil may be regarded as a vast forest—the forests are so extensive that they can hardly be penetrated even with the help of fire and the hatchet. In these vast solitudes, sometimes a death-like silence reigns; at other times are heard the howling of herds of monkeys, the screams of parrots and toucans, with the huzzing of the bee-like humming-bird, which the Brazilians prettily call the 'Kiss the Flower.' The New Holland lily grows to the height of twenty-four feet; and in the Argentine Republic there are immense numbers of thistles, ten or twelve feet high, which form an impenetrable barrier, whilst they last, to the attacks of the Indians.

The wild animals of England are now few in number. At Chillingworth Park, in Northumberland, there are some wild oxen. Had the fox not been preserved for the chase, it would long ago have been extinct. Dogs have a strong repugnance to the wolf, but delight in the chase of the fox. In cold countries, foxes are of various colours. Red foxes are so abundant in the wooded districts of the fur countries, that many thousand skins are annually exported from America to Britain. The fur of the black fox is highly valued. While the writer was engaged upon this article, the following circumstance came under his notice. On the Alveston Hill estate, near Stratford-on-Avon, a litter of eleven foxes, apparently about six weeks old, all tame and docile, have taken possession of a rabbit-hole in a bank at the foot of a clump of trees. The young cubs, notwithstanding the presence of numerous people attracted to the spot by the novel sight, leave their hole and drink occasionally out of a trough containing milk which had been placed there for their use. The animals are as tame as puppies, and the visitors easily induce them to come forth, by whistling softly and calling them. They are content to be picked up and caressed, and they play about in the most amusing manner. An artist has been to the spot and photographed the whole group. It is thought that the dog-fox has been killed, and that the vixen has carried her cubs to the place mentioned. In corroboration of this, it may be stated that when first discovered, only four or five cubs were to be seen, and they have gradually increased until the present number has been reached.

The wild-cat finds its retreat among the mountains of Scotland and of the northern counties of England and of Wales and Ireland, the larger woods being its places of concealment. It has been called the 'British Tiger.' One was killed in Cumberland which measured five feet from the nose to the end of the tail. When Christopher Columbus discovered America, a hunter brought him one which he had found in the woods. The hedgehog has been said to be proof against poison. A German physician who wished to dissect one, gave it prussic acid; but it took no effect, neither did arsenic, opium, nor corrosives sublimata. It has been found to eat a hundred cantharides without injury. Plutarch mentions the case of a man who discovered that a hedgehog generally has its burrow open at various points, and warned by an instinct of atmospheric change, stopped up the opening next the quarter whence the wind would blow, and thus could

predict to a certainty to which quarter the wind would shift. Moles show changes of weather. The temperature or dryness of the air governs that underground worker in its motions as to the depth at which it lives or works; though this unquestionably is partly due, no doubt, to its want of food or inability to bear cold or thirst. The weasel has been known to become domesticated. The method adopted to obtain this end is to stroke them gently over the back, and to threaten or heat them when they attempt to bite. It has been found that when their teeth have been rubbed with garlic, all inclination to bite has been removed. Their bite is generally fatal: a hare or rabbit once severely bitten never recovers. Buffon gives the case of a weasel being found with three young ones in the carcass of a wolf that was grown putrid, and that had been hung up by the hind-legs as a terror to others. In this strange and horrid retreat, the weasel had retired to bring forth her young; she had furnished the cavity with hay, grass, and leaves; and the young ones were just brought forth when they were discovered by a peasant passing that way.

The stoat of this continent is a very precious article of commerce. In Britain, their skin is of little value. In July 1827, a gentleman of Cathcart, near Glasgow, having shot and wounded a stoat, observed that it escaped into the hole of an old stone wall. He was led to make an examination of the place, when he found a couple of leverets immolated. The place also contained two young partridges entire, and a pheasant's egg unbroken. Besides these were two other leverets in a state of putrefaction; and at the extremity of the retreat lay the dead stoat. Naturalists state that stoats seldom eat their plunder until putrefaction sets in; and this fact would seem to bear out the impression. The polecat is very destructive to game. During a severe storm, one of these animals was traced in the snow from the side of a rivulet to a hole at some distance from it. As it was observed to have made frequent trips, and as other marks were to be seen in the snow which could not easily be accounted for, it was thought a matter worthy of greater attention. Its hole was accordingly examined, the polecat taken; and eleven eels were discovered to be the fruit of its nocturnal excursions. The marks in the snow were found to have been made by the motion of the eels in the creature's mouth.

It is a curious circumstance that many of these oaks which are called spontaneous are planted by the squirrel. This little animal has performed an essential service to the British navy. A gentleman walking one day in the woods belonging to the Duke of Beaufort, in the county of Monmouth, his attention was diverted by a squirrel, which sat very composedly upon the ground. He stopped to perceive its motions. In a few minutes the animal darted to the top of a tree beneath which he had been sitting; in an instant it was down with an acorn in its mouth, and after digging a small hole, it deposited the acorn; then covering it, it darted up the tree again. In a moment it was down again with another, which it buried in the same manner. This it continued to do as long as the gentleman watched it. The industry of this animal is

directed to the purpose of securing itself against want in the winter; and it is probable that its memory is not sufficiently retentive to enable it to remember the spot in which it deposited every acorn; the industrious little fellow no doubt loses a few every year. These few spring up, and are destined to supply the place of the parent tree.

Asses, like horses, are found in a wild state, but in greater abundance. This animal is found wild in many islands of the Archipelago, and in the deserts of Libya and Numidia. They live in herds, each having a chief, and are extremely timid. The ass, so common now in England, was entirely lost in the reign of Queen Elizabeth. Holinshed says that our land yielded no asses. In early times the ass was held in high repute, for he was ridden both by the poor and the rich, and is frequently mentioned in the Scriptures. In the principal streets of Cairo, asses stand bridled and saddled for hire, and answer the same purpose as cabs in London. In Egypt and Arabia, asses are frequently seen of great size and elegance. Their step is light and sure, and their pace brisk and easy. They are not only in common use for riding in Egypt, but the Mohammedan merchants and ladies of the highest rank use them: In England, the ass is regarded as a stupid and contemptible animal. The Spaniards, on the contrary, bestow much pains upon him in endeavouring to improve the breed.

A FRIEND OF THE FAMILY.

CHAPTER II.—WORSE AND WORSE.

THE Major fervently wished that the ground would open and swallow him. Here was a third lady to pacify and to convince that a mistake had been made. He could see that she was in a more exasperated state even than Mrs Joseph, and likely to be as blind as Mrs John. The complication was becoming utterly bewildering, and he felt that his brain would not endure much more of it. How could such simple letters as his—made studiously cautious in their statements—evoke such wildly erroneous interpretations? He would rather have faced a whole battalion of malicious Sikhs or infuriated Afghans than have had to go through the inevitable interview with this beautiful girl.

As soon as she reached the Major's side, she clutched his arm as if it were that of her natural protector, and turned sharply upon Maynard: 'Now, sir, will you leave me alone? Major Dawkins will conduct me to my aunt, and will, if necessary, protect me from your importunities.'

'But Nelly, I only want to know what is my fault? How have I given you cause for treating me in this way?' pleaded Maynard. 'I am positive that none can exist except in your own imagination. I am sure the Major will tell you that it is not fair to condemn a man without hearing his defence—without even telling him what he is accused of.'

'If you are a gentleman, you will defer further discussion of the subject until you see my aunt, Mrs Joseph Elliott.'

Had they been alone, the lover would doubtless

have acted differently; but to have such words addressed to him in the presence of another man left no alternative. He bowed and retired, hurt and angered by this injustice of his betrothed. Whatever her reason for this outburst might be, he was resolved that it should be promptly explained. He was a straightforward young fellow, and not one to rest for a moment in doubt as to the meaning of her conduct.

The brief scene had closed before the Major could find his voice. 'Call him back,' he said agitatedly—'call him back before it is too late.'

'I certainly will not,' replied the lady with a movement of the head as if about to look behind, suggesting that she half-hoped to see him still following. But he was not.

'Then I must. I cannot allow you to distress yourself and a fine fellow like that in consequence of my blunder.'

She stopped and faced him with an expression of supercilious wonder. By this little movement she could look without appearing to turn for the purpose of looking whether or not Maynard had really obeyed her. 'I do not understand you, Major Dawkins,' she said with a faint note of chagrin in her musical voice—for Maynard really was not in sight.

'Of course you cannot. How could you? The letter you have got was not meant for you. I wrote it to another lady, and I beg you to give it back to me, so that no further mischief may come of it.'

'Another lady! Then I am not the only one he thinks of!' (She was quoting from the letter.)—'Oh, Major Dawkins, this is too much. Please, let me go to the house, and do not say another word about it until I have had time to recover and to think.'

The Major stood aghast; he had put his foot in it again. 'But you are taking me up in quite a wrong way. Certainly you are the only one Maynard thinks of; but he is not the man referred to in the letter. Do give it back to me; and when you are calmer, everything will be explained.'

He pleaded very earnestly; but his object was defeated by the ingenuity on which he had congratulated himself. He had mentioned no names in any of the epistles. The mind of each lady on reading the one she received naturally fastened upon the man in whom she was most interested, and the Major's excited attempts at explanation failed to make the error clear to them. Their unreasonableness was painful to him; and if he had been less anxious about remedying his error, he would have laughed at it.

'For whom, then, was the letter written?' asked Nellie, her indignation now turning against the Major, as she reflected how cruel and how foolish Stanley Maynard would think her if she had accused him of falsehood on no other ground than that she had received a misdirected letter from a friend. 'I must insist upon an answer.'

'You really must not insist upon my telling you. I accept all the blame; and it would be another wicked blunder on my part to give you my friend's name.'

'In that case, I must decline to return the letter until we are in the presence of my aunt and Mr Maynard.—Meanwhile, I need not trouble you to escort me to the house.' Nellie walked

proudly away; but the poor girl was ready to cry with vexation and with regret for the hastiness of temper which had characterised her conduct towards Stanley Maynard. In the moment of repentance, however, came the remembrance of the words which had distracted her. 'I want to save you' (wrote the Major) 'from a grave misunderstanding.' ('Very kind indeed,' she interjected.) 'He who is, I know, dearest to you, thinks *only* of you. Consider his impulsive nature, and pardon his temporary aberration.' ('What could that mean, if not that he had been making love to somebody else?' she asked bitterly. Had she not herself seen how, barefacedly he flirted with Mrs John, until she had a tiff with him on the subject? If he could dare so much before her eyes, what might he not do when uncheck'd by her presence?) 'Be merciful to him,' the note proceeded, 'as hitherto, and you will have your reward. I mean to take the first available opportunity of talking to him after my arrival at Todhurst, and am confident that he will be promptly brought to reason.'

Was not that enough to rouse the spirit of any girl who had proper pride, which means self-respect? Nellie thought in her anger that it was more than enough. No doubt the Major had talked to him, and having brought him to reason, was now anxious to screen him by telling her that it was all a mistake—that the letter had been intended for somebody else! But she was frightened by this conclusion. Surely the Major could not tell a deliberate falsehood! He might not have meant to do so, and yet do it in the excitement of the moment, in order to soothe her. That must be the way of it; and what an indignity that it should be necessary for a friend to plead for her with the man to whom she had promised her hand!

Her thoughts alternated between the hope that it was all a mistake and the fear that it was not. So she went to her room, cried, had a headache, and excused herself from joining the family at luncheon.

The Major was out of breath and out of patience as he gazed helplessly after the retreating form of Nellie Carroll. Nobody would listen to him; everybody seemed determined to believe that he had entered into a diabolic conspiracy to wreck the happiness of the house of Elliott. What on earth could there be in any of his letters to cause such a commotion, even when they had got into the wrong hands? He had assured every one that there was only a misunderstanding, and he had promised all round to set it right. But they would not give him a chance. He had a good mind to order Hollis to pack up for the next train to London. That, however, would be cowardly, and he was not a coward. He would see the thing out to the bitter end. He lifted his head with an air of resolution, and the bitter end he saw at that moment was represented by the wealthy spinster, Miss Euphemia Pantom. She was standing at a little distance, glaring at him severely through her gold-rimmed *pince-nez*. The Major had reason to believe that he had found favour in her eyes, and he thought with intense relief: 'Well, here is somebody at last who will give me a word of sympathy, and talk sensibly with me.'

She, too, had reason to believe that she had found favour in the Major's eyes, and was pleased accordingly. But on the present occasion, as he tripped hopefully towards her (he tripped somewhat less gracefully than usual, on account of his recent excessive exercise), she made no responsive movement; the *pince-nez* was not lowered, and the severe expression remained. She had been observing him pleading with all the ardour of a lover to Miss Carroll; and she had no doubt whatever of the meaning of his evidently eager speech: he was in love with the minx, and he had been only pretending to care for Miss Euphemia! No lady can submit to be trifled with in matters of affection, and least of all ladies who have arrived at what may be called the 'undiscovered decade' in feminine history. She had passed into that realm of mystery, and was indeed one of its oldest inhabitants; and when nature would have lifted her out of it into the peaceful land of resigned old-maidenism, she sought the aid of art in order to keep her place in the still hopeful region. She availed herself of the modern elixirs of youth, and flattered herself that she did so with complete success. She, at their first meeting, noted that the Major trafficked with the same beneficent powers. He on his side made a similar observation regarding her: Strange to say, this fact constituted a bond of sympathy between them; but Miss Euphemia believed that the Major was unaware of her secret, and he was satisfied that she had no suspicion of his; whilst each pitied the other for not being more expert in the use of dyes and cosmetics. Thus they became special friends, and found so much pleasure in each other's society, that a matrimonial climax seemed not improbable, the lady having a sufficient dowry to dispose satisfactorily of the important problem of ways and means.

'Thank goodness, you are here, Miss Pantom,' exclaimed the Major in the full confidence of her sympathy in his miserable position. 'I have got myself into a most abominable mess by an act of stupidity which, although reprehensible, is excusable.'

The lady answered not a word. She was nearly a head taller than he, and she continued to survey him through her glasses as if he had been some zoological specimen.

He had been hot enough before; he was chilled to the marrow now. He could scarcely believe his senses. Would she, too, desert him in this crisis?

'Miss Pantom,' he stammered, 'I hoped—that is, I believed that you would show me some consideration. I suppose Mrs Joseph has been speaking to you; but if you will only listen to a few words of explanation, you will understand me.'

'I think, Major Dawkins, I have to-day observed enough on the tennis-lawn and here, to enable me to understand you perfectly without Mrs Joseph Elliott's assistance or yours.' The words were icicles. She dropped her *pince-nez* and walked away.

The Major was speechless. He trembled or shivered with dismay. Lifting a hand to his brow, he felt the beads of cold perspiration on it, and at the same moment the gong sounded for luncheon. Good heavens! Horrible idea!

—the effect of all this excitement and perspiration must be to change the colour of his hair! And true enough it was beginning to show a marked shade of gray-green at the roots. He must get to his room to repair the damage before he appeared at the luncheon table. 'Desperate ills need desperate remedies.'

Luncheon at Todhurst was, except in the hunting season, like the family gathering of other days, when the mid-day meal was the chief one. There were hither the interchanges of the morning's experiences, pleasant intercourse with some of the elder members of the nursery, and a homely ease which was not always found at the late dinner, when formal company-manners had to be assumed, so far as they could be in the genial presence of Squire Elliott. All this was changed on the fatal day on which the Major's misdirected letters had been delivered. The Squire sat at one end of the table, evidently in an ill-humour; his spouse, Mrs Joseph, at the other end, doing her best not to show the wrath which was in her bosom. Mrs John was suppressing her natural gaiety and desire to make fun of the whole party, whilst she was pathetically earnest in her endeavours to soothe the perturbed spirit of her lord. The latter was irritable and gloomy, accepting her attentions most ungraciously. Stanley Maynard ate and looked as if he were savagely devouring an enemy. Miss Enphemia sat like a post, playing with her knife and fork rather than eating. Nellie was not present.

The Major was late in taking his place, and was flustered in consequence, even more than he might have been under the circumstances. He felt the gloom which pervaded the place, and he was made painfully conscious of the fact that he was the cause of it. He was generally regarded as an acquisition to any party, for he had a special knack of setting conversations 'going,' a more useful quality than that which constitutes a 'good talker.' The latter demands everybody's attention, and bores the greater part of his audience; the former enables everybody to speak, and thus produces the agreeable feeling of self-satisfaction in having personally contributed to the enjoyment of the hour.

With desperate heroism, he endeavoured to break the spell which tied the tongues of his companions. He told one of his best stories, the point of which had never failed to set the table in a roar of laughter. Lugubrious grimaces were the only response. He tried another anecdote, with the same result. He descended to the lowest depths of convivial intercourse; he propounded a conundrum, and the eldest of the girls immediately answered it with the addition of the galling commentary: 'I knew that long ago.' In his present condition of absolute helplessness, he wished to goodness the child would remember another conundrum, and give it for his benefit, if not for that of the company. Probably, she would have done so, had not the mother's eye been upon her, suggesting the austere maxim, 'Children should be seen, not heard.'

The Major took another tack. He put questions to his host about the moors, about the horses, about the hounds, and about the cause of *Tally-ho's* illness—any one of which topics would at another time have started the Squire

into a gallop of chat. He would have compared the seasons as affecting the moors for twenty years past; he would have detailed the pedigree and merits of every horse in his stables; he would have repeated endless anecdotes about the hounds; and as to the illness of *Tally-ho*, he would have gone into the most minute particulars as to its cause, his treatment, and the probable result.

But on this day all was in vain. The Major's suggestive queries were responded to by: 'Don't know,' 'Much the same as usual,' 'Hope for the best,' and 'I daresay the brute will come round.'

When they rose from the table, the Major thanked heaven that this trial was over. The Squire, with a curious mingling of awkwardness and suppressed ill-temper, utterly opposed to his habitually jovial manner, advanced to his unhappy guest: 'I want to see you in the library in about half an hour,' he said, and walked out of the room.

'That's a comfort,' thought the Major. 'I shall have a man with some common-sense to hear me.'

Meanwhile, he would have liked to speak a few words of consolation to Maynard; but that gentleman met his advances with somewhat repellent politeness.

'If you want to speak to me about the trouble you have made between Miss Carroll and me, you will have ample opportunity to do so when we meet in the library,' he said, and strolled out to the lawn to seek the soothing influence of a cigar.

Then the Major wished to discharge the duty he had so rashly undertaken, which was to bring the morbidly suspicious John Elliott to reason. He was only now realising the difficulty of the task; and he presently had a decisive indication that it was likely to be one he could not accomplish. He had barely uttered half-a-dozen words of his well-intentioned admonition which was to precede his explanation of 'the incident,' when John Elliott peevishly interrupted him: 'I have promised not to discuss this subject until we are in the library.'

So, he was to meet the three of them. So much the better; they were men, and they would give him a patient hearing. Still, he would have liked a little private talk with John Elliott before the meeting in the library, which was assuming the character of a sort of court-martial. There were things to say to him which could only be uttered when they were conversing confidentially. For instance, he could not say to him before others: 'You have been accusing Mrs John of behaviour unbecoming your wife; you have magnified the circumstance of her allowing young Maynard to kiss her under the mistletoe last Christmas, until you have come to believe that every time she says a friendly word to him or smiles on him, she is false to you. You have even gone so far as to think of employing a private detective to watch them. Now, my dear friend, do get all that confounded nonsense out of your head. Remember that she has known Maynard from his boyhood; and although she is not old enough to be his mother, she still looks on him as a boy, and he regards her as an elder sister. She is naturally frank, and naturally treats him with more frankness

than she does other men. You know that she long ago set her heart upon making a match between him and Nellie Carroll, both being suitable in every respect; and she has succeeded. What do you think will happen if your absurd fancies get wind? Why, there will be a general rupture—a split in the camp which may separate the young folk, and, possibly, you and Mrs John, who has been and is devoted to you.

There, that would have brought him to reason, if he had a scrap of sense left. But it could not be spoken in the presence of others. Very likely, suspicious John would ask him how he came to know all this, and the question would be troublesome—a thousand times more troublesome since all the letters had got into the wrong hands. The one for John Elliott had reached Mrs Joseph, instead of the simple intimation of the date of the Major's arrival; that for Nellie had been delivered to Mrs John, and Mrs John's to Nellie. It was awkward.

'As to the question,' the Major reflected: 'I got the information from Matt Willis, the brother of Mrs John; and he made me promise not to mix him up in the affair. He got the information from John Elliott himself, who complained to his brother-in-law about the way his wife was carrying on with Maynard. Matt had an unconquerable antipathy to family squabbles, and would not interfere; but thinking that something should be done to shut John up before serious harm came of his insane suspicions, he asked me, as the friend of the family, to put things right. Like a fool, I consented; and the blame of all the trouble falls on me! Am I to blame?—Stop a minute. By Jove!—it is John Elliott who is the author of the whole mischief, and I'll tell him so.'

Greatly consoled by the discovery that he was not the original culprit in causing what promised to be a serious breach in the relationships of valued friends, the Major was prepared to face the court-martial before which he was presently to stand. Ay, and he would have no nonsense about the affair. He would tell Squire Joseph bluntly that Mrs Joseph had taken possession of a letter which did not belong to her. He would tell Maynard to go and speak to Nellie, and assure her, as he had done, that she had misinterpreted the letter she had received, even if it had been intended for her; and he would tell John Elliott that he must either speak to him in private, or take the consequence of his speaking in the presence of the Squire and Stanley Maynard.

AN OLD TULIP GARDEN.

A QUIET, sunny nook in the hollow it is, this square old garden, with its gravelled walks and high stone walls; a sheltered retreat left peaceful here, under the overhanging woods, when the stream of the world's traffic turned off into another channel. The gray stone house, separated from this garden by a thick privet hedge and moss-grown court, is the last dwelling at this end of the quiet market-town, and, with its slate roof and substantial double story, is of a class greatly superior to its neighbours, whose warm red tiles are just visible over the walls. It stands where the old road to Edinburgh dipped to cross a little

stream, and, in the bygone driving days, the stage-coach, after rattling out of the town and down the steep road there, between the white, tile-roofed houses, when it crossed the bridge opposite the door, began to ascend through deep, embowering woods. But a more direct highway to the Scottish metropolis was opened many a year ago: just beyond the bridge, a wall was built across the road; and the gray house with its garden was left secluded in the sunny hollow. The rapid crescendo of the coach-guard's horn no longer wakens the echoes of the place, and the striking of the clock every hour in the town steeple is the only sound that reaches the spot from the outside world.

The hot sun beats on the garden here all day, from the hour in the morning when it gets above the grand old beeches of the wood, till it sets, away beyond the steeple of the town. But in the hottest hours it is always refreshing to look, over the weather-stained tiles of the long low toolhouse, at the mossy green of the hill that rises there, cool and shaded, under the trees. Now and then a bull, of the herd that feeds in the glades of the wood, comes down that shaded bank, whisking his tawny sides with an angry tail to keep off the pestering flies, and his deep hollow reverberates in the hollow. In the early morning, too, before the dew freshness has left the air, the sweet mellow pipe of the mavis and the fuller notes of the blackbird float across from these green depths, and ever and again throughout the day the clear whistle of some chaffinch comes from behind the leaves.

Standing here, among the deep hox edgings and gravel paths, it is not difficult to recall the place's glory of twenty years ago—the glory upon which these ancient plum-trees, blossoming yet against the sunny walls, looked down. To the eye of Thought, time and space obstruct no clouds, and in the atmosphere of Memory, the gardens of the Past bloom for us always. Years and years ago! It is the day of the fashion for Dutch bulbs, when fabulous prices were paid for an unusually 'fancy' bulb, and in this garden some of the finest of them are grown. The tulips are in flower, and the long narrow beds which, with scant space between, fill the entire middle of the garden, are ablaze with the glory of their bloom. Queenly flowers they are, and tall, each one with a gentle pedigree—for nothing common or unknown has entrance here—and crimson, white, and yellow, the velvet petals of some almost black, striped with rare and exquisite markings, they raise to the sun their large chaste chalices. The perfection of shape is there, as they rise from the midst of their green, lance-like leaves; no amorous breeze ever invades the spot to dishevel their array or filch their treasures; and the precious golden dust lies in the deep heart of each, untouched as yet save by the sunshine and the bee. When the noonday heat becomes too strong, awnings will be spread above the beds; for with the fierce glare, the petals would open out and the pollen fall before the delicate task of crossing had been done.

But see! Through the gate in the privet hedge there enters as fair a sight. Ladies in creamy flowered muslins and soft Indian silks, shading their eyes from the sun with tiny parasols, pink and white and green—grand dames of

the county, and grander from a distance; gentlemen in blue swallow-tailed coats and white pantaloons—gallants escorting their ladies, and connoisseurs to examine the flowers—all, conducted by the owner, book in hand, advance into the garden and move along the beds. For that owner, an old man with white hair, clear gray eyes, and the memory of their youthful red remaining in his cheeks, this is the gala time of the year. Next month, the beds of ranunculus will bloom, and pinks and carnations will follow; but the tulips are his most famous flowers, and, for the few days while they are in perfection, he leads about, with his old-world courtesy, replying to a question here, giving a name or a pedigree there, a constant succession of visitors. These are his hours of triumph. For eleven months he has gone about his beloved pursuit, mixing loams and leaf-moulds and earths, sorting, drying, and planting the bulbs, and tending their growth with his own hand—for to whose, else, could he trust the work?—and now his toil has blossomed, and its worth is acknowledged. Plants envied by peers, plants not to be bought, are there, and he looks into the heart of each tenderly, for he knows it a child of his own.

Presently he leads his visitors back into the house, across the mossy stones of the court, where, under glass frames, thousands of auricula have just passed their bloom, and up the outside stair to the sunny door in the house-side. He leads them into the shady dining-room, with its furniture of dark old bees-waxed mahogany, where there is a slight refreshment of wine and cake, rare old Madeira, and cake, rich with eggs and Indian spice, made by his daughter's own hand. Jars and glasses are filled with sweet-smelling flowers, and the breath of the new-blown summer comes in through the open doors.

The warm sunlight through the brown linen blind finds its way across the room, and falls with subdued radiance on the middle picture of the opposite wall. The dark eyes, bright cheeks, and cherry mouth were those of the old man's wife—the wife of his youth. She died while the smile was yet on her lip and the tear of sympathy in her eye; for she was the friend of all, and remains yet a tender memory among the neighbouring poor. The old man is never seen to look upon that picture; but on Sundays for hours he sits in reverie by his open Bible here in the room alone. In a velvet case in the corner press there, lies a silver medal. It was pinned to his breast by the Third George on a great day at Windsor long ago. For the old man peacefully ending his years here among the flowers, in his youth served the king, and fought, as a naval officer, through the French and Spanish wars. As he goes quietly about, alone, among his garden beds, perchance he hears again sometimes the hoarse word of command, the quick tread of the men, and the deep roar of the heavy guns, as his ship goes into action. The smoke of these battles rolled lowward long ago, and their glory and their wounds are alike forgotten. In that press, too, lies the wonderful ebony flute, with its marvellous confusion of silver keys, upon which he used to take pleasure in recalling the stirring airs of the fleet. It has played its last tune; the keys are untouched now, and it is

laid past, warped by age, to be fingered by its old master no more.

But his guests rise to leave, and, receiving with antique grace their courtly acknowledgments, he attends the ladies across the stone-paved hall to their carriages.

Many years ago! The old man since then has himself been carried across that hall to his long home, and no more do grand dames visit the high-walled garden. But the trees whisper yet above it; the warmth of summer heats on the gravelled walks; and the flowers, lovely as of old in their immortal youth, still open their stainless petals to the sun.

ABOUT COBRAS.

BY AN OFFICER.

WHILE at home on furlough from India a short time ago, I was much amused at finding a very general impression among my friends that to come across a cobra is an every-day kind of occurrence in India. How erroneous this idea is may be gathered from the fact that not many days ago a brother-officer told me that although he had been about ten years in India, he had never yet seen a cobra in a wild state. His is, it is true, probably an exceptional case; but still it shows that an Englishman may pass a considerable time in India without coming across one of these venomous reptiles. Cobras, however, are met with quite often enough, and sometimes in very curious and uncomfortable places. For instance, a young lady who had just returned from a ball in a small station in Southern India, noticed, as she was on the point of getting into bed, that the pillow looked disarranged; and on taking it up to smooth it out, she discovered a cobra coiled up underneath it. She called out for assistance; and her father coming to the rescue, speedily despatched the obnoxious intruder with a stick. I happened to mention this circumstance to an officer one day, and he informed me that the very same thing had happened to himself soon after his first arrival in the country, and that, in consequence, he never got into bed until he had examined the pillows.

In the year 1873, while quartered at Bellary, on going into the drawing-room of the bungalow, which at that time I shared with a friend, I discovered a cobra curled up on the sofa cushion. I hastened out of the room to fetch a stick; but in doing so, I must, I suppose, have made some noise, as on returning the snake had disappeared. A few evenings later, however, just as my 'chum' was leaving the house to go out to dinner, he called out to me that there was a snake crawling up the steps of the veranda in front of the drawing-room. I ran out with a stick, and succeeded in killing the unwelcome visitor. It turned out to be a fairly large cobra, and was in all probability the one which I had seen a few days previously on the sofa. It is, however, in the bathrooms of an Indian hungalow that cobras, when met with within doors, are most frequently encountered, as they come there in pursuit of the frogs which delight to take up their quarters there; for froggy is an article of diet to which the cobra is very partial. An officer of the Madras cavalry, since deceased,

told me that when quartered at Arcot, he one day observed in his bathroom, emerging from the waste-water pipe, the head of a cobra, which was holding in his mouth a frog. The pipe was too narrow to admit of the snake's withdrawing his head unless he released his victim; this, however, from unwillingness to forego his meal, he would not do, and in consequence, paid the penalty for his gluttony with his life.

One day, my wife's ayah came running into our bedroom saying there was a large snake in the bathroom. Arming myself as usual with a stick, I went into the bathroom just in time to see the snake disappear into the waste-water pipe, which ran under another small room to the back of the house, where the water found its outlet. The servants stationed themselves at the outlet, while I endeavored to drive the reptile out from the rear, first with my stick, and afterwards by pouring the contents of a kettle of boiling water down the pipe. Both attempts to dislodge the intruder from his position proving ineffectual, I commenced a vigorous assault on him by thrusting a bamboo about five feet long down the pipe, and this time success rewarded my efforts, and the snake, driven from his refuge, was killed by the servants outside. This cobra measured about five feet six inches in length, and was the largest that I have ever seen killed. I may here mention that the ordinary ideas about the size attained by this species of snake are greatly exaggerated. Some years ago, a surgeon-major serving in the Madras presidency, with whom I was acquainted, took a great interest in this matter, and offered a considerable reward to any one who would bring him a cobra six feet in length; but, if my memory serves me right, the reward was never gained, although a very large number of cobras were produced for his inspection.

Once I witnessed a wonderful escape from the almost invariably fatal effects of a cobra bite. I was marching with some native troops in the cold weather, and halted for the night at a place called Maikur, where, instead of having our tents pitched, my wife and I preferred occupying a small bungalow belonging to the department of Public Works, which was situated opposite the encamping-ground. Sitting outside the bungalow after dinner, I had occasion to call my head-servant to give him some orders for the next morning. As he ran up, I saw him kick something off his left foot, and at the same time he called out: 'Sāmp, sāhīh, sāmp!' ('A snake, sir, a snake!') There was a bright wood-fire burning close by, and I saw by its light the snake with its hood up. It was immediately killed by some of the camp-followers, and was brought to me, and proved to be a small cobra. On examining my servant's foot, I found one tiny puncture on the ankle, on which was a single drop of blood. The man was at once taken to the hospital tent, and attended to by the hospital assistant in medical charge of the troops, who applied ammonia and did all that was in his power. I was very anxious about the man; but he awoke me at the hour for marching next morning as if nothing had happened, and for some time apparently experienced no inconvenience. Some weeks later, however, after we had reached our destination, his left leg swelled

very much, and he suffered great pain for a considerable time; but he eventually recovered. The snake was seen by eight or ten persons besides myself, and was beyond doubt a cobra; and the only possible explanation of the man's escape seems to be that the reptile must have bitten something else very shortly before, and so to a great extent exhausted the deadly poison in its fangs.

One of our children had a narrow escape, though of a different kind, when quite a baby. My wife picked him up one day from the floor, where he was lying enjoying himself in baby fashion. She had hardly done so, when a cobra fell from the roof on the very spot on which the little one had been disporting himself the moment before.

On one occasion, a curious native superstition with regard to the subject of these notes came to my notice. A cobra which had been killed in the hut of one of the men was brought up to be shown to me, when a havildar (native sergeant) called my attention to the fact that the end of his tail was blunt, saying in Hindustani: 'Look, sāhīb; this is a downright villain; he has bitten some man, and so lost the tip of his tail.' On my making further inquiries, I was confidently assured that whenever a cobra bites a man, the tip of his tail invariably becomes blunted!

MITIS METAL.

THE introduction of wrought-iron castings by the 'Mitis process,' to which attention has lately been directed, forms a new and an important departure in the employment of this class of iron. Up to the present time, wrought-iron has been worked into the requisite forms by means of hammering; whilst a system of stamping in moulds was deemed a considerable advance in economical working. It is now, however, proposed to treat wrought-iron in the same manner as cast-iron—namely, by melting and pouring it into moulds made in sand, and corresponding in shape with the object desired. By such a process a considerable saving in the cost of production is obtained. Annealing is found to be unnecessary.

The difficulty which has hitherto barred the adoption of this method has been the high temperature to which it has been necessary to heat the iron before it became sufficiently fluid to flow into the moulds. Wrought-iron fuses at about four thousand degrees Fahrenheit, but a considerably higher temperature had to be obtained before the metal passed out of the viscid state; and on reaching this increased heat, it was found to absorb gases which caused cavities and flaws in the castings, rendering them worthless, and what are technically known in the foundry as 'wasters.' To obviate this difficulty, Peter Ostberg, a Swedish engineer, has taken advantage of the fact that the melting-point in alloys is considerably below that of their components; and by combining with the iron a small percentage of aluminium, he has succeeded in lowering the temperature of fusion of the mixture to such an extent that excellent

castings can be obtained, the temperature reached not being high enough to cause the absorption of gases. The castings are clean and sharp in form, and remarkably strong and fine in texture, being in some cases, it is said, half as tough again as the metal from which they were made. The great reduction in price cannot fail to procure for the new process an opening commensurate with its intrinsic merits.

In the United States and Sweden, Mite Metal has already established itself as an article of commerce at once reliable and economical; and there can be little doubt that the engineers of this country will avail themselves of this new form of iron, placed at their disposal by an invention which promises to rival in importance any introduced into this branch of industry for many years past.

MISSION TO DEEP-SEA FISHERMEN.

In the year 1844, the Thames Church Mission was instituted. A few years ago, an accidental development of the organisation led to the establishment of a missionary enterprise among the fishermen engaged in the North Sea. But the possibilities of the new field of labour soon justified the formation of a separate body to cope with them; and on the 30th of November 1884, the Mission to Deep-sea Fishermen was started. Its primary object is to give religious teaching to the twelve thousand men and lads who labour on the twelve fishing-fleets cruising in the North Sea. It has six smacks in its service, a seventh being, at the time of writing, on the stocks. These smacks supplement their philanthropic labours by fishing with the fleets with which they sail. Each vessel carries a missionary skipper, who, as often as the weather will permit, gathers together in his spacious hold a congregation of fellow-fishermen for worship. The earnestness of a devout mariner has often been noted; and from a short cruise the writer recently took on one of the Mission vessels, he can testify not only to the exceptional enthusiasm and fervour which characterised the services held on board, but also to the sound moral tone which, as a result of such services, prevails generally in the fleets—a condition of things in happy contrast to the riots and crimes which were rife there in former years.

But not only are the Mission vessels centres of religious instruction; each carries a quantity of healthy literature, which, circulating through the fleets, beguile many a fisherman's leisure hour of its tedium. Then, too, medicine-chests and surgical appliances are always kept on board; and with these at hand, the skipper and mate, qualified by their certificates from the St John's Ambulance Association and the National Health Society, treat the sick and injured fishermen of the fleet, who would otherwise suffer until reaching land the pangs of untreated disorders and undressed wounds. Besides this, each missionary skipper labours to promulgate temperance principles among the fleets both by personal example and gentle persuasion. Another feature of the Mission's work is the collecting and forwarding of knitted cuffs and comforters—made by friends on shore—to the North Sea fishermen, as preventives against the terrible 'sea-histers' which oil-skins produce on unprotected wrists and

necks. Lastly, we should mention that the fisherman of the fleets are encouraged to come frequently aboard the Mission vessels to join in social gossip over a mug of cocoa. Thus each of these vessels exists in the various capacities of church, library, temperance hall, dispensary, and social lounge. The methods by which the Mission has fought the 'coper' or 'floating grog-shop' are tolerably well known, and so need not be dwelt upon here.

Glancing at statistics, we note that, during last year, there were 1856 visits paid to vessels; 10,375 attendants at the seven hundred services held; 515 temperance pledges were taken; 74,127 tracts and 45,258 magazines distributed; 2725 cases medically and surgically treated; 6665 comforters, 16,210 pairs of cuffs, and 668 helmets, given away; and 626 copies of the Scriptures sold. Thus the Mission shows a most healthy growth. It has recently been established in new offices at 181 Queen Victoria Street, London, E.C.; and a new phase of its enterprise is the circulation of a twopenny monthly journal entitled *Toilers of the Deep*, being a 'record of Mission-work among them.' The magazine is an excellent one, and we commend it to all who feel an interest in the twelve thousand men and boys 'who toil through furious blast and sleety storm—who hazard their lives, and fall victims, hundreds of them, to the pitiless waves, that markets at home may be well supplied.'

LOST AT SEA.

Good-night, beloved; the light is slowly dying
From wood and field; and far away the sea
Moans deep within its bosom. Is it sighing
For those whose rest can never broken be;
For those who found their way to God; yet never
Beneath green sod may rest, the sea holds them for ever!

Yes, deep and still your grave; the ocean keeping
Whatever it gains for ever in its hold.
I know that in its depths you now are sleeping,
Quiet and dreamless as in churchyard mould;
But I have no still mound, as others, only
The memory of times past, 'mid days that now are lonely.

Buried deep with you in the sea for ever
Is all the brightest earth had once for me.
The spring returns; flowers bloom again; but never
I feel this joy in bird, and flower, and tree;
I see, but feel not as in days of yore,
Those days that can come back to me, ah, nevermore!

But yet I know that I am not forsaken.
'Lead Thou me on,' I now can calmly say.
None know the bitterness of sorrow taken
From out my heart; when I that prayer could pray,
In His own time God took you in His keeping,
All earthly sorrows past; where there is no more weeping.

HOLIDAYS IN CAMP.

ACROSS THE ATLANTIC.

IN the United States, even in the coolest, most northerly portion, the summers are long and hot; the July days are scorching and the nights are suffocating in the crowded cities and larger towns; with August comes a little change, but then come the exhausting 'dog-days,' when, though the mercury will not run so high in the thermometer, the atmosphere is as unpleasant as if it were still July.

Those who can afford it—and many who cannot do so, but fancy they must do as their wealthy neighbours do—begin in June to flit to seaside, mountain, or Springs hotel, where they pay as high a rent for a tiny room as would give them a whole house in town. Here the ladies and children stay for such a time as suits them, or as suits papa's purse. If the hotel chosen is within a reasonable distance of the men's places of business, they will flock there on Saturday night, and hasten away early on Monday morning. At some resorts, certain trains or boats have the local name, for the season, of 'husbands' train' or boat, as the case may be. The maidens who have no lover to look for at this time are on the alert to see what 'new men' Messrs So-and-so will bring with them this Saturday; for there is an appalling dearth of eligible men—eligible, if only as escorts or partners at tennis or cotillon at most of these summer resorts. Between Monday and Saturday the ladies amuse themselves with fancy-work, gossip, reading of light novels, fault-finding with the meals, or with the noise other people's children make, and flirting with the men who, taking their own holiday, are remaining at the hotel for a week or two. Then, too, there is usually, in so mixed an assembly as must necessarily be found at even the most select hotel, at least one person who has something queer, perhaps no worse than simply great eccentricity, about her, and so furnishes material to her fellow-boarders for endless speculation and gossip.

Hotel-life is so distasteful to many and so expensive, that there has of late arisen another way of summering—camping-out; but not necessarily tenting, though some prefer that. All over the northern portion of the land there are springing up like mushrooms roughly-built cottages, which are only better than a tent in that they are water-tight, have hard floors, and are not apt to be blown down at the first stiff gale. These cottages are often unpainted, or but slightly so, and have two rooms, small, down-stairs, and one large or two small rooms above; if the latter, the partition is rarely more than six feet high. When the campers are a mixed party, not simply father, mother, and children, the young men sleep down in the living-room, and the up-stairs beds are curtained off by curtains or screens. The cottage is always erected near water of some sort, old ocean having the preference, and a pinewood on the edge of a pond or lake is also popular. I remember one such spot, in Maine, where some friends of mine passed a very delightful vacation; it was a pine-grove not many miles from the city of Augusta, on the very edge of one of those hundreds of fresh-water lakelets which dot Maine so thickly. The owner of the land had erected five of these simple houses, and rented them to persons of the highest respectability, one being a High School teacher, one a Universalist minister, one an editor, and so on. The rental was very moderate—at the rate of a dollar a day for those who only wished to remain one or two weeks; but at a very much less figure if they took a cottage for the two summer months. This price included the use of all the ice they needed for the preservation of their food, and a rowboat which would hold eight persons. The campers brought their own furniture; and it is really surprising how few things one actually needs to live in comfort for a month. The pond which bears the Indian name—more easy to pronounce than to write—of Cobhasacontee, is well stocked with fish, and is dotted all over with pretty little islands, which are capital places to land and build a fire to cook the fish you have just caught. If

you have taken the precaution to bring with you a coffee-pot as well as your frying-pan, and some coffee, sugar, condensed milk, pepper, salt, and buttered bread, you can soon have a meal fit for a king—a hungry king.

How well I remember one such excursion I made two years ago! There were five in the party, none very young, and none at all in love with any one present. We two ladies were afraid to trust ourselves in the tiny sailboat which made part of our fleet of two, so we and my friend's nephew started off in the rowboat. Hardly had we got well out, however, when the sailor of the party found that his sail was not fitted to the boat it was in; and nothing would suit the men but that sails and oars must change places while passengers sat still; and in spite of our unspoken qualms and our glances of mistrust silyly exchanged with one another, we had to go under full sail after all. And how the wind did justify its title of 'fickle as a woman,' that morning! For a few moments we would scud over the water in a rather alarming style, considering that our skiff was capable of bolding only about six persons; then, after having dipped our gunwale quite as often as I liked, the breeze would vanish, the sail would hang limp and lifeless, and we were becalmed. The other boat was soon far ahead; and while we were yet within sight of our camp, the occupants had reached our destination, and were hauling in the fish with most provoking rapidity. During one of our spasmodic, rapid skims down the pond, we disturbed a mother-loon. Laughing at us in the strange, weird manner peculiar to that sort of water-fowl, she swam down the shore, trying to allure us to chase her, and not believe that there was a nest full of little loons, less hardy than the young one which was paddling along beside her, among those long sedges from which she had started out with such haste as our boat drew near them. For as much as a quarter of a mile she lured us—so she put it—away from her home, answering us when we tried to imitate her tones. Did you ever hear a loon laugh in the dusk stillness of a warm summer night? It has a queer, eerie sound—a lonesome, unhappy sound. After much tacking and drifting, we came at last to a little island where two of my friend's city neighbours, a minister and a learned judge, were camping in a tiny cottage, set in a most lovely spot, a tangle of underbrush and blackberry vines growing up to the very doorway. Little brown squirrels—so tame that at our approach they ran down the trees to see what we were doing in their domain—sprang about from tree to tree, or scampered over the soft grass, quite aware that no one would harm them while fishes were so plenty; birds twittered and sung; Eden could not have been more peaceful. There are scores of such islands to be hired or bought for a mere song.

Did you ever inspect a house kept by the average man? I have heard that men when camping are rarely in the habit of washing dishes any oftener than they can help; and since I saw the little kitchen attached to that cottage, I am sure some men, some learned men, don't worry over such trifles as greasy pans or grimy tin. The judge and his comrade had gone out for a day's fishing; we had met them on

our way down, and they cordially bade us make ourselves perfectly at home in their abode. We did so. They sent us a message, a few days later, that they wished the ladies would visit their house again. I know they hardly recognised their own cups and saucers when they went to get supper that night!

The furnishing of most of these cottages is very primitive. Comfortable beds are a *sine qua non* to those who are accustomed to hair-mattresses and plant springs, and one can sleep sweetly and restfully on a bed of dry clean hay. It is not much trouble to carry empty ticks, and dry grass or, still better, pine-needles can be had for the gathering. Blankets and thick quilts must be on hand, for, no matter what the days are, it is sure to be chilly the moment the sun is well out of sight. A cot-bed is also necessary—for friends who, in town, cannot find time to visit one, will gladly travel fifty miles to camp a day or two with their cronies who have a cottage—not only for use at night, but to be converted into a lounge in the daytime; and of course there will be hammocks to sling under the trees or on the piazza. There is always a farmer near who will gladly sell—at city prices—butter, eggs, and milk; and as most of these lakes are well stocked with fish, black bass, pickerel, trout, or perch—or if the camp is on the seashore, there are mackerel, lobsters, clams, and greedy, open-mouthed sculpin, which can devour more bait without being hooked than any ten other fish, but which make a fairly good chowder when enough are caught—no one needs suffer from hunger.

Several pretty groves on the Kennebec and Penobscot rivers are utilised for camp-meetings. Here, for a week, usually in the latter part of August—when the farmers are done haying—or the beginning of September, religious services are held morning, noon, and night, popular preachers or exhorters being invited to take part. The grounds immediately around the spot where the services are held are generally owned by a stock Company, and the regulations for the preservation of good order are very strict, and rigidly enforced: lights must be out at a given hour; unseemly mirth or secular music is not tolerated on Sunday; the sale of intoxicating liquors is not permitted at any time, nor the use of them in private tents or cottages, if it can be detected by the patrol force always on hand. These rules are absolutely necessary to prevent the freedom of camp-life from degenerating into license; for many young folks go to camp-meeting who care very little for the religious part of the affair.

The Methodists have the largest number of camp-grounds; but other denominations are more or less fond of them. I once visited a Spiritualist camp-ground on one of these Maine rivers; and a damper, more ghostly spot could not well be imagined; everything and everybody looked mouldy, and one might, without much stretch of the imagination, expect to see a materialised spirit pop up anywhere. I understand, however, that there were never any 'manifestations' at camp; it was only held for the dissemination of their peculiar faith.

A party of about a dozen boys and four or five men have gone for the past six years to a little

island in a New Hampshire lake not far from Lake Winnepesaukee, which is a favorite summer resort on account of its beautiful scenery, to pass the months of July and August. Their temporary dwelling is very primitive, not much more than a roof and three walls, for they intend to spend all their time in the open air. Every Sunday afternoon these boys have hold religious services; they have a small parlour organ, and form a choir themselves. They intend this year, if possible, to have their choir properly vested, for their service is according to the Book of Common Prayer. There is not a church of any sort within a long distance, for this portion of the State is rather thinly settled. It is of New Hampshire that residents of other States say that the farmers there have to sharpen the noses of the sheep, in order that they may crop the grass between the rocks, as New Hampshire is all rocks. The natives attend the boys' service as a treat, though, as the church is not very well known there, they are not quite sure that they approve of the ceremonial. The service is not always lay, however; several distinguished clergy and one or two bishops have visited this little camp and have preached for them. One of the boys told me that during these six years there had been but one Sunday when it rained so hard that they had to hold service in their hut. Doubtless, some day there will be a permanent chapel there.

And oh, what good times the little ones have at these camps! No fine clothes to be kept clean; no attractive but forbidden alley children to be avoided; no danger of being run over; no cross dogs to fear; and no venturing out in the water without the knowledge of mamma or nurse, for here no one is too busy to have one eye on the little mischiefs; but as much paddling about on the brink of the lake or ocean as would a high: any small heart. And then, too, for mamma's side of the question: no candy-shops to draw the pennies out of her pocket, or the tears from disappointed eyes; no coaxing, 'Can't we go play with So-and-so?' no scarlet fever or measles to be caught from some neighbour's progeny; no evil influences to be feared for the older boys and girls; and no parties to be made for or attended by the children.

Mother Nature is a great restorer, and a few days of uninterrupted intercourse with her do more to renew the wasted health or relaxed energies, than as many weeks of dress and gaiety at a fashionable resort; and so sensible people are becoming more and more convinced.

IN ALL SHADES.

CHAPTER XII.

BEFORE the yelling mob could close again round Harry Noel's fallen body, with their wild onslaught of upraised cutlasses, more dangerous to one another in the thick press than to the prostrate Englishman or to poor fainting and unconscious Nora, another hasty clatter of horse's hoofs burst upon them from behind, up the hilly pathway, and a loud, clear, commanding voice called out in resonant tones that overtopped and stilled for a moment the tumultuous murmur of negro shrieks: 'In the Queen's name—in the Queen's name, hold; disperse there!'

That familiar adjuration acted like magic on the fierce and half-naked throng of ignorant and superstitious plantation negroes. It was indeed to them a mighty word to conjure with, that loud challenge in the name of the great distant Queen, whose reality seemed as far away from them and as utterly removed from their little sphere as heaven itself. They dropped their cutlasses instantly, for a brief moment of doubt and hesitation; a few voices still shouted fiercely, 'Kill him—kill him!' and then a unanimous cry arose among all the surging mass of wild and scowling black humanity: 'Mr Hawthorn, Mr Hawthorn! Him come in Missis Queen name, so gib us warnin'. Now us gwine to get justice. Mr Hawthorn, Mr Hawthorn!'

But while the creole-born plantation hands thus welcomed eagerly what they looked upon, in their simplicity, as the Queen's direct mouth-piece and representative, Louis Delgado, his face distorted with rage, and his arms plying his cutlass desperately, frowned and gnashed his teeth more fiercely than ever with rage and disappointment; for his wild African passion was now fully aroused, and like the tiger that has once tasted blood, he would not be balked of the final vengeful delight of hacking his helpless victim slowly to pieces in a long-drawn torture. 'Missis Queen!' he cried contemptuously, turning round and brandishing his cutlass with savage joy once more before the eyes of his half-sobered companions—'Missis Queen, him say dar! Ha, ha, what him say dar for? What do Queen to me, I want you tell me? I don't care for Queen, or judge, or magistrate, or nuffin! I gwine to kill all de white men togedder, in all Trinidad, de Lord helpin' me!'

As he spoke, Edward Hawthorn jumped hastily from his saddle, and advanced with long strides towards the fiercely gesticulating and mumbling African. The plantation negroes, cowed and tamed for the moment by Edward's bold and resolute presence, and overawed by the great name of that mysterious, unknown, half-mythical Queen Victoria, beyond the vast illimitable ocean, fell back sullenly to right and left, and made a little lane through the middle of the crowd for the Queen's representative to mount the staircase. Edward strode up, without casting a single glance on either side, to where Delgado stood savagely beside Harry Noel's fallen body, and put his right hand with an air of indisputable authority upon the frantic African's uplifted arm. Delgado tried to shake him off suddenly with a quick, adroit, convulsive movement; but Edward's grip was tight and vice-like, and he held the black arm powerless in his grasp, as he spoke aloud a few words in some unknown language, which sounded to the group of wondering negroes like utter gibberish—or perhaps some strange spell with which the representative of Queen Victoria knew how to conjure by some still more potent and terrible omen than even Delgado's.

But Louis Delgado alone knew that the words were Arabic, and that Edward Hawthorn grasped his arm: 'In the name of Allah, the All-wise, the most Powerful!'

At the sound of that mighty spell, a powerful one, indeed, to the fierce, old, half-christianised Mohammedan, Delgado's arm dropped powerless to his trembling side, and he fell back,

gnashing his teeth like a hulking harked of a fight, into the general mass of plantation negroes. There he stood, dazed and stunned apparently, leaning up sulkily against the piazza post, but speaking not a word to either party for, good or for evil.

The lull was but for a minute; and Edward Hawthorn saw at once that if he was to gain any permanent advantage by the momentary change of feeling in the fickle negro mob, he must keep their attention distracted for a while, till their savage passions had time to cool a little, and the effect of this unwonted orgy of fire and bloodshed had passed away before the influence of sober reflection. A negro crowd is like a single creature of impulse—swayed to and fro a hundred times more easily than even a European mob by every momentary passing wave of anger or of feeling.

'Take up Mr Noel and Miss Dupuy,' he said aside in his cool commanding tone to the Orange Grove servants:—'Mr Noel isn't dead—I see him breathing yet—and lay them on a bed and look after them, while I speak to these angry people.' Then he turned, mastering himself with an effort for that terrible crisis, and taking a chair from the piazza, he mounted it quickly, and began to speak in a loud voice, unbroken by a single tremor of fear, like one addressing a public meeting, to the great sea of wondering, upturned black faces, lighted up from behind in lurid gleams by the red glare of the still blazing cane-houses.

'My friends,' he said, holding his hand before him, palm outward, in a mute appeal for silence and a fair hearing, 'listen to me for a moment. I want to speak to you; I want to help you to what you yourselves are blindly seeking. I am here to-night as Queen Victoria's delegate and representative. Queen Victoria has your welfare and interest at heart; and she has sent me out to this island to do equal justice between black man and white man, and to see that no one oppresses another by force or fraud, by lawlessness or cunning. As you all know, I am in part a man of your own blood; and Queen Victoria, in sending me out to judge between you, and in appointing so many of your own race to posts of honour here in Trinidad, has shown her wish to favour no one particular class or colour to the detriment or humiliation of the others. But in doing as I see you have done to-night—in burning down factories, in attacking houses, in killing or trying to kill your own employers, and helpless women, and men who have done no crime against you except trying to protect your victims from your cruel vengeance—in doing this, my friends, you have not done wisely. That is not the way to get what you want from Queen Victoria.—What is it you want? Tell me that. That is the first thing. If it is anything reasonable, the Queen will grant it. What do you want from Queen Victoria?'

With one voice the whole crowd of lurid upturned black faces answered loudly and earnestly: 'Justice, justice!'

Edward paused a moment, with rhetorical skill, and looked down at the mob of shouting lips with a face half of sternness and half of benevolence. 'My friends,' he said again, 'you shall have justice. You haven't always had it in the

past—that I know and regret; but you shall have it, trust me, henceforth in the future. Listen to me. I know you have often suffered injustice. Your rights have not been always respected, and your feelings have many times been ruthlessly trampled upon. Nobody sympathises with you more fully than I do. But just because I sympathise with you so greatly, I feel it my duty to warn you most earnestly against acting any longer as you have been acting this evening. I am your friend—you know I am your friend. From me, I trust, you have never had anything less than equal justice.'

'Dat's true—dat's true!' rang in a murmuring wave of assent from the eager listening crowd of negroes.

'Well,' Edward went on, lowering his tone to more persuasive accents, 'be advised by me, then, and if you want to get what you ask from Queen Victoria, do as I tell you. Disperse to-night quietly and separately. Don't go off in a body together and talk with one another excitedly around your watch-fires about your wrongs and your grievances. Burn no more factories and cane-houses. Attack no more helpless men and innocent women. Think no more of your rights for the present. But go each man to his own hut, and wait to see what Queen Victoria will do for you.—If you continue foolishly to burn and riot, shall I tell you in plain words what will happen to you? The governor will be obliged to bring out the soldiers and the volunteers against you; they will call upon you, as I call upon you now, in the Queen's name, to lay down your pistols and your guns and your cutlasses; and if you don't lay them down at once, they will fire upon you, and disperse you easily. Don't be deceived. Don't believe that because you are more numerous—because there are so many more of you than of the white men—you could conquer them and kill them by main force, if it ever came to open fighting. The soldiers, with their regular drill and their good arms and their constant training, could shoot you all down with the greatest ease, in spite of your numbers and your pistols and your cutlasses. I don't say this to frighten you or to threaten you; I say it as your friend, because I don't want you foolishly to expose yourselves to such a terrible butchery and slaughter.'

A murmur went through the crowd once more, and they looked dubiously and inquiringly toward Louis Delgado. But the African gave no sign and made no answer; he merely stood sullenly still by the post against which he was leaning; so Edward hastened to reassure the undecided mob of listening negroes by turning quickly to the other side of the moot question.

'Now, listen again,' he said, 'for what I'm going to say to you now is very important. If you will disperse, and go each to his own home, without any further trouble or riot, I will undertake, myself, to go to England on purpose for you, and tell Queen Victoria herself about all your troubles. I will tell her that you haven't always been justly treated, and I'll try to get new and better laws made in future for you, under which you may secure more justice than you sometimes get under present arrangements. Do you understand me? If you go home at once, I promise to go across the sea and speak

to Queen Victoria herself on your behalf, over in England.'

The view of British constitutional procedure implied in Edward Hawthorn's words was not perhaps strictly accurate; but his negro hearers would hardly have felt so much impressed if he had offered to lay their grievances boldly at the foot of that impersonal entity, the Colonial Office; while the idea that they were to have a direct spokesman, partly of their own blood, with the Queen herself, flattered their simple African susceptibilities and helped to cool their savage anger. Like children as they are, they began to smile and show their great white teeth in infantile satisfaction, as pleasantly as though they had never dreamt ten minutes earlier of hacking Harry Noel's body fiercely into little pieces; and more than one voice cried out in hearty tones: 'Hoorrah for Mr Hawthorn! Him de black man fren.' Gih him a cheer, boys! Him gwine to 'peak for us to Queen Victoria!'

'Then promise me faithfully,' Edward said, holding out his hand once more before him, 'that you'll all go home this very minute and settle down quietly in your own houses.'

'We promise, sah,' a dozen voices answered eagerly.

Edward Hawthorn turned anxiously for a moment to Louis Delgado. 'My brother,' he said to him rapidly in Arabic, 'this is your doing. You must help me now to quiet the people you have first so fiercely and so foolishly excited. Assist me in dispersing them, and I will try to lighten for you the punishment which will surely be inflicted upon you as ringleader, when this is all over.'

But Delgado, propped in a stony attitude against the great wooden post of the piazza, answered still never a word. He stood there to all appearance in stolid and sullen indifference to all that was passing so vividly around him, with his white and bloodshot eyes staring vacantly into the blank darkness that stretched in front of him, behind the flickering light of the now collapsed and burnt-out cane-houses.

Edward touched him lightly on his bare arm. To his utter horror and amazement, though not cold, it was soft and corpse-like, as in the first hour of death, before rigidity and chilliness have begun to set in. He looked up into the bloodshot eyes. Their staring balls seemed already glazed and vacuous, utterly vacant of the fierce flashing light that had gleamed from the pupils so awfully and savagely but ten minutes before, as he brandished his cutlass with frantic yells above Harry Noel's fallen body. Two of the plantation negroes, attracted by Edward's evident recoil of horror, came forward with curiosity, flinging down their cutlasses, and touched the soft cheeks, not with the reverent touch which a white man feels always due to the sacredness of death, but harshly and rudely, as one might any day touch a senseless piece of stone or timber.

Edward looked at them with a pallid face of mute inquiry. The youngest of the two negroes drew back for a second, overtaken apparently by a superstitious fear, and murmured low in an awestruck voice: 'Him dead, sah, dead—stone dead. Dead dis ten minute, since ever you begin to 'peak to de people, sah.'

He was indeed. His suppressed rage at the

partial failure of his deeply cherished scheme of vengeance on the hated white men, coming so close upon his paroxysm of triumph over the senseless bodies of Mr Dupuy and Harry Noel, had brought about a sudden fit of cardiac apoplexy. The old African's savage heart had burst outright with conflicting emotions. Leaning back upon the pillar for support, as he felt the blood failing within him, he had died suddenly and unobserved without a word or a cry, and had stood there still, as men will often stand under similar circumstances, propped up against the supporting pillar, in the exact attitude in which death had first overtaken him. In the very crisis of his victory and his defeat, he had been called away suddenly to answer for his conduct before a higher tribunal than the one with which Edward Hawthorn had so gently and forbearingly threatened him.

The effect of this sudden catastrophe upon the impressionable minds of the excited negroes was indeed immediate and overwhelming. Lifting up their voices in loud wails and keening, as at their midnight wakes, they cried tremulously one after another: 'De Lard is against us—de Lard is against us! Ebbery man to your tents, O Israel! De Lard hab killed Delgado—hab killed Delgado—hab sniken him down, for de murder him committed!' To their unquestioning antique faith, it was the visible judgment of heaven against their insurrection, the blood of Theodore Dupuy and Harry Noel crying out for vengeance from the floor of the piazza, like the blood of righteous Abel long before, crying out for vengeance from the soil of Eden.

More than one of them believed in his heart, too, that the mysterious words in the unknown language which Edward Hawthorn had muttered over the old African were the spell that had brought down upon him before their very eyes the unseen bolt of the invisible powers. Whether it were obeh, or whether it were imprecation and solemn prayer to the God of heaven, they thought within themselves, in their dim, inarticulate, unspoken fashion, that 'Mr Hawthorn would bring down de judgment dat very minute on Louis Delgado.'

In an incredibly short space of time, the great crowd of black faces had melted away as quickly as it came, and Edward Hawthorn was left alone in the piazza, with none but the terrified servants of the Orange Grove household to help him in his task or to listen to his orders. All that night long, across the dark gorge and the black mangrove, they could hear the terrified voices of the negroes in their huts singing hymns, and crying aloud in strange prayers to God in heaven, that the guilt of this murder might not be visited upon their heads, as it had been visited before their very eyes that night on Louis Delgado. To the negro mind, the verdict of fate is the verdict of heaven.

'Take up his body, too, and lay it down on the sofa,' Edward said to Uncle 'Zekiel, still beside himself with terror at the manifold horrors of this tragical evening.

'I don't can dare, sah,' Uncle 'Zekiel answered, tremulously.—'I don't can dare lay me hand upon de corpse, I tellin' you, sah. De finger ob de Lard has snite Delgado. I don't dare to lift an' carry him.'

'One of you boys,' then, come and help me,' Edward cried, holding up the corpse with one hand to keep it from falling.

But not one of them dared move a single step nearer to the terrible awe-inspiring object.

At last, finding that no help was forthcoming on any hand, Edward lifted up the ghastly burden all by himself in his own arms, and laid it down reverently and gently on the piazza sofa. 'It is better so,' he murmured to himself slowly and pitifully. 'There will be no more blood on either side, shed at any rate for this awful evening's sorry business.'

And then at length he had leisure to turn back into the house itself and make inquiries after Mr Dupuy and Harry and Nora.

WILD-BEES AND BEE-HUNTING.

THERE are, it is said, no fewer than twenty-seven genera, and one hundred and seventy-seven species of bees, natives of Great Britain. But one only of all these, the *Apis mellifica*, or common honey-bee, has been domesticated. Attempts have been made with others, especially with the *bombus*, or humble-bee, but without any adequate success.

The frequent mention of honey in the Old Testament from the patriarchal ages downward, and the description of Palestine as 'a land flowing with milk and honey,' may well have raised the question whether the honey was obtained from bees in a wild condition or in a state of domestication. The weight of evidence is in favour of the former. In the somewhat wandering life, as 'strangers and pilgrims,' which many of the patriarchs led, bee-culture would have been very inconvenient, if not impossible; and as honey was to be had in rich abundance simply for the seeking, there would be little inducement to undertake unnecessary cares and labours in the domestication of the native variety. There is no question, however, as to the possibility of inducing wild bees to accept domestication. In Cashmere and the north of India, the natives have a simple and ready method of doing this: in building their houses, they leave cavities in one of the walls having a sunny aspect, with a small hole like that of a modern hive opening outwards. The inner side of the wall is fitted with a frame of wood with a door attached. A swarm of bees in search of a new home—or perhaps the pioneers who are sent, a day or two before the actual swarming, to seek out a dwelling-place—would be attracted by such an 'open door,' and the family, or army, ten, twenty, or thirty thousand strong, would at once take possession. The vacant space would soon be filled by the busy workers; and the inmates of the house, having access to the store by means of the open door, could move a comb or two at pleasure, without distressing the bees, simply using the precaution of blowing in as much smoke at the back as would cause the bees to fly out at the front. English travellers report

having seen the operation performed, and the bees quietly return when the work was done. The plan has been recommended for use in this country. It is at least practicable, if not necessary. In dwelling-houses there might be risks, which would not apply to farm-buildings and erections around a country house. But if man has not utilised this plan, the bees themselves have acted upon it. An instance of two within the writer's own knowledge may not be uninteresting.

I was the tenant of Rose Cottage, Branchley, Kent, from 1853 to 1862. The house—which has been considerably altered since—was well adapted for such a purpose. The upper parts of the walls were formed, as is common in that part of the county, externally of tiles on a framework of wood, and internally of lath and plaster. In the cavities there would be ample space for large stores of comb and honey. A swarm of bees took possession of a portion of the front wall, having a south-south-eastern aspect, entering their abode through a crevice between the tiles just over one of the chamber windows. They held possession for several years, and still held their own when I left the cottage. As they never swarmed, it is almost certain there must have been a large collection of honey; but for some reason or other, chiefly, no doubt, on account of the difficulty of taking the honey without injuring the house and exposing the whole family to the attacks of the bees, I profited in no way by their busy labours.

Less than ten years ago, when making a call at the old farmhouse, Penkros, Lyonsall, Herefordshire, my attention was directed to a colony of bees which had made a settlement in the upper part of one of the walls of the house. I suggested the removal of a portion of the inner wall, and predicted a large 'find.' After some time, this advice was acted on; but the farmer adopted a plan which I should have strongly deprecated—the plan of destroying with brimstone the entire bee community. The store of honey was so great that every available keeler and pan in the house was filled to the extent of nearly two hundredweight.

Two other instances may be cited, as reported in the *West Surrey Times*. One is that of an extraordinary 'take' of honey from the walls of the *Haulboy and Little Inn*, Ockham, Surrey. The outer walls of the house are about three feet in thickness, and at the very top of the third story a colony of bees had established themselves, holding undisturbed possession for a number of years. At length the innkeeper determined to find out their whereabouts. After a diligent search under the roof, a piece of comb was found. Descending to one of the upper bedrooms, chisel and hammer went to work, and a square of about two feet was opened in the front wall; here a large mass of comb was discovered; and after fumigating the bees, about one hundred and twenty pounds of honey were secured. Another and still more extraordinary 'take' of honey was secured at Winter's Hall, Bramley, Surrey, the seat of Mr George Barrett. Some bees had long

held possession of a space between the ceiling of the coachhouse and the granary: on effecting an entrance, about three hundredweight of honey was secured.

In some countries the honey-bee still roams at will and uncontrolled; this is notably the case in the western parts of the United States and Canada. The discovery of their natural hives for the purpose of securing the honey is the calling of a class of persons known as bee-hunters. A writer of considerable repute thus speaks on this subject: 'The beautiful forests in which we were encamped abounded in bee-trees; that is to say, trees in the decayed trunks of which wild-bees had established their hives. It is surprising in what countless swarms the bees have overspread the Far West within but a moderate number of years. The Indians consider them the harbinger of the white man, as the buffalo is of the red man, and say that in proportion as the bee advances, the Indian and the buffalo retire. We are always accustomed to associate the hum of the beehive with the farmhouse and the flower-garden, and to consider those industrious little animals as connected with the busy haunts of men; and I am told that the wild-bee is seldom to be met with at any great distance from the frontier. They have been the heralds of civilisation, steadily preceding it, as it advanced from the Atlantic borders; and some of the ancient (early) settlers of the West pretend to give the very year when the honey-bee first crossed the Mississippi. The Indians, with surprise, found the mouldering trees of their forests suddenly teeming with ambrosial sweets; and nothing, I am told, can exceed the greedy relish with which they banquet for the first time upon the unbought luxury of the wilderness. At present, the honey-bee swarms in myriads in the noble groves and forests that skirt and intersect the prairies and extend along the alluvial bottoms of the rivers. It seems to me as if these beautiful regions answer literally to the description of the land of promise, "a land flowing with milk and honey;" for the rich pasturage of the prairies is calculated to sustain herds of cattle as countless as the sands upon the seashore; while the flowers with which they are enamelled render them a very paradise for the nectar-seeking bee.'

A bee-hunt must be a very exciting adventure, and, as most people would think, attended with considerable risk; but the ingenuity of the settlers, and especially of the bee-hunters, who make a living of the business, is equal to the occasion. Let us, for the sake of greater brevity, suppose a case, which is, however, little other than a narrative of simple facts. A party sets out in quest of a bee-tree—a tree in the cavity of which a colony of bees have established themselves. The party is headed by a veteran bee-hunter, a tall lank fellow, with his homespun dress hanging loosely about him, and a hat which might be taken for a beeskep. A man similarly attired attends him, with a long rifle on his shoulder. The rest of the party, six in number, are armed with axes and rifles. Thus accoutred, they are ready for any sport, or even more serious business. Reaching an open glade on the skirts of the forest, the party halts, and the leader advances to a low bush, on which he

places a piece of honeycomb. This is a lure for the bees. In a very short time several are humming about it and diving into the cells. Laden with honey, they rise into the air and dart off in a straight line with almost the velocity of a bullet. The hunters watch attentively the course they take, and set off in the same direction, still watching the course of the bees. In this way the tree where the bees have made their hives is reached. But it will often happen, as may be suspected, that the bees will elude the sight of the most vigilant hunter, and the party may wander about without succeeding in finding any treasure. Another method is then adopted: a few bees are caught and placed in a small box with a glass top, having at the bottom a small piece of honeycomb. When they have satisfied themselves with honey, two or three are allowed to escape, the hunters taking care to observe the direction of their flight and to follow them as rapidly as possible. When these bees are lost sight of, two or three others are set free and their course followed, and so on until the identical tree has been reached. It sometimes happens that one set of bees take an opposite course to their predecessors. The hunter knows by this that no has passed the tree, or otherwise missed his mark, and he retraces his steps and follows the lead of the unerring bees. The sight of the bee is so strong and keen that it can descry its home at an immense distance. It is a well-ascertained fact that if a bee be caught on a flower at any given distance south of its home, and then be taken in a close box an equal distance north of it, the little creature, when set free, after flying in a circle for a moment, will take a straight course to its identical tree. Therefore, the hunter who has intelligence, patience, and perseverance on his side is sure to be successful in the end.

It not infrequently happens that when in the immediate neighbourhood of the tree, the hunter may not be able to distinguish the particular one he is searching for from the rest, as the entrance to the bee-castle is commonly many feet above the ground. He is not then at the end of his resources. A small fire is kindled, and upon a piece of stone or other suitable material made hot, some honeycomb is placed; the smell will at once induce the whole colony of bees to come down from their citadel, when the hunters proceed with their axes to bring down the tree. A vigorous writer thus describes the proceedings, when the party of hunters had traced the honey-laden bees to their hive in the hollow trunk of a blasted oak, "into which, after buzzing about for a time, they entered at a hole about sixty feet from the ground: 'Two of the bee-hunters now plied their axes vigorously at the foot of the tree, to level it with the ground. The mere spectators and amateurs in the meantime drew off to a cautious distance, to be out of the way of the falling of the tree and the vengeance of its inmates. The jarring blows of the axe seemed to have no effect in alarming or agitating this most industrious community; they continued to ply at their usual occupations; some arriving full-laden to port, others sallying forth on new expeditions, like so many merchantmen in a money-making metropolis, little suspicious of impending bankruptcy and downfall.

Even a loud crack, which announced the disrapture of the trunk, failed to divert their attention from the intense pursuit of gain. At length, down came the tree with a tremendous crash, bursting open from end to end, and displaying all the hoarded treasures of the commonwealth. One of the hunters immediately ran up with a wisp of lighted hay, as a defence against the bees. The latter, however, made no attack, and sought no revenge; they seemed stupefied by the catastrophe and unsuspecting of its cause, remaining crawling and buzzing about the ruins, without offering us any molestation.

When the tree had been brought down, the whole party fell to with spoon and hunting-knife to scoop out the combs with which the hollow trunk was stored. A single tree has been known to yield from one hundredweight to one and a half hundredweight.

'Some of the combs were old and of a deep brown colour; others were beautifully white, and the honey in their cells was almost limpid. Such of the combs as were entire were placed in camp kettles, to be conveyed to the encampment; those which had been broken by the fall were devoured on the spot. Every stark bee-hunter was to be seen with a rich morsel in his hand, dripping about his fingers, and disappearing as rapidly as a cream tart before the holiday appetite of a schoolboy.'

Not in America alone, but in Africa also, the wild-bee is an object of pursuit by the natives. Even the Hottentots show considerable shrewdness in obtaining the wild-honey. The author of an *Expedition into the Interior of Africa* thus describes an operation of this kind: 'One of the Hottentots observed a number of bees entering a hole in the ground which had formerly belonged to some animal of the wasel kind. As he made signs for us to come to him, we turned that way, fearing he had met with some accident.' It was the home of a recent swarm. 'When the people began to unearth the bees, I did not expect that we should escape being severely stung; but they knew so well how to manage an affair of this kind, that they robbed the poor bees with the greatest ease and safety. Before they commenced digging, a fire was made near the hole, and constantly supplied with damp fuel, to produce a cloud of smoke. In this the workmen were completely enveloped, so that the bees returning from the field were prevented approaching, and those which flew out of the nest were driven by it to a distance.'

The same writer mentions another incident, even more interesting. 'Whilst I was engaged in the chase one day on foot with a Namaqua attendant, he picked up a small stone; he looked at it earnestly, then over the plain, and threw it down again. I asked what it was. He said there was the mark of a bee on it. Taking it up, I also saw on it a small poifted drop of wax, which had fallen from the bee in its flight. The Namaqua noticed the direction the point of the drop indicated, and walking on, he picked up another stone, also with a drop of wax on it, and so on at considerable intervals, till, getting behind a crag, he looked up, and bees were seen flying across the sky and in and out of a cleft in the face of the rock. Here, of course, was the honey he was in pursuit of. A dry bush was

selected, a fire was made, the cliff ascended, and the nest robbed in the smoke.'

An amusing anecdote is related in *Feminine Monarchy*, an old book printed in 1609, and given by a Russian ambassador to Rome as 'written out of experience by Charles Butler.' A man was out in the woods searching for honey. Climbing a large hollow tree, he discovered an immense 'find' of the luscious produce. By some means however, he missed his footing, and slipped into the hollow, sinking up to his breast in honey. He struggled to get out, but without avail. He called and shouted, but alike in vain. He was far from human habitation, and help there was none, for no one heard his cries. At length, when he had begun to despair of deliverance, he was extricated in a most remarkable and unexpected way. Strange to say, another honey-hunter came to the same tree in the person of a large bear, which, smelling the honey, the scent of which had been diffused by the efforts of the imprisoned man, mounted the tree and began to lower himself, hind-part first, into the hollow. The hunter, rightly concluding that the worst could be but death, which he was certain of if he remained where he was, clasped the bear around the loins with both hands, at the same time shouting with all his strength. The bear, what with the handling and the shouting, was very seriously frightened, and made speed to get out of his fix. The man held fast, and the bear pulled until, with his immense strength, he drew the man fairly out of his strange prison. The bear being released, made the best of his way off, more frightened than hurt, leaving the man, as the story quaintly says, 'in joyful fear.'

We conclude this paper with a story of another kind, a version of which was given some years ago in a contemporary; but the French bishop was turned into an English prelate, and the bee-keeping curé into an Anglican clergyman, the story being otherwise greatly changed. The said French bishop, while paying a visit to his clergy, was much distressed by the extreme poverty which met him everywhere. Reaching the house of a certain curate who lived in the midst of very poor parishioners, where he expected to witness even greater destitution, he was astonished to find that everything about the house wore an appearance of comfort and plenty. Greatly surprised by what he saw, the bishop asked: 'How is this, my friend? You are the first pastor I have seen having a cheerful face and a plentiful board. Have you any income independent of your cure?'

'Yes,' said the curé, 'I have. My household would otherwise starve on the pittance I receive from my poor people. If you will walk into the garden, I will show you the stock which yields me such excellent interest.'

On going into the garden, the bishop saw a long range of beehives.

'There,' said the curé, 'there is the bank from which I draw an annual dividend; and it is one that never stops payment.'

The fact was that his honey supplied the place of sugar, leaving him a considerable quantity for sale, in addition to other household uses. Then, of the washings of the comb and refuse honey he manufactured a very palatable wine; while the wax went far to pay his shoemaker's bill.

Ever afterwards, it is said, when any of the clergy complained to the bishop of poverty, he would tell the story of the bee-keeping curé, following up his anecdote with the advice: 'Keep bees—keep bees!'

A FRIEND OF THE FAMILY.

CHAPTER III.—A GRAVE ACCUSATION.

THUS valiant, the Major entered the library at the appointed time. He was, however, taken aback on finding that it was not only the gentlemen he had to confront, but also two of the ladies—Mrs Joseph and Mrs John. Nellie had positively refused to be present. He had not bargained for an examination in the presence of the ladies, for he could not say before them what he must say in order to exculpate himself. He felt that he was being very unfairly treated. But he was thankful for small mercies. They might have had Miss Euphemia in to witness his humiliation—for humiliation it must be to confess his stupidity in despatching the letters in the wrong envelopes.

The Squire was seated at his writing-table, and assumed something of his magisterial air (he was a J.P.) as he requested the Major to take a chair. The three letters were on the desk before him; and he proceeded to read them carefully, whilst profound silence prevailed. Mrs Joseph darted angry glances alternately at her husband and the culprit. Mrs John looked more serious than usual, but still showed symptoms of an inclination to titter. John Elliott stood in the shadow of a large bookcase; Maynard near the window which opened to the terrace, impatiently twirling his moustache and at intervals glancing fiercely towards the Major, who, in his indignation at the whole proceeding, returned the glance in a like spirit.

The Squire cleared his throat with a raucous cough. 'You have placed me in a most painful position, Major,' he began with an evident desire to be friendly, which was checked by the frown of his wife. 'I am as tolerant as anybody of a joke. You know that well enough, Dawkins; but I can't stand such a hoax as you have played upon us in sending these letters here.'

The Major rose; he felt so much injured, that he was calm. 'My dear friend Elliott—'

'Oh, confound it—there's the beginning of the plaguy things,' ejaculated the Squire.

'Allow me to explain. I intended no hoax. These letters were written with an earnest desire to avert misunderstanding. Unfortunately, in my agitation and haste, I blundered.'

'Not a hoax—not a joke!' bellowed the Squire, rising to his feet and thrusting the letters into a drawer of the table. 'Do you mean to say, then, that I suspected my wife of anything?'

'No.'

'Do you mean to say that a word could be spoken about me in association with any one which could or should cause Nellie—Miss Carroll—to be displeased with me?' broke in Maynard threateningly.

'No.'

'Do you mean to say that I am in any way involved with another lady?' snapped Elliott of Arrowby.

'No.'

'Stop a minute,' interposed Mrs John, in her light-hearted way, coming to the rescue of Major Dawkins, and turning to her husband. 'The Major did not say you were involved, John; he only warned me not to mind any nonsense I might hear about you. Give our friend time to explain.'

'I am grateful for your intercession, madam,' said the Major stiffly. 'If your husband has read the letter which, as I have told you, fell into Mrs Joseph's hands by mischance, he knows precisely how the matter stands, and I request him to explain, or to speak to me in private.'

'I have read the letter, of course,' was the peevish response of John Elliott; 'and it does not suggest anything for me to explain, or why you should require a private interview with me.'

The Major had the opportunity to avenge himself on the instant by stating before them all why he had written the letters. But Mrs John was evidently quite ignorant of her husband's suspicions; why should he pain her by revealing them? The outcome of the revelation would be an inevitable rupture between the man and wife. Nellie Carroll had not heard John Elliott's scandal about Maynard; why should he, for his own convenience, stir the stagnant pool and increase the distress he had already unintentionally caused? No; he would not do that. He had blundered, and must pay the penalty.

'Since Mr John Elliott declines to say anything or to grant me a private interview,' said the Major firmly, 'the affair must end here. I withdraw everything that is written in these unlucky letters, and request you to give them back to me, so that they may be at once destroyed.'

'That won't do,' rejoined the Squire gruffly; 'if you won't make the thing clear to us, it has gone too far to end here. I shall place the letters in the hands of my solicitor to-morrow morning, and leave him to arrange with you.'

'In that case, you will provoke a family scandal which will cause you all much vexation, and cannot possibly do good to anybody.'

'It will at least teach some person a serious lesson,' observed Mrs Joseph sternly.

'O madam, the lesson has been learned already,' answered the Major bitterly. 'But since you, Squire, are not satisfied that I am sufficiently punished for my mistake by the loss of your friendship, but also mean to take legal proceedings, I must summon a friend from town who will convince you that the trouble did not originate with me.'

'So be it, Major Dawkins; and as things stand, I shall expect your visit to Todhurst to terminate to-morrow,' said the Squire, getting the inopportune words out with much difficulty.

'It would terminate this instant, were it not that I still desire to serve you and your family. So much you will acknowledge to-morrow, and then my presence will no longer disturb you.'

There was a degree of dignity in the Major's retreat which impressed everybody except the hot-headed lover, Maynard, who muttered between

his teeth: 'If this were not my friend's house, I would horsewhip the little beggar.' As he could not enjoy that luxury, he occupied his talents in seeking a reconciliation with Nellie, and unluckily, but naturally, besought the aid of Mrs John. His conversations with her in the drawing-room and on the lawn again irritated the suspicious husband, who, instead of speaking out frankly, endeavoured to hide the bitter thoughts which were passing through his mind, and became more abstracted and more disagreeable than ever.

Mrs Joseph perversely held to her opinion that this guest had 'something' to say which she ought to know.

'But you don't mean to say, Kitty,' the Squire expostulated, 'that if I had any fault to find with you I should not speak it straight out to yourself, instead of blabbing it to other folk? Past experience ought to make you sure that when I am not pleased, you will hear about it soon enough.'

'I know that perfectly well—there is no lack of fault-finding on your part to myself; and how am I to tell what you have been saying about me to others?' retorted Mrs Joseph, whose temper being once roused, as has been stated, was not easily allayed.

'Nonsense, Kitty—you don't believe that I would speak about you to outsiders.—Come, now; drop this humbug, for you know it is humbug; and, 'pon my honour, I think we have been too hard on poor Dawkins.'

'Before deciding on that point, I shall wait to hear what this friend his is summoning from London has to say to-morrow.'

'I take his word for it, that there was a mistake.'

'Then he should not make such a mistake, and baying made it, ought to suffer the consequences.'

'But, my dear, don't you see that he is taking the consequences?—and infernally unpleasant ones they are. I tell you there is nothing in it; and if he had only said it was all a joke, I should have been satisfied.'

'But he said it was not a joke, and told you that if you prosecuted him, it would result in a grave family scandal. How can you answer that?'

'I can't, and he wouldn't; so we must wait for the person who will.'

There was a kind of armed truce declared in this way between the husband and wife—she feeling guiltily conscious that she was somehow making a mountain of a molehill; and he feeling perfectly sure of it.

The Major went straight to his room, resolved that he would hold no intercourse with the family until Mrs John's brother, Matt Willis, arrived. Had there been a train that evening to town, he would have taken it and brought his friend down; and if there had been a hotel in the village, he would have left the house forthwith. But there was no train and there was no hotel—not even a beer-shop, for the country folk thereabout moctly brewed their own ale. There was, however, a post and telegraph office in the village, and Hollis was despatched with a message for Willis, entreating him, for his sister's sake, to come down by the train on the following morning. That done,

he endeavoured to compose himself and to take a calm survey of his position. He had upset everybody, and most of all himself, by his good-natured anxiety to save others from the consequences of their own folly. The thing ought to have resulted in a laugh and a shake-hands all round; but instead of that, it threatened to become a serious affair for the law-courts to deal with; and the Major had no means to enable him to indulge in the luxury of a lawsuit.

What was he to do? Nothing but what he had determined upon—to get Willis to speak out, since John Elliott would not. There was of course the possibility that Willis would refuse, as it was his intense repugnance to interfering with family squabbles which had prompted him to call for the Major's assistance as mediator between his sister and her husband.

Major Dawkins felt indignant with John Elliott for shrinking from speaking the few words which would have put everything right. But the truth flashed upon him—perhaps the man was so blinded by his jealousy, that he really did not understand what was required of him, when asked to explain the position. Although the Major could only surmise that this was the case, this surmise was correct; but the true reason why John Elliott did not understand him was that he had no idea of his conversation with Willis having been repeated to any one. If that were so, the Major felt that it was his duty to prevent the threatened publicity by every means in his power. Apart from his consideration for the feelings of Mrs John and Nellie, there was his own plight to be taken into account. Publicity would expose him to ridicule, if not contempt, and would inevitably put an end to all hope of winning the hand of Miss Euphemia Panton. He resolved to see the Squire the moment dinner was over, and make another effort to get him to understand the real state of the unfortunate business.

Servants have a special instinct for discovering the ill-luck of the family they serve, and invariably they accept it in a distorted form. Then they sympathise with the master and mistress, or rejoice in their fallen state, according to the perquisites which have been allowed them or withheld from them. Hollis having heard that his master was in disgrace with the family they had come to visit, felt that his own dignity was at stake; therefore, in the housekeeper's room and in the butler's pantry he valiantly defended the honour of his chief. He was a little crest-fallen when he found that his master was not to join the family at dinner, for this circumstance appeared to confirm the gossip of the servants' hall that the Major had been guilty of some grave offence, the nature of which was too dreadful to be mentioned. Hollis was equal to the occasion, and by taking the position as one of great injustice to his master, succeeded, by cautious suggestions of forthcoming revelations, in impressing the housekeeper and butler with the idea that they would reap a large reward in this future by careful attention to the Major's present needs. The diplomacy of Hollis was used as much on his own account as on that of his master; for he managed to secure command

of the dishes which were most favoured by the Major—and himself, as well as a sufficient supply of Clos de Vongot and Heidsieck.

The Major was scarcely sufficiently appreciative of the attentions of his servant in catering for him so far as the eatables were concerned; and he sadly disappointed Hollis by taking a larger share of the wine than that gentleman had expected. For this loss, however, he contrived to compensate himself when he got downstairs again. Major Dawkins was too eager for the moment when he should be able to speak freely to the Squire to find any delight in eating; and although he took the wine, it was without any of the relish with which he usually partook of rare vintages. When Hollis had cleared the table, he rose immediately, disregarding his digestion, and paced the room. He knew that the dinner would be a more lugubrious affair than the luncheon had been, and he endeavoured to calculate exactly when it would be over.

The time having arrived, he opened his door, which was nearly opposite that of the library. To the latter he advanced quickly, knowing that the Squire frequently went thither after dinner to examine letters or to take a nap. He heard some one moving in the room, and tapped at the door. There was no answer. He tapped again, and still receiving no answer, boldly turned the handle and entered. There was no one visible. He was puzzled, for there had been unmistakable sounds of some one moving about and also of the shutting of a drawer. The window which opened on the terrace was slightly ajar, and possibly the Squire, suspecting who was his visitor, had stepped out in order to avoid him. That was both unfriendly and unjust.

The Major was angry, for he could not conceive any reason for being avoided in this manner. He looked out: no one was visible on the terrace. Then a sudden temptation seized him. He knew exactly in which drawer the Squire had placed those abominable letters. They were his own—why should he not take possession of them and destroy them? In this way the whole miserable business would be ended. Of course, he could not deny having written such letters as would be described, but they would not be forthcoming; and if it should come to the worst, his explanation of the circumstances under which they had been written would be listened to with the more patience and consideration.

The temptation was too much for him. For the sake of the family as well as for his own sake, those letters must be destroyed. He went to the drawer, pulled it open, and there before him lay the letters. He snatched them out and thrust them into the breast-pocket of his coat, with the intention of burning them when he reached his own room; but at that moment his wrists were tightly grasped and he heard the click of handcuffs fastened upon them. He was helpless and speechless. He stood staring at the smiling face of a broad-shouldered fellow who wore the costume of a gamekeeper.

'Got you at last,' said this gentleman quite pleasantly. 'You have given me no end of trouble; but, there, I respect you all the more. Only, you have been coming it rather strong, and I am surprised that you didn't take

a rest, seeing that you've had the valuables out of half-a-dozen mansions in the county.'

'What do you mean?' shouted the Major furiously.

'Nothing particular,' replied the complacent gentleman, 'unless you count it particular that I should want you to come along with me. I am a constable, and I have been looking out for you for some weeks past. So, you had better make no fuss about the matter, but come along quietly. It'll be all the better for yourself.'

'You confounded fool!' ejaculated the Major indignantly, 'do you take me for a burglar? I am a guest in this house—I am Major Dawkins.'

'Alias Captain Jack, alias 'Arry Smith.'

'Call the family—they will identify me,' the Major almost shrieked, whilst he endeavoured to free himself from his handcuffs.

'Oh, I'll call the family,' answered the detective, as he lifted up a jemmy which was lying beside the Squire's desk. 'I suppose you don't know what this little tool means, and I suppose you don't know anything about this drawer which has been forced open with it?'

'You scoundrel, to suspect me of such!—'

'There now; don't say anything to commit yourself; I'll call the family.'

Thereupon, the detective rang the bell.

The summons was answered by Parker the butler, who was somewhat astonished to find a stranger in the library with the Major. The latter's face—purple with rage—and wild gesticulations, with his fettered hands, presented a spectacle so astounding that Parker could scarcely believe his eyes rested on a guest of the house.

'Tell your master to come here and release me from this ruffian, who takes me—me, Major Dawkins—for a burglar!'

The detective smiled placidly as he addressed the butler: 'Yes, if you please, inform Mr Elliott that he is wanted here on particular business.'

ENGLISH COUNSEL AND SOLICITORS.

BY A BARRISTER.

SOME time ago, an agitation sprang up in favour of the amalgamation of the two legal professions in England, and the conduct thereafter of litigious business on lines more or less nearly approximating to the American system. The movement emanated, no doubt, from the town branch of the profession; for it is no secret that many solicitors are anxious to distinguish themselves in court by pleading their clients' causes, in place of retaining counsel to do so for them. But, in the face of more burning questions, the agitation gradually died away.

It now seems not unlikely to be revived, as it is certain that sooner or later it must be. And an *ex cathedra* utterance given by that eminently practical judge, Mr Justice Stephen, a short time ago, will tend to hasten the course of events in this matter. A case for trial before that judge was duly called on, when it was found that the plaintiff was unrepresented, his counsel being at the time engaged in another court. The plaintiff being unwilling, or at least

unprepared, to conduct his own case—notwithstanding the growing tendency in favour of personally conducted cases—the judge was asked to allow the case to stand over, which he did, but not without giving a hint as to the possibility of future ‘reform.’ ‘If,’ said his lordship, ‘such an incident occurs often, it will become necessary to do away with the separation between solicitors and barristers.’ Just so. This is the way the question is regarded from the judicial point of view. When the judge is put to inconvenience, he speaks out; and if he is at all often put to inconvenience, he will act also. But inasmuch as, in most actions, each party is represented by more than one counsel—certainly no ‘distinguished’ or fashionable counsel will accept a brief without a junior—such inconvenience to a judge is of comparatively unfrequent occurrence; so that, although one of its members may occasionally be found to *speak* in favour of amalgamation, little or no active assistance can be expected from the judicial body.

But how does the question affect other interests? Solicitors, as we have hinted, are in favour of amalgamation. It can hardly do them much harm, but must in many cases add to their professional incomes, which is of course all that, as a body, they want. Barristers are more opposed to it, but, we think, without much reason. A few, doubtless, will suffer; but the state of the advocate’s profession as a whole can hardly be worse than it is at present. There are barristers, it may be said, who earn fifteen or twenty thousand pounds a year; but they are not many—ininitely fewer in number than those who earn nothing at all—and they are probably well above the reach of competition, partly by reason of their known and exceptional ability, and partly because they have been placed by fashion on a pedestal which is too firm to crumble away, at least during their brief span of life. But the few who make such incomes may be compared to the large landowners whom Mr Henry George and his friends would rob to enrich (?) those who have no land. If all the incomes made at the Bar were added together, and their sum divided amongst all the barristers, each would have but a pittance, so overstocked is the profession. Hence, regarding barristers as forming a small community, and giving due consideration to the greatest happiness of the greatest number principle, it is pretty obvious that the Bar has really little to lose by the bringing about of amalgamation.

Now from the point of view of the public. It is clear that this largest interest must benefit by amalgamation. It would promote economy—an extremely great gain. It would practically mean the abolition of that middle-man who is so obnoxious to economists, so hurtful to the proper expression of delicate points, and so wasteful of time. It matters not to the public, as long as it is placed in direct communication with its counsel, whether that counsel be a solicitor or a barrister; but it is of great and increasing importance to the vast body of litigants that personal relations should be established between client and advocate; and this is what must sooner or later come to pass. Other advantages of the amalgamated system have been before urged here and else-

where; they need not be again specified in detail. Technically, the probable effect of the system would be the immediate entering into partnership of counsel and solicitors; which would mean nothing to the general public except the nearer approach of counsel and the vastly increased possibility of personal interview with him. Solicitors, in fact, would for all practical purposes become barristers’ confidential clerks; they would do all the work they do now for settlement by their partner counsel; they would receive clients in chambers while their partners were engaged in court, and, in the event of an unusual press of court-work, would conduct the minor cases through their trials. The aggregate advantages of such a reform are so obvious, that minor interests should not be considered in bringing it about; and we are therefore inclined to express a hope that Mr Justice Stephen’s criticism of the existing state of affairs may prove to be prophetic of the near future.

LADY FREDERICK’S DIAMONDS.

I, ARNOLD BLAKE, have had a queer up-and-down, checkered sort of life, and until I was nearing my fortieth year, was most persistently down in my luck. First, it was in Mexico that I tried my fortune, and failed. Then, tempted by an enthusiastic friend, I went to Genoa and set up there in partnership with him as a merchant. The life was a very healthy and happy one, but not what any one could call profitable, from a pecuniary point of view—in fact, quite the reverse. After a few years, finding it impossible, with both ends stretched to the uttermost, to make them meet, we gave that up; and I moved on to Nice, where I had two or three substantial friends. There, things took a turn for the better, and I gradually formed a niche for myself, in time becoming quite an authority in my own small circle. Then, acting on good advice, I started a branch bank in connection with a well-known one in London. This answered fairly well; I had just as much work as I cared to do, was able to pay my expenses, and had even begun to lay by a little hoard against the proverbial ‘rainy-day.’ Nice was a gay, bright town to live in, and I constantly met old friends, and made many pleasant new ones, who were passing through to the South, or spending two or three months there, or at Monte Carlo, for the fascinating pleasure of either losing their own money, or making a tidy little fortune out of somebody else’s pocket.

One afternoon, I was sitting in my small counting-house, writing for the English mail, when the door opened, and in came an old acquaintance, Sir Frederick O’Connor, with a parcel in his hand. ‘How d’ye do, Blake?’ said he cheerily. ‘I’ve come to you to get me out of a difficulty. These are my wife’s jewels. Why she has brought them with her, family diamonds and all, passes my understanding. I call it insane! Fact is I don’t relish the idea of waking up some fine morning to find my throat cut! I want to know if you will be so good as to keep them in your safe while we are here. Whenever Lady O’Connor wishes to dazzle her friends with them, I can easily come round and ask you for what she wants.’

Naturally, I willingly consented to find a corner for the jewels; and after I had taken an inventory of them, Sir Frederick himself placed them in an inner compartment, and I locked the door. I little thought what a dance those confounded diamonds should lead me!

A few days after this, at a large garden-party I met Lady O'Connor, young, pretty, and happy-looking. She shook hands cordially, expressed pleasure at meeting again, and asked if I thought the season would be a gay one. 'By-the-by,' she said, 'it is very kind of you, Mr. Blake, to take care of my valuables. Sir Frederick was quite in despair about them, until a happy thought suggested you as their protector. I am going to trouble you for some of them to-morrow. Fred will call for them; and do not be surprised if you see him bristling with bowie-knives and revolvers, for he has a fixed idea that the Nice ruffian has a keener nose for other people's property than any other ruffian in the world.'

I answered that her lovely jewels were worthy of an escort armed to the teeth, and that I was very glad indeed to be of use to Sir Frederick and herself in any way.

The morning after this garden-party—it must have been about half-past four or five—my sleepy senses were completely scattered by my door being thrown violently open, and Roscoe, my combined valet and commissionaire, a quiet and respectful treasure, landing beside me as if shot out of a catapult. I knew at once that something very dreadful must have happened. Roscoe's face of horror and despair would have made a valuable study for an artist.

'Get up, sir, at once, and come down to the office. The safe has been broken open, and cleaned out, sir, quite empty!' gasped Roscoe breathlessly, pale with excitement.

I cannot recollect what followed during the few minutes in which I hurriedly dressed, and Roscoe is far too considerate to have ever reminded me of that short scene. The first thing I do remember is, finding myself in my office, clothed in a sketchy and uncomfortable manner, the victim of one of the most audacious burglaries that had taken place in Nice for a very long time. I stood gazing at my ransacked safe and rummaged drawers, and at the floor, strewn with papers, among which, here and there, I noticed a few gold pieces, which seemed as if the robbers had been interrupted or startled in some way or other. I was afraid to move from the spot on which I stood until the detective, whom I had sent Roscoe off in a *fiacre* to fetch, should arrive, lest I might unwittingly destroy some small but important piece of evidence, which his experienced eyes would discover at a glance. In a very short time he appeared, and after a friendly word or two, commenced his investigations. He carefully examined the safe, the window, and the door. Nothing seemed to escape him. He took voluminous notes; measured a footmark which he discovered on the floor; but the footmark on further inquiry was found to be his own, which rather put him out.

I told him of the jewels which had been placed in my care so lately.

'Your man informed me, monsieur, as we

came, that you had diamonds of great value in your iron safe.'

A clammy dew broke out suddenly on my forehead, as I remembered that Lady O'Connor was counting on appearing in those same jewels at the prefecture ball that night.

'On the strength of what your servant told me, monsieur,' continued the detective, 'I have already telegraphed to Marseilles, Genoa, and Turin, and have directed some of my most trustworthy men to be on the alert at the railway station and the port. I will send and let monsieur know the moment we get any trace of the stolen property.'

I made out a careful list of all I had lost, gave it to the detective, and then returned to my rooms to dress in a rather less superficial manner. The awful business of breaching the loss of the jewels to Sir Frederick and Lady O'Connor was now staring me in the face, and as I walked to their hotel I became a prey to the most paralysing nervousness I hope it will ever be my lot to endure. I was shown into a charming sitting-room, facing the sea, and though I did not look at anything round me, except the two people I had come to see, I remembered afterwards every detail of the scene.

They were at breakfast. The refreshing, sun-warmed morning air breathed softly in through the open window, scented by the mignonette, which grew thickly in boxes on the balcony outside. Lady O'Connor looked very graceful and pretty in a long loose gown of some soft Indian silk, trimmed with lace. Sir Frederick, also in comfortable unconventional garments, was reading aloud a letter, over which they were both laughing merrily as I was announced. They welcomed me warmly, looking as if early and unexpected visitors were quite a common occurrence, and between them, carried on the usual preliminary chit-chat about the lovely weather, the delight of being able to breakfast with the window open in the month of November, the view, &c., as long as the servant remained in the room, while I stood looking from one to the other, solemnly bowing my head in silent answer to their cheerful remarks. It is not necessary to relate what passed; suffice it to say that both Sir Frederick and Lady O'Connor possessed an unusual share of kindness of heart and of sympathy with other people's misfortunes, and they endeavoured to make my unpleasant position as easy for me as possible.

Then followed a week of restless activity. I haunted the police bureau; if I was not there two or three times a day myself, I sent Roscoe to find out for me if any telegrams had arrived on the all-important subject, any clue been found to throw the smallest light upon it.

One lovely afternoon, I was walking down the Promenade des Anglais in anything but a cheerful frame of mind, indeed I do not think I ever felt so utterly depressed before. Nothing whatever had been heard of the missing jewels; and during a long consultation that morning with Aiguenez the detective, he had told me that he firmly believed that the robbery was the work of one man, and that the jewels were still in Nice. I had been calling at one of the pretty villas beyond the Var,

and was now making my way down the side of the Promenade next the houses, to the *Hôtel de la Méditerranée*, to talk over Aiguanez's last suggestion with Sir Frederick O'Connor. As I was passing the high solid walls of the now quite unused cemetery, I noticed that the door was ajar; and expecting to find there old Baroni the care-taker, whom I knew, I pushed open the door and entered. Nobody was there: all was silent and solitary. Here and there were untidy heaps of rubbish; tangled, overgrown hushes; and propped against the walls were two or three gravestones that had covered graves from which the remains had been removed to some family vault elsewhere. I could not help wondering how much Baroni received for the amount of care and labour he bestowed on the old English burial-ground. When my eyes, which were uncommonly sharp ones, had become accustomed to the dark shadows thrown by the walls, and the brilliant glare where the shadow-line ended, I noticed that a gravestone lying in rather a retired spot appeared, by the fresh-looking footmarks round it, to have been lately moved. I do not think that this circumstance would have roused my curiosity in the then preoccupied state of my mind, had it not been that close beside it a large branch of a neighbouring tree had been bent down and fastened firmly to the ground by means of a stone. This arrested my attention, it was so evidently intended to mark the spot. Exerting all my strength, I pushed the heavy stone sufficiently to one side to enable me to see that it concealed a small pit, recently dug, by the look of the mould round it. It was empty! I managed to replace the gravestone, and left the cemetery, carefully closing the door behind me, and glancing round to see if my actions had been observed.

I hurried on to the hotel, wondering and conjecturing as to the possible meaning of the curious little mystery I had just discovered. That small oblong pit, for what purpose could it have been prepared? My first idea was that a murder had been or was about to be committed, and in this way it was intended to get rid of the victim's body; but the hole was certainly not large enough for a grown person. Was it possible that it was to be the unblest, unadorned tomb of some little one, done to death by pitiless earthly guardians, who found its frail helpless life a burden to them? That was too hideous a fancy. Suddenly, the thought struck me that it might be a hiding-place for property! By Jove, the diamonds!

At that moment I reached the *Méditerranée*, and going up the broad stairs three at a time in my excitement, I knocked at the door of the O'Connors' sitting-room. Sir Frederick was alone, smoking, with the last number of the *World* in his hand.

'I felt sure that you would come in this afternoon,' he said, as he pushed his cigar case towards me, 'so I put off going to the club.—What is the latest intelligence?'

I first told him of Aiguanez's opinion, that the jewels were still in Nice, an opinion which had now gained for me a double significance. Then I unfolded my own budget, and told him of all I had seen in the old cemetery which had been closed for so many years.

This put Sir Frederick into the wildest spirits. 'We've got them now, Blake!' he exclaimed, 'and no mistake about it. They've run themselves into a nice trap. Of course, these are the rascals we're after.—What do you say?—Don't set my heart upon it, in case of disappointment. Nonsense! my dear fellow. Don't you see they cannot get rid of diamonds like those in a hurry; and not being able to leave the town puts them in a regular fix? It is very dangerous for them to keep such valuable things about them, and now, they flatter themselves that they have found an uncommonly safe hiding-place. Why, Fate must have led you by the very nose to that door this afternoon!'

I laughed. 'It is as well for us, perhaps, that I did not feel her fingers, or things might have turned out differently. We had better settle our plan of action for to-night, as it won't do to let this chance slip. How fortunate there is no moon. It will be as black as Erebus inside those high walls.'

'Our best plan,' said Sir Frederick, 'is, I think, to hide ourselves there as soon as it is dark. We may have a long time to wait; but then, again, we may not, and we are much less likely to be observed if we slip in early in the evening.'

'Then I will call for you, Sir Frederick, as soon as it is dark enough,' I answered. 'And allow me to suggest that we do not take Aiguanez into our confidence, for it will be a triumph indeed to ent on the far-famed French detective in his own line of business.'

I left the hotel with a lighter heart than I had carried about with me for some time. Though I had cautioned Sir Frederick not to be too sanguine, I was myself convinced that we should have the diamonds in our possession before morning. I went back to my rooms, wrote some letters, dined, and then tried to quiet my excited mind by pacing up and down the sitting-room, smoking my usual post-prandial cigar, till I thought it was sufficiently dark to venture forth. The church clocks were striking ten as I arrived at the *Méditerranée Hotel*, and I found Sir Frederick performing the same restless quarter-deck constitutional on the pavement outside.

'So glad you've come, Blake; I'm anxious to be off now.—What is that in your hand?'

'A small lantern,' I answered. 'We shall find it useful.'

'Got a revolver?' inquired Sir Frederick in a solemn whisper.

'No,' said I, in an equally sepulchral voice; 'fists are my weapons.'

'Pooh!' returned he. 'Of what use are English fists when you have an Italian knife in your ribs?—Here we are!'

The door was exactly as I had left it. There was not a sign of anybody near us, so we went quickly through, closing it again behind us. We stood for a minute silent and still, until our eyes had become more accustomed to the intense darkness round us; then we groped our way, with two or three stumbles against tombstones and over mounds of earth, to the spot where I fancied the marked stone must be, and in a few seconds I discovered it without doubt, by falling over it. As I was collecting myself and my scattered senses together again, after this sudden and

unpleasant downfall, I heard close beside me a volley of muttered execrations from Sir Frederick, who declared, in an agitated whisper, that he was sure he had caught a ghost or something very like it. At the risk of discovery, I opened the lantern, and for one second threw the light on the object he held in his hands. It was an unusually large bat, which, disturbed by our intrusion on its own domain, must have flown or dropped on to Sir Frederick from the tree under which he was standing. He quickly shook it off; and without further adventure we concealed ourselves in some thick bushes near the grave. It would have required the eyes of a lynx to discover us, hidden as we were in the midst of a mass of evergreen, overgrown with a network of tangled creepers, and the high black wall behind. There we waited, keenly watchful. Not a leaf stirred. A perfectly dead silence lay over everything, as if the fairy of the Sleeping Beauty story of our childhood held nature bound under her spell. A mouldy, damp, earthy vapour rose from the ground at my feet, and seemed to weigh me down as if it were something solid.

The clock of Notre-Dame struck eleven. Another long weary hour went slowly by, and then the clock struck midnight. I believe I had sunk into a sort of doze, when every faculty was suddenly roused by hearing a soft movement at the door, which was very gently opened. There was a pause, as if the new-comers were listening; the door was shut, and a lantern shed its narrow streak of light over the graves at their feet. One, two, three dark forms, two of whom carried between them what seemed to be a box. Sir Frederick gently nudged me—of course that contained the jewels. They came quietly to the side of the mysterious tombstone, and, setting their burden down on another one close by, they set to work, and quickly moved it to one side. I then discovered, to my surprise, that the one that held the lantern was a woman. Their faces were deep in shadow; I did not once get a glimpse of their features. All their movements were quiet and free from haste; they evidently had not the smallest notion that discovery was possible. The two men carefully laid the box in the hole prepared for it, covered it with mould, and, after replacing the stone stretched themselves, and held the lantern aloft, the better to survey their handiwork. It seemed very satisfactory to their female companion, for I distinctly heard her breathe a sigh of unmistakable relief. They left the place as quietly as they had come to it, not having, as far as we knew, spoken a word to each other the whole time.

It was our turn now. As soon as we were quite sure that we again had this dismal solitude to ourselves, we emerged from our damp hiding-place and shook ourselves into shape, for naturally we both felt very stiff and numb after our long weird vigil. I opened my lantern, and we began eagerly to undo the work we had just seen so neatly accomplished. It did not take long to remove the stone and scatter the thin layer of mould. In a few minutes we had the box—a boy's oblong deal play-box, clamped with iron—lying on a tombstone before us.

'Open it, Blake,' said Sir Frederick.
'Locked,' I answered as I shook the lid.

'Take my knife,' continued the baronet, as he drew from his pocket one of the formidable weapons at which his wife had laughed.

It was a common lock, and easily forced. As I threw back the lid, Sir Frederick held up the lantern: 'Take them out, Blake, and see if they are all there; it will be a wonderful thing if none are missing.—What on earth is that?'

'It looks to me like a dog-collar,' I answered, as I shook out a black Cashmere shawl in which was wrapped a silver curb chain with a small silver bell attached to it.

'Stolen from somebody else,' cried Sir Frederick. 'Get on with the rest.'

'This beats everything,' said I, and drew forth a small pale-blue garment fashioned like a horse's body-cloth, with a monogram in gold thread at one side. 'It is a dog's coat.—And what the deuce is this?'

'A dog!' we exclaimed simultaneously.

Carefully folded in a piece of soft linen lay the body of a small silky white, long-haired terrier—to judge by all its surroundings, a lady's cherished pet. For a few seconds, disgust and disappointment kept us silent; then Sir Frederick broke out into a series of execrations more amusing than effective.

We had been befooled by our own enthusiasm as amateur detectives, and at first were angry, but by-and-by came to see the situation in its more grotesque aspect. After giving vent to our feelings in a burst of suppressed laughter, we put the little pet back into his play-box coffin, being careful to see that everything was just as we had found it; and quickly shovelling the mould and pushing the tombstone over it, we crept out of the old cemetery. Our feelings were very different from those with which we had entered it. We were greatly cheered, however, on reaching the hotel to find a line from Aiguinez, which had come during Sir Frederick's absence: 'I am on the right track.'

We heard no more for two days, when the detective reappeared with a captive, a valet whom Sir Frederick had dismissed before leaving England, who, knowing the great value of the jewels which Lady O'Connor was taking with her, had thought it worth his while to follow them, and being a clever hand at that sort of work, had succeeded as we have seen.

OCCASIONAL NOTES.

THE WEST AUSTRALIAN GOLD-FIELDS.

FOR some years, the government of Western Australia has offered a reward of five thousand pounds for the discovery of a payable gold-field within three hundred miles of a declared port. From recent news from Perth, it would almost appear that a profitable gold-field has at last been discovered. We learn that Messrs Malet and McEwen, who were sent by the government to explore the Kimberley District, in the extreme north of the colony, have returned, after an expedition which nearly proved disastrous to the explorers. They lost their horses; and having consumed all their provisions, only escaped starvation by coming unexpectedly to a settler's hut, where they obtained assistance. The party arrived barefooted, their boots having fallen to

pieces on the tramp of one hundred miles. Mr McEwen nearly succumbed to the hardships of the journey. A quantity of the new gold has already found its way to England. According to advices from Derby, the port of the country—named after the present Lord Derby, and situated at the head of King's Sound—large numbers of people, who were totally unfitted for the work, were starting for the Kimberley gold-fields. As the roads are rough, and provisions scarce and dear, with an absence of water, it goes without saying that no one need venture in search of wealth without being supplied with plenty of money and an ample supply of provisions. The country is described as closely resembling the Peak Down District in Queensland. The gold is much scattered, but the gullies are numerous. It is expected that so soon as the alluvial gold is worked out, productive reefs will be laid bare. The Kimberley District, contrary to what many have supposed, is a country about four and a half times the size of Scotland, with splendid rivers, and with millions of acres of pastoral and agricultural land. The climate has been commended by Captain Grey and other explorers as one of the finest and healthiest in the tropics. Last year, the population numbered only about one hundred white men; the blacks, who are not numerous, are tractable. Sheep, cattle, and horses thrive well, so that, whether or not the gold-fields fulfil the expectations of those who seek their fortune at the gold-fields, there is a fine country to develop. Derby, the capital of this district, at the mouth of the Fitzroy River, consisted lately of but a few huts and tents, and is the station of a government resident. Should the 'rush' to the gold-fields continue, doubtless all this will soon be changed.

ROYAL VETERINARY COLLEGE.

The horse fills so large a place in human affairs, that a few words descriptive of an institution devoted to its welfare must interest more or less every one. The Royal Veterinary College—situated in Great College Street, Camden Town, London, N.W.—discharges the twofold function of a hospital and a school; that is to say, it is there the sick or maimed horse—or for the matter of that, the sick or maimed sheep, ox, dog, &c.—is taken to be doctored; and it is there the young man goes for the education and diploma which are to qualify him for the vocation of a veterinary surgeon. The scope of the present series of papers, however, only justifies our considering the institution in its curative capacity. Horse-owners, then, come, in relation to the College, under two heads—subscribers and non-subscribers. If elected by the Governing Body, or General Purposes Committee, a person becomes a yearly subscriber by paying two guineas per annum; or a life subscriber either by paying twenty guineas in one sum, or sixteen guineas after making the annual payment for not less than two consecutive years—certain exceptional conditions applying to firms and companies. The privileges of a subscriber are—(1) To have the gratuitous opinion of the professor as to the treatment to be applied to any animal of his brought for the purpose to the College, but which he may desire to retain in his own keeping. (2) To have admitted into the

infirmary, for medical and surgical treatment, any number of his own horses and other animals for which there may be room, at a charge only for their 'keep.' (3) To have in the course of any year five horses, his actually or prospective property, examined gratuitously as to soundness, either before or after purchase; and to have any further number examined at a fee of ten shillings and sixpence per head. (4) To be supplied with medicines for animals at a fixed charge. (5) To have, at a fixed rate, a chemical analysis made by the Professor of Chemistry at the College of any water, provender, oilcake, or other feeding-matter, and of the viscera of any animal suspected of being poisoned. (6) In cases of extensive or serious outbreaks of disease, to have an investigation made into its nature and causes, on payment of the fixed charges. And (7) To have a post-mortem examination of any animal, or parts of an animal, sent to the College, and receive an opinion of the probable cause of death, on payment of a fixed charge. As regards outsiders or non-subscribers, the treatment and examination of their animals by the staff of the College are subject to a higher tariff of charges. Another disability under which they labour is that their animals may not be received into the infirmary for treatment. 'Accidents' and other urgent cases are received into the institution at all times of the day and night, special vehicles being kept at hand for their transportation.

A singular by-law of the College is the following: 'Credit will be given for all animals which may die in the infirmary according to the amount received for the carcass; but all diseased parts shall be considered to be the property of the College.' Such 'diseased parts' are useful vehicles in the dissecting-room for conveying knowledge to the minds of the students.

A SONG OF REST.

O WEARY Hands! that, all the day,
Were set to labour hard and long,
Now softly fall the shadows gray,
The bells are rung for evensong.
An hour ago, the golden sun
Sank slowly down into the west;
Poor, weary Hands, your toil is done;
'Tis time for rest!—'tis time for rest!

O weary Feet! that many a mile
Have trudged along a stony way,
At last ye reach the trusting stile;
No longer fear to go astray.
The gently bending, rustling trees
Rock the young birds within the nest,
And softly sings the quiet breeze:
'Tis time for rest!—'tis time for rest!

O weary Eyes! from which the tears
Fell many a time like thunder-rain—
O weary Heart! that through the years
Beat with such hither, restless pain,
To-night forget the stormy strife,
And know, what Heaven shall send is best;
Lay down the tangled web of life;
'Tis time for rest!—'tis time for rest!

OUR WAYS AND THEIRS.

To do at Rome as the Romans do is sage advice, not always nor often followed by those of us who wander afield. Voluntarily placing ourselves among people whose ways and habits are different from our own, and whose principles of action are as sacred to them as ours are to us, we 'fling our five fingers' in the face of rules and regulations which are to them the very sign and substance of social decorum. Principles which are stricter than our own we call prejudices; and pool-pool as valueless those virtues in which we are wanting, while condemning as unpardonably immoral everything whatever which is of laxer fibre and looser holding than the corresponding circumstance at home. Thus, we fall foul of the southern nations for their want of straightforwardness, their sweet deceptive flatteries, their small short-sighted dishonesties; yet we count it but a little matter that they should be sober, abstemious, kind-hearted, and charitable; that they should not beat their children nor kick their wives to death; nor spend on one gross meal of beef and beer half the earnings of the week. We forget, too, that if we are 'done' in the vineyards and the orange groves, others are as much 'done' in the hop gardens and the hay-fields; and that: 'Here is a stranger—come, let us rob him,' is the rule of life all the world over. We deride the costly political efforts made by young nations struggling to obtain a place in European councils; but we have not a word of praise for the patience with which the people bear their heavy burden of taxation, that their country may be great with the great, and strong with the strong. In short, we find more barren land than fertile, all the way from Dan to Beersheba; and, once across the silver streak, very few points, if any, attract our admiration, while fewer still compel our adhesion.

One of the most striking acts of unconformity lies in the charter of liberty given to our girls, compared with the close guard enforced among the bold wooers and jealous possessors of the fervid

south. An amount of freedom, which is both innocent and recognised here, is held as dangerous and improper there; but few English girls will submit to more personal restraint in Palermo or Madrid than that to which they have been accustomed in Cornwall or Cumberland. And indeed, they often launch out into strange license, and do things in foreign cities which they would not dare to do in their own native towns. They think they are not known; and what does it signify what people say of them?—the honour of the English name not counting. If you reason with them, and tell them that such and such things are ill thought of by the natives, they look at you blankly and answer: 'What does it matter to us? Their ways are not ours, thank goodness! and we prefer our own. Besides, they must be very horrid people to think evil when there is none.' Mothers and chaperons are no more sensitive, no more conformable, than their charges, and quite as resolute to reject any new view and trample under foot any rule of life to which they have not been accustomed. Tell one of them that, in a purely foreign hotel, the girl must not be let to sleep in another corridor—on another floor—or away from her own immediate vicinity, and she asks: 'Why? My daughter is not a baby; she can take care of herself. And what harm should happen to her?' Tell her that the girl must not wander unaccompanied about the passages, the gardens, the public rooms of the hotel, nor sit apart in corners of the salon talking in whispers with the men, nor lounge on the benches with one favoured individual alone—and she scouts all these precautions as foolish if not insulting. Say that it is not considered correct for the young lady to come to table-d'hôte by herself at any time of the meal it may suit her to appear—perhaps dashing into dinner in her hat, breathless, heated, excited—and again the advice is rejected. Her daughter has been accustomed to be mistress of her own time as well as actions, and lawn-tennis is a game which cannot be interrupted nor determined by one person only. She did just the same last year at Scarborough, and no one made

unpleasant observations; so, why should she be under more control now? Yes, she did all these things at home, where they are compatible with 'well-and-wise-walking.' But in a foreign hotel, tenanted by men who respect young women only in proportion to the care that is taken of them, they are not well nor wise; nay, more, they are looked on as criminal acts of neglect in those who have the guidance of things.

Manners are special to countries as to classes, and are accepted as so much current coin, which passes here, but would not run out of the limits of the realm. Jerminer, down at Margate, giggles back to 'Arry, making lollipop eyes at her over the old boat, while sucking the knob of his sixpenny cane. From giggling and making lollipop eyes, the pair soon come to speech; from speech to association; from association to love-making in earnest, and mayhap to marriage. In any case, no harm is done; and Jerminer and 'Arry are as little out of the right course, judged from their own stand-point, when they make acquaintance in this primitive manner, as is Lady Clara Vere de Vere when she is whirled away in Lord Verisopht's arms on a first introduction. The coin is good where it is minted. But Lady Clara Vere de Vere would be but base metal at Tangier and Tunis; and Jerminer is not understood, say at Palermo, when she comes there in force, trailing her Margate manners at her heels. Consequently, when three pretty girls alight at that fair city, and 'carry on' as if they were in 'appy 'Ampton, they naturally excite some attention, not of a flattering kind, among people to whom girlhood is at once brittle ware and a sacred deposit. A showy triad, dressed in the fluttering fashion dear to the tribe of Jerminer—bows here, ends there—colours which dazzle, and shapes not to be overlooked—they make themselves still more conspicuous by their millinery than nature has already made them by her gift of milkwhite skins and flaxen hair. They make themselves more conspicuous by their manners than by either millinery or colour. They care nothing for sight-seeing, and all for flirting, or what in their vernacular is 'larking.' Like their prototype giggling back to 'Arry over the old boat, they look back and laugh and beckon and nod to the young officers who follow them through the streets, thinking that here is sport made to their hand, and that to reject the roasted larks which fall from the sky would be a folly unworthy a rational human being. From looking they pass into speech; and, by aid of a dictionary and their fingers, make appointments and go off on expeditions, unchaperoned, with these young men, to whom they have no more clue than is given by their uniform and the number of their regiment. When warned by experienced compatriots, they treat the warning as envy of their enjoyment. When advised by the handsome general who takes his own share of the cake, liberally, they treat his

advice as jealousy of the younger men; and so, following their own course, they become the town's talk, the shame of the English colony, the indignation of their hotel companions, and the standing marvel of the whole native population. They put, too, a stone in the hand of the reactionary and exclusive; and: 'See to what your dangerous liberties lead your girls!' is a reproach which no one can ward off. This is an instance of unconformity known to the writer of these lines as having taken place last winter in Palermo.

English and American girls flirt in a way which the fervid south neither permits nor understands. So far that fervid south is more real and more intense than we, who yet pride ourselves on both our sincerity and our depth. A painful little drama took place not long ago, founded on these cross lines of violated custom. Down on the Gulf of Naples a quite young girl, precocious in character and appearance and given up by her mother to the care of her maid, flirted with a young Italian as a foolish child would, given the chance, and only a venal servant to accept bribes for not looking after her. The young fellow took her seriously. When the trying moment came, she opened her large blue eyes and said with the candid air of a cherub: 'I meant nothing but fun. I do not love you, and I am too young to marry.' The youth shot himself as his commentary on her answer.

Again, no kind of warning as to the untrustworthiness of certain plausible scoundrels, known to be mere *cacciatori* or fortune-hunters, will do any good to certain women determined to ruin themselves. A girl not long ago fell in love with a Sicilian scamp of handsome presence and desperate character. In vain her friends warned her of his reputation, and besought her to conquer her suicidal passion—in vain! In vain! She would not, and she did not; but, like the poor foolish moth, flew right up to the candle, and proved too fatally what the flame was like. She married; and then learnt what a torturer and a tyrant could do when put to it. Before the year was out she had to escape by stealth from a man who starved her and beat her; who slept with a revolver under his pillow, with which he threatened her at dead of night—waking her from her sleep to terrify her into almost madness—and who made her regret too bitterly that she had not taken advice when it was given her, and believed in the truer knowledge of the more experienced.

In health it is the same story. We, who go on a visit of a few weeks, know so much better what is good for us than the natives of the place, who have had the experience of a lifetime and the traditions of centuries to guide them! We laugh at their precautions, and refuse to be 'coddled.' Hence, we go straight into the jaws of danger, and then wonder that we are bitten. We hang over the malarial waters stagnating in

the Colosseum, when we go there to 'enthuse' by moonlight. We lie on the rank grass in the Campagna, cooling our flushed faces on the earth which teems with the germs that slay and the emanations that destroy. We whip our blood to fever-heat by violent exertion under the burning sun, then get chilled to the marrow when the great orb sinks to darkness and the cold damps rise like malignant spirits from the tomb; and we think the inhabitants lazy because they take their exercise duncely, and effeminate because they avoid the half-hour of sundown as they would avoid a tiger crouching in the jungle. We eat and drink in feverish Italy and exciting Spain as we eat and drink in damp, depressing England; and we refuse to do at Rome as the Romans do, to the damage of our liver and the ruin of our nerves. We know best—are we not free-born Britons?—and our flag of nonconformity is the sign of our superiority. We despise the religion of the countries we visit, and will not believe that the worshippers of the saints have more respect than have we ourselves for the faith into which they have been born and bred. A friend of our own curries this feeling to its last development, not being able to understand, nor to believe, that the old Greeks and Romans had any respect for Zeus or worship for Minerva. The grandeur and multiplicity of their temples, the magnificence and frequency of their processions, say nothing to him. Their ways are not his, and he cannot accept them as true for them if not for him. All people who have been abroad, and who respect the habits and feelings of those among whom they have placed themselves, know how painful it is to meet certain of their countrymen and women in the churches during service. These nonconformists pay no more respect to the place than if it were a barn cleared out for a play-night. They walk about making comments in audible voices, and stepping over the obstructive feet of the kneeling worshippers as unconcernedly as if they were picking their way among so many bales of cotton and wool. Why should they not? When faith and habits clash, are not our own those which we must consider? At a funeral service in St Rech, when the nave was draped in black and occupied by the mourners gathered round the coffin, there came up the side aisle, arm-in-arm, a young Englishman and, perhaps, his bride, joyous, happy, talking, laughing. What to them, in the flush of their youthful bliss, was the sorrow of the widow, the grief of the children, the loss of a good man and a useful life? They were on one plane, and all these weeping mourners were on another; and their own was predominant.

In a smaller matter than this, we show the same want of conformity. We go to a theatre in full dress where the ladies of the place go in bonnets, and to the opera in ulsters and travel-worn hats where the élite are in their diamonds and plumes. But so it is all through. We are British, and may do as we like, not being slaves nor wearing wooden shoes like those others, and Britannia ruling the seas—a cross between Neptune and Minerva. We eat and drink and dress and flirt and live independent of the rules by which the people of the country are guided and checked. But if any one does not conform to our ways, he is anathematised, and we

wonder how such bad taste is possible with a well-conditioned person! It is the stiff Anglo-Saxon neck, which, were it to bend, would not lose in power, but would gain in grace.

IN ALL SHADES.

CHAPTER XLII.

MARIAN was behind in the dining-room and bedrooms with Aunt Clemmy, helping to nurse and tend the sick and wounded as well as she could, in the midst of so much turmoil and danger. When she and Edward had been roused by the sudden glare of the burning cane-houses, reddening the horizon by Orange Grove, and casting weird and fitful shadows from all the mango-trees in front of their little tangled garden, she had been afraid to remain behind alone at Mulberry, and had preferred facing the mad-dened rioters by her husband's side, to stopping by herself under such circumstances among the unfamiliar black servants in her own house. So they had ridden across hurriedly to the Dupuy's together, especially as Marian was no less timid on Nora's account than on her own; and when they reached the little garden gate that led in by the back path, she had slipped up alone, unperceived by the mob, while Edward went round openly to the front door and tried to appease the angry negroes.

The shouts and yells when she first arrived had proved indeed very frightening and distracting; but after a time, she could guess, from the comparative silence which ensued, that Edward had succeeded in gaining a hearing; and then she and Aunt Clemmy turned with fast beating hearts to look after the bleeding victims, one of whom at least they gave up from the first as quite dead beyond the reach of hope or recovery.

Nora was naturally the first to come to. She had fainted only; and though, in the crush and press, she had been trampled upon and very roughly handled by the barefooted negroes, she had got off, thanks to their shoeless condition, with little worse than a few ugly cuts and bruises. They laid her tenderly on her own bed, and bathed her brows over and over again with Cologne water; till, after a few minutes, she sat up again, pale and deathly to look at, but proud and haughty and defiant as ever, with her eyes burning very brightly, and an angry quiver playing unceasingly about her bloodless lips.

'Is he dead?' she asked calmly—as calmly as if it were the most ordinary question on earth, but yet with a curious tone of suppressed emotion, that even in that terrible moment did not wholly escape Marian's quick womanly observation.

'Your father?' Marian answered, in a low voice.—'Dear, dear, you mustn't excite yourself now. You must be quite quiet, perfectly quiet. You're not well enough to stand any talking or excitement yet. You must wait to hear about it all, darling, until you're a little better.'

Nora's lip curled a trifle as she answered almost disdainfully: 'I'm not going to lie here and let myself be made an invalid of, while those murderers are out yonder still on the piazza.

Let me get up and see what has happened.—No; I didn't mean papa, Marian; I know he's dead; I saw him lying hacked all to pieces outside on the sofa. I meant Mr Noel. Have they killed him? Have they killed him? He's a brave man. Have the wretches killed him?

'We think not,' Marian answered dubiously. 'He's in the next room, and two of the servants are there taking care of him.'

Nora rose from the bed with a sudden bound, and stood, pale and white, all trembling before them. 'What are you skipping there wasting your care upon me for, then?' she asked half angrily. 'You think not—think not, indeed! Is this a time to be thinking and hesitating! Why are you looking after women who go into fainting-fits, like fools, at the wrong moment? I'm ashamed of myself, almost, for giving way visibly before the wretches—for letting them see I was half afraid of them. But I wasn't afraid of them for myself, though—not a bit of it, Marian: it was only for Mr Noel.' She said it after a moment's brief hesitation, but without the faintest touch of girlish timidity or ill-timed reserve. Then she swept queen-like past Marian and Aunt Clemmy, in her white dinner dress—the same dress that she had worn when she was Marian's bridesmaid—and walked quickly but composedly, as if nothing had happened, into the next bedroom.

The two negroes had already taken off Harry's coat and waistcoat, and laid him on the bed with his shirt front all saturated with blood, and his forehead still bleeding violently, in spite of their unskilful efforts to stanch it with a wet towel. When Nora entered, he was lying there, stretched out at full length, speechless and senseless, the blood even then oozing slowly, by intermittent gurgling throbs, from the open gash across his right temple. There was another deeper and even worse wound gurgling similarly upon his left elbow.

'They should have been here,' Nora cried; 'Marian and Clemmy should have been here, instead of looking after me in yonder.—Is he dead, Nita, is he dead? Tell me!'

'No, missy,' the girl answered, passively handing her the soaked towel. 'Him don't dead yet; but him dyin', him dyin'. De blood comin' out ob him, spurt, spurt, spurt, so him can't lib long, not anyway. Him bled to death already, I tinkin', a'most.'

Nora looked at the white face, and a few tears began at last to form slowly in her brimming eyelids. But she brushed them away quickly, before they had time to trickle down her blanched cheek, for her proud West Indian blood was up now, as much as the negroes' had been a few minutes earlier; and she twisted her handkerchief round a pocket pencil so as to form a hasty extemporised tourniquet, which she fastened bravely and resolutely with intuitive skill above the open wound on the left elbow. She had no idea that the little jets in which the blood spurted out so rhythmically were indicative of that most dangerous wound, a severed artery; but she felt instinctively, somehow, that this was the right thing to do, and she did it without flinching, as if she had been used to dealing familiarly with dangerous wounds for half her

lifetime. Then she twisted the hasty instrument tightly round till the artery was securely stopped, and the little jets ceased entirely at each pulsation of the now feeble and weakened heart.

'Run for the doctor, somebody!' she cried eagerly; 'run for the doctor, or he'll die outright before we can get help for him!'

But Nita and Rose, on their knees beside the wounded man, only cowered closer to the bedside, and shook with terror as another cry rose on a sudden from outside from the excited negroes. It was the cry they raised when they found Delgado was really struck dead before their very eyes by the visible and immediate judgment of the Almighty.

Nora looked down at them with profound contempt, and merely said, in her resolute, scornful voice: 'What! afraid even of your own people? Why, I'm not afraid of them; I, who am a white woman, and whom they'd murder now and hack to pieces, as soon as they'd look at me, if once they could catch me, when their blood's up!—Marian, Marian! you're a white woman; will you come with me?'

Marian trembled a little—she wasn't upheld through that terrible scene by the ingrained hereditary pride of a superior race before the blind wrath of the inferior, bequeathed to Nora by her slave-owning ancestors; but she answered with hardly a moment's hesitation: 'Yes, Nora. If you wish it, I'll go with you.'

There is something in these conflicts of race with race which raises the women of the higher blood for the time being into something braver and stronger than women. In England, Marian would never have dared to go out alone in the face of such a raging tumultuous mob, even of white people; but in Trinidad, under the influence of that terrible excitement, she found heart to put on her hat once more, and step forth with Nora under the profound shade of the spreading mango-trees, now heavily lighted up at all at fitful intervals by the dying glow from the burnt-out embers of the smoking cane-houses. They went down groping their way by the garden path, and came out at last upon the main bridle-road at the foot of the garden. There Marian drew back Nora timidly with a hand placed in quick warning upon her white shoulder. 'Stand aside, dear,' she whispered at her ear, pulling her back hastily within the garden gate and under the dark shadow of the big star-apple tree. 'They're coming down—they're coming down! I hear them, I hear them! O God, O God, I shouldn't have come away! They've killed Edward! My darling, my darling! They've killed him—they've killed him!'

'I wouldn't stand aside for myself,' Nora answered half aloud, her eyes flashing proudly even in the shadowy gloom of the garden. 'But to save Mr Noel's life, to save his life, I'll stand aside if you wish, Marian.'

As they drew back into the dark shadow, even Nora trembling and shivering a little at the tramp of so many naked feet, some of the negroes passed close beside them outside the fence on their way down from the piazza, where they had just been electrofied into sudden quietness by the awful sight of Louis Delgado's dead body. They were talking earnestly and low among themselves, not, as before, shrieking and yelling and

gesticulating wildly, but conversing half below their breath in a solemn, mysterious, awe-struck fashion.

'De Lord be praise for Mr Hawthorn!' one of them said as he passed unseen close beside them. 'Him de black man fren'. We got nobody like him. I no would hurt Mr Hawthorn, de blessed man, not for de life ob me.'

Marian's heart beat fast within her, but she said never a word, and only pressed Nora's hand, which she held convulsively within her own, harder and tighter than ever, in her mute suspense and agony.

Presently another group passed close by, and another voice said tremulously: 'Louis Delgado dead—Louis Delgado dead! Mr Hawthorn is wonderful man for true! Who'd have tought it, me brudder, who'd have tought it?'

'That's Martin Luther,' Nora cried almost aloud, unable any longer to restrain her curiosity. 'I know him by his voice. He wouldn't hurt me.—Martin, Martin! what's that you're saying? Has Mr Hawthorn shot Delgado?' As she spoke, with a fierce anticipatory triumph in her voice, she stepped out from the shadow of the gate on to the main bridle-path, in her white dress and with her pale face, clearly visible under the faint moonlight.

Martin flung up his arms like one stabbed to the heart, and shouted wildly: 'De missy, de missy! Dem done killed her on de piazza yonder, and her duppy comin' now already to scare us and trouble us!'

Even in that moment of awe and alarm, Nora laughed a little laugh of haughty contempt for the strong, big-built, hulking negro's superstitious terror. 'Martin!' she cried, darting after him quickly, as he ran away awe-struck, and catching him by the shoulder with her light but palpable human grasp, 'don't you know me? I'm no duppy. It's me myself, Missy Nora, calling you. Here, feel my hand; you see I'm alive still; you see your people haven't killed me yet, even if you've killed your poor old master.—Martin, tell me, what's this you're all saying about Mr Hawthorn having shot Delgado?'

Martin, shaking violently in every limb, turned round and reassured himself slowly that it was really Nora and not her ghost that stood hoddily before him. 'Ha, missy,' he answered good-humouredly, showing his great row of big white teeth, though still quaking visibly with terror, 'don't you be 'fraid; we wouldn't hurt you, not a man of us. But it don't Mr Hawthorn dat shot Delgado! It God Almighty! De Lord hah smitten him!'

'What!' Nora cried in surprise. 'He fell dead! Apoplexy or something, I suppose. The old villain! he deserved it, Martin.—And Mr Hawthorn? How about Mr Hawthorn? Have they hurt him? Have they killed him?'

'Mr Hawthorn up to de house, missy, an' all de niggers pray de Lord for true him fob for eiber, de blessed creature.'

'Why are you all coming away now, then?' Nora asked anxiously. 'Where are you going to?'

'Mr Hawthorn send us home,' Martin answered submissively; 'an' we all 'fraid, if we don't go straight when him tell us, we drop down dead

wit Kora, Datan, an' Ahiram, an' lyin' Ananias, same like Delgado.'

'Marian,' Nora said decisively, 'go back to your husband. You ought to be with him.—Martin, you come along with me, sir. Mr Noel's dying. You've killed him, you people, as you've killed my father. I've got to go and fetch the doctor now to save him; and you've got to come with me and take care of me.'

'Oh, darling,' Marian interrupted nervously, 'you mustn't go alone amongst all these angry, excited negroes with nobody but him. Don't, don't; I'll gladly go with you!'

'Do as I tell you!' Nora cried in a tone of authority, with a firm stamp of her petulant little foot. 'You ought to be with him. You mustn't leave him.—That's right, dear.—Now, then, Martin!'

'I 'fraid, missy.'

'Afraid! Nonsense. You're a pack of cowards. Am I afraid? and I'm a woman! You ought to be ashamed of yourself. Come along with me at once, and do as I tell you.'

The terrified negro yielded grudgingly, and crept after her in the true crouching African fashion, compelled against his will to follow implicitly the mere bidding of the stronger and more imperious nature.

They wound down the zigzag path together, under the gaunt shadows of the overhanging bamboo clumps, waving weirdly to and fro with the breeze in the feeble moonlight—the strong man slouching along timorously, shaking and starting with terror at every rustle of Nora's dress against the bracken and the tree ferns; the slight girl erect and fearless, walking a pace or two in front of her faint-hearted escort with proud self-reliance, and never pausing for a single second to cast a cautious glance to right or left among the tangled brushwood. The lights were now burning dimly in all the neighbouring negro cottages; and far away down in the distance, the long rows of gas lamps at Port-of-Spain gleamed double with elongated oblique reflections in the calm water of the sleepy harbour.

They had got half-way down the lonely gully without meeting or passing a single soul, when, at a turn of the road where the bridle-path swept aside to avoid a rainy-season torrent, a horse came quickly upon them from in front, and the rapid click of a cocked pistol warned Nora of approaching danger.

'Who goes there?' cried a sharp voice with a marked Scotch accent from the gloom before her. 'Stop this minnte, or I'll fire at you, you nigger!'

With a thrill of delight, Nora recognised the longed-for voice—the very one she was seeking. It was Dr Macfarlane, from beyond the gully, roused, like half the island, by the red glare from the Orange Grove cane-houses, and spurting up as fast as his horse could carry him, armed and on the alert, to the scene of the supposed insurrection.

'Don't shoot,' Nora answered coolly, holding her hand up in deprecation. 'A friend!—It's me, Dr Macfarlane—Nora Dupuy, coming to meet you.'

'Miss Dupuy!' the doctor cried in astonishment. 'Then they'll not have shot you, at any rate, young ledy! But what are you doing out

here alone at this time of night, I'm wondering! Have you had to run for your life from Orange Grove from these cowardly insurgent nigger fellows?

'Run from them!' Nora echoed contemptuously. 'Dr. Macfarlane, I'd like to see it. No, no; I'm too much of a Dupny ever to do that, I promise you, doctor. They can murder me, but they can't frighten me. I was coming down to look for you, for poor Mr Noel, who's lying dangerously wounded up at our house, with a wound on the arm and a terrible cut across the temple.'

'Coming alone—just in the very midst of all this business—to fetch me to look after a wounded fellow!' the doctor ejaculated half to himself, with mingled astonishment and admiration. He jumped down from his horse with a quick movement, not ungallantly, and lifted Nora up in his big arms without a word, seating her sideways, before she could remonstrate, on the awkward saddle. 'Sit you there, Miss Dupuy,' he said kindly. 'You're a brave lass, if ever there was one. I'll hold his head, and run alongside with you. We'll be up at the house again in ten minutes.'

'They've killed my father,' Nora said simply, beginning to break down at last, after her unnatural exaltation of bravery and endurance, and bursting into a sudden flood of tears. 'He's lying at home all hacked to pieces with their dreadful cutlasses; and Mr Noel's almost dead too; perhaps he'll be quite dead, doctor, before we can get there.'

(To be continued.)

'TELEGRAPHED.'

'HAVE you seen the Purple Sandpiper at Mr Walton's, telegraphed near here?' The above sentence in a friend's letter, a keen ornithologist, set me thinking. How many species of birds do I know of that have been 'telegraphed?' or, in other words, killed by flying against the telegraph wires? On looking up notes which extend over several years' observations, I found the list not a long one, but somewhat varied. As my own knowledge of this subject extends over only a small district, yet one thickly set with wires, and taking into consideration the destruction of birds by this peculiar means in this particular portion of the kingdom, and the thousands of miles of wires which extend over the rest of the British Islands, the thought crosses my mind that there must be an immense death-rate among birds through this modern invention, now a necessity of our present life.

But to return to our Purple Sandpiper (*Tringa maritima*). What brought it so far inland?—above twenty miles from its usual haunts by the shore, being purely a bird of the littoral. Was it merely a straggler lost or blown out of its course? Or was it accompanied by other Sandpipers, which escaped the fatal wires? on some line of autumnal migration which is certainly new to us, or, rather, only just suspected; and which

will take some years of careful study and note-taking before being fully established.

One of the birds most commonly 'telegraphed' with us, both in its spring and autumn 'fittings,' is the Landrail (*Oxy pratensis*), or perhaps better known as the Corncrake; indeed, in the spring migration I have known of its presence among us through this means, some time before its well-known call-note was heard; although, occasionally, individual birds stay all the winter with us. Lately, a new line of wires has been put across a common near us, to join others on one of the great north roads. These wires were put up to meet the increase of work which was expected through the introduction of the six-penny telegrams. The first Sunday after these wires were stretched, I found a Corncrake which had met its death by them. But it had suffered considerably from the attentions, presumably, paid to it by a pair of Carrion Crows (*Corvus corone*), which flopped away from its immediate neighbourhood on our approach. Shortly after, I picked up a fine cock Blackbird (*Turdus merula*) alive, but in sore condition. The skin of the breast, by the force of the blow, was rolled backward down to the thighs, one of which was broken. The contrast between the blackness of its plumage and the golden brown of the fallen beech-leaves on which it lay was something startling. I stood looking at it some time before attempting to lay hold of it, wondering what was the matter, as it lay perfectly still, looking at me with its fearless black eyes. It made no effort to get away when I laid hold of it, though it bit as well as it could. Blackbirds are common victims to this form of death: I have seen three in one week, and it is really difficult to explain why. The habit they have, might account for it, of flying about and alarming the neighbourhood by their warning note till nearly dark, long after most light-loving birds have gone to roost. A rare stranger was 'telegraphed' among us, Leath's or the Fork-tailed Petrel (*Procellaria leucorrhoa*), just after the heavy gales near the end of last October. Most of the British specimens of this bird have been obtained inland, after heavy gales blown to us, I suppose, across the Atlantic, from the Banks of Newfoundland. Snipes, both the Common and Jack, often come into collision with the wires, thus showing that they also fly after dark. A very beautiful specimen of the Common Snipe, in full breeding plumage, was brought to a friend of mine on the last day of February by a tramp, who had picked it up by the roadside, 'telegraphed.' That Owls should meet with this fate, seems very curious, as they are so specially adapted for seeing in a dull light; but such is the case. I know of several, both Barn (*Strix flammea*) and Wood (*Strix stridula*) Owls, which have been picked up dead beneath the wires. One can only account for it on the supposition that they are intent on looking for prey beneath them, perhaps watching some particular mouse or shrew at the moment the fatal contact takes place.

The Poewit or Green Plover (*Vanellus cristatus*) is another common victim to this form of death, sometimes in great numbers. Three winters ago, large flocks of plovers used to frequent particular fields at night-time, flying to and from the coast morning and night. In these daily migrations they had to pass, at one particular place, a perfect network of wires; and though odd birds had been got from time to time, yet great was the astonishment of the signalman at a box near at hand, when daylight broke one morning after a stormy night, to see the ground near his box strewn with Poewits. I should not like to say how many there were, but it took him at least twice to carry them to the nearest gamedealer's. Golden Plovers (*Charadrius plumialis*) occasionally fall victims to the same means; and I have seen a young bird of this species killed, while on its way to the coast, as early as the 9th of July, and many miles from the nearest breeding-ground. The Mistle Thrush (*Turdus viscivorus*) in its short autumnal migrations often shares the same fate; and at the same period I once saw that hideous bird, the Spotted Crake (*Porzana maculata*). I know of no instance of any of the hawks being done to death in this manner, though other observers may have been more fortunate as regards these birds. Instead, the Kestrel (*Falco tinnunculus*) often makes use of the wires as a post of observation, mice being very plentiful as a rule along railway sides; and in winter they often come out of their holes to feed on the horse-refuse on the highways. Wild-ducks also escape, as far as my knowledge goes, and we might naturally expect to see them occasionally; but that may be accounted for by their flying too high in their passage from coast to coast or to inland feeding-grounds.

Of the orthodox bird, as Sydney Smith called the Pheasant, it is in some places a very common victim. I think I could pick out one stretch of railway which at certain seasons of the year produces for the surface-man who goes along it in early morning a never-failing supply of wounded and dead birds. On one side of the railway is a long belt of plantation, where the birds are turned into after being hand-reared, on the other side a river with cornfields stretching down to it; and it is in the passage from the covers to the cornfields, when the grain is ripe or standing in stook, that the accidents occur. Partridges also often fall victims to the wires, as also did the Red Grouse where the telegraph crossed their native heaths. In more than one instance have the wires been laid underground, where crossing grouse-moors, to prevent the birds killing themselves; but even when crossing these moors in the usual style from post to post, grouse after a time get to beware of them, and deaths through this cause get fewer and fewer. One instance of this peculiar adaptation of themselves to new circumstances came very forcibly under the writer's notice. A wire-fence was put across a very good grouse-moor in Cumberland, dividing the fell into two allotments. For some time after this was done, dead or dying birds were picked up daily, until it was well known that whoever was first along the fence was sure of a grouse-pic. It was amusing to see the different stratagems employed by the shepherds and others to get along the fence without seem-

ing to do so. Indeed, I have seen two farmers meet at the 'Townfoot,' and after a short gossip, separate, going in different directions and away from the fell; and an hour after, I have heard of them meeting about the middle of the fence, both intent on dead or wounded birds. While for some time this slaughter of grouse went on, another fellow put in his appearance, this time with four legs, and made a track by the side of the fence to replenish his larder; and Mr Stoot had even the temerity to dispute the claim in one instance with the two-legged hunter. But the grouse in time got to know the dangers of the fence, and now the victims, like angels' visits, are few and far between.

The 'vermin,' as weasels and stoats are generally called, bava often a regular track beneath the wires, for the purpose of looking for dead and wounded birds. The other day I found beneath the new wires I have already mentioned a lot of scattered feathers belonging to a Redwing (*Turdus iliacus*), but no bird. Thinking it might only be wounded, I set to look for it, and after some patient hunting, found a few more feathers farther on the common. These traces I followed diligently, finding them every four or five yards apart, till in a hedge-bank fifty yards from the wires I found them thick about a small hole—no doubt the burrow of a weasel, not an uncommon animal in that same old hedge. One would have liked to have seen the weasel carrying or dragging its prey, whichever it was, the former more likely, from the traces of the feathers being left at such regular intervals. A friend informs me that he has seen the Carrion Crow regularly hunting along the wires in his district.

Another victim has just come to hand in the shape of a young Guillemot (*Uria troile*) in its first year's dress; and in the month of May I saw a Sanderling (*Calidris arenaria*) which had partially put on its nuptial garb, and was no doubt making north to the arctic regions as fast as wings could carry it, when arrested by the stretched wire.

If it were possible to get authentic statistics of all the different species and numbers of birds 'telegraphed,' we should have a mass of information which no doubt would greatly assist our ornithologists in their study of the migration of the feathered tribes. This, I am afraid, is impossible, as birds mostly fall during the hours of darkness or semi-light; and there are others, both quadrupeds and birds, which have the advantage of the genus *homo* in hunting propensities, and who are at work before he is out of bed. They are not in search of information; their hunting is prompted by something craver than even a search for knowledge. The cravings of an empty stomach must be satisfied, if possible, and who can tell how many a rare bird—which an ornithologist would have tramped miles to see—has formed a breakfast dish for a lot of hungry young weasels, or swelled out the crop of some gaunt carrion crow!

Any one living near a line of wires will find something to interest him, if he is an early riser, by searching underneath the wires in his morning walk. And when a specimen is found, a note should be taken of its name, the date, direction of wind during night, and weather; and thus

in time a quantity of information would be gathered which would materially assist our migration committees. The death-rate through being 'telegraphed' is generally greatest during the spring and autumn migrations.

A FRIEND OF THE FAMILY.

CHAPTER IV.—THE BURGLARY.

THE noise of the disturbance in the library had already attracted the attention of the Squire and his guests, who had just then reached the door of the drawing-room. When Parker announced that Major Dawkins was arrested for burglary, there was a general exclamation of incredulity; but the mention of the handcuffs elicited a little scream from Miss Euphemia and an exclamation of indignation from the Squire.

'This is too absurd. It is some rascal's practical joke; but it is one that I shall punish, for it is a disgrace to me that such a thing should be perpetrated on a guest of mine.—Friends, come with me.' He led the way to the library; and the ladies, unable to restrain their curiosity, followed the gentlemen. Perhaps they also felt some timidity at the idea of being left alone; for the numerous burglaries committed of late during the dinner hour at country-houses were trying the nerves of everybody who had property to lose.

'What is the meaning of this outrage in my house?' exclaimed the Squire. 'Release this gentleman at once. He is my guest.'

'I told you so,' ejaculated the Major, still too angry to realise fully the humiliating as well as ludicrous position in which he stood.

The detective answered the Squire respectfully and firmly: 'This is my card, sir; my name is Kidman. I am a police officer, and was sent down here to watch the movements of a man known to the police under various aliases. This is the person I have been seeking. He is pretty well disguised with his dyed hair' (the Major shuddered: the thunderbolt had fallen at last!); 'but his height and figure correspond precisely with this photograph.' He displayed the portrait of a man whose figure was certainly like the Major's, and, allowing for the effect of disguise, there might even be discovered some resemblance in the features.

'I tell you this is preposterous,' the Squire said impatiently. 'I will be responsible to you for this gentleman.'

'Well, sir, of course the affair must be disagreeable to you, only you are not the first gentleman he has taken in.'

'I say, release him at once. If you refuse, it will be at your peril. I am a justice of the peace.'

'So much the better, sir; and in that case you will permit me to tell you the circumstances under which I arrest this gentleman. I have been on the lookout for him; and from information received that an attack was to be made

upon your house, I came here this evening to watch. I posted myself in the shrubbery; and not half an hour ago, whilst you were at dinner, I saw him look from that window to spy if the coast was clear'—

'I was looking for you, Squire,' interrupted the Major.

'I couldn't guess how he had got in without me seeing him, but that is explained by his being a guest of yours. I knew he was at work, and so stepped quietly in after him. I found him so busy at one of the drawers of this table that I managed to slip these ornaments on his wrists before he could turn round.'

'At the drawers of the table!' ejaculated several voices, whilst all looked in amazed horror at the culprit.

'Yes,' continued Mr Kidman complacently, finding that he had at last made an impression; 'and this sort of thing' (holding up the jeminy) 'is not exactly what you would expect to find in a gentleman's dressing-case. I found it here on the table, and the middle drawer has been forced open with it.'

'The drawer forced open?' muttered the Squire doubtfully.

'You will find it so, and done by an experienced hand too. Will you oblige me by examining the contents of the drawer and letting me know what has been abstracted?'

'This is horrible!' said the Major, becoming calmer as the situation became more serious.

It was indeed most horrible to every one present. Miss Euphemia afterwards declared to Mrs John that she felt ready to sink through the floor, and fervently wished that she could have done so.

'The drawer has certainly been rummaged by some one,' the Squire said gravely.

'Anything valuable missing?' asked the detective, notebook in hand.

'Yes—a considerable sum of money in notes and gold.'

'Ah, I daresay our friend will be able to give us an account of the notes and gold,' was the playful comment of Mr Kidman.

'This indignity is insufferable,' said the Major stiffly; 'and I cannot understand, Elliott, why you should hesitate for a moment to release me from this degrading position. You know me; you know how easily my identity can be established. You know nothing of this man beyond his own assertion. How can you tell that he is not a confederate of the thieves, and his present action a ruse to give them time to escape?'

'That's not bad, captain,' rejoined the detective with an admiring smile. 'But these letters—which you will excuse me taking from your pocket—will show that one part of my statement is correct.—Do they belong to you, sir?'

He handed the three fatal letters to the Squire, who hastily glanced at them, whilst his wife stood on one side of him and Mrs John on the other.

'Why, that is the letter which I received!' observed Mrs Joseph with acerbity.

'And that is mine; and the other is the one which has upset poor dear Nellie so much!' cried Mrs John.

'It was to ask you again to allow me to

destroy those confounded letters, that I came to seek you, Squire, thinking that I might find you here alone after dinner,' the Major explained. 'I heard some one moving about the room, and, concluding that it was you, knocked two or three times. Getting no answer, I entered, but found nobody here. As the window was open, it occurred to me that you might have stepped out on the terrace, and I looked for you. Of course you were not there, but it must have been then that this man saw me.'

'No doubt,' answered the Squire slowly; 'but he found you at my drawer.'

'My anxiety to prevent a scandal to the family tempted me to take back my letters—for they are mine—and burn them without your leave. I knew that you would pardon me when you heard the explanation which you will have to-morrow.'

Whilst the Major spoke, the Squire was frowning.

'According to your own statement, Major Dawkins, your conduct has not been creditable to you as an honourable man.'

'I acted for the best, as you would see if you would give me leave to speak to you in private.'

They were interrupted and startled by the report of two pistol-shots in the grounds. Presently a footman rushed in with the information that they had caught a man who had jumped out of one of the windows, and he had fired upon them.

'I see the whole thing,' exclaimed the Major excitedly. 'It was the thief who was in here when I knocked; and whilst you, sir, you, have been insulting me and making a fool of yourself—if you are a detective—you have given him the opportunity to ransack the house!'

Mr Kidman looked puzzled, but he acted promptly. He removed the handcuffs, saying humbly: 'I beg pardon, sir; but mistakes will happen. I must catch that man—he is a desperate card, and uses his revolver freely.' He darted out to the terrace and disappeared.

The Squire and Maynard immediately followed. John Elliott was too timid, and the Major too indignant at the treatment to which he had been subjected, to take any part in the pursuit. After pulling himself and his ruffled garments together, he addressed his hostess, Mrs Joseph: 'I presume, madam, I may now retire?'

The lady bowed a little awkwardly, feeling some compunction for his sufferings. She hoped that a good night's rest would enable him to laugh at this painful incident, if not to forget it.

'An affair of this sort does not readily become a subject of mirth to the victim. But thanks for your kind wishes.'

He was about to retire, when Squire Elliott and Maynard returned.

'It's all right, Major. They have got the scoundrel fast bound, and he has hurt no one but himself. There are my notes and gold, which we have just taken from his pocket.'

'How did it all happen?' was the eager exclamation of the ladies.

'I offer you my cordial congratulations,' added the Major drily.

'It happened exactly as the Major surmised;

and we have to thank Nellie's headache, or whatever has kept her upstairs, for the timely discovery of the burglar. She was going into her dressing-room, and on opening the door, saw a man busy with her jewel-case. She knew what that meant—closed the door and locked it. She ran to the window and screamed out "Thieves!" The fellow took the alarm, and having the window open in readiness for such an emergency, he flung out a bundle which he had prepared. Then he slipped over the ledge, and let himself drop to the ground; but he had miscalculated the distance, and broke his leg in the fall. Two of our men, who had heard Nellie scream, were upon him before he could attempt to rise. He fired, but they had got his arms up in the air; so no harm was done; and he is safe for ten or fifteen years.'

'And the bundle—what was in it?' anxiously inquired the Squire's wife.

'A lot of trinkets and things, which are scattered all over the place, as the bundle in falling struck the branch of a hawthorn and was torn open. I have sent Parker to look after them; but we must go on ourselves.'

The ladies, whose looks of deep concern indicated how much they were interested in the search, eagerly proposed to accompany the gentlemen. Hats and shawls were quickly procured, and the whole party went forth. Nellie stole shyly down from her room and joined her friends—much to the delight of Maynard, although he endeavoured to appear cold and indifferent. She, too, wore a mask of indifference. But both were conscious that it was a mask, and that each was at heart earnestly wishing that the other would say something which would lead to an explanation. Without words, however, they somehow knew that the reconciliation would come in the morning.

The Major's presence was taken as a matter of course; for, in the excitement of the moment, his banishment was forgotten by every one except himself. He silently took his place as the special attendant of Miss Euphemia, who received his attentions as graciously as if the incident of the morning had not occurred. He was peculiarly fortunate in being the finder of most of her stolen valuables, which won him additional favour. Nearly everything was found, and a further search was to be made in the morning. So, everybody retired to rest that night with feelings of thankfulness for having had such a singular escape from heavy loss.

In the morning, there were general inquiries for the Major. His misfortunes of the previous night had toned down the anger which had been felt regarding him, and the idea now was that they had been too hard upon the well-meaning little man. All—and especially the Squire—would have been pleased to see him in his usual place at table. But as he did not appear, the only inference that could be drawn was that he felt too much hurt to make any advances.

They were rising from the table and preparing for the unpleasant business of the day, when there was a sound of carriage-wheels, followed by a loud ring at the hall-bell.

'That's Willis,' said the Squire, moving to the window and looking out, after casting a glance

of satisfaction at his wife and at his sister-in-law.

His assertion was immediately confirmed by the entrance of Parker to announce the visitor, who, without ceremony, had closely followed the butler.

After hurried greetings were over, Willis said abruptly: 'I want to get back to town to-night, and I have come down here in consequence of a telegram from Dawkins, who tells me that you have all got into a nonsensical squabble owing to his interference with the intention of setting you right.'

'I thoroughly agree with you, Willis—it is a nonsensical squabble, but who the deuce is to blame for it?' said the Squire with a good-natured laugh.

'Glad to hear you ask the question,' rejoined Willis, who, being a plain and practical person, came to the main point at once. 'The first thing you have got to understand is that Dawkins is not to blame; the next thing you have got to understand is that I am the party you have got to blow up. But before you begin with me, you had better take my good-natured brother-in-law to task, and before you do that, I want to have a few words with you, John Elliott.'

'You had better speak out whatever you have to say here,' muttered Elliott of Arrowby with a painfully feckle assumption of haughtiness.

'Would you like that, Sophy?' said Willis, addressing his sister, Mrs John.

'I think I understand the whole position, Matt,' she replied. 'Indeed, I think we all understand it now. The poor Major blundered about his letters; we all got the wrong ones, and misinterpreted their meaning. We need not go into the details, for, as you know, they would be painful to me as well as to John. Take Joe away with you, and get him to express to the Major the regret that we all feel for the annoyance we have caused him.'

'Come along,' said the Squire promptly. 'We'll pacify him somehow.' As he was passing his wife, he whispered to her: 'I hope you are satisfied now, Kitty;' and she gave an approving nod. 'But I wish he had been down with us to breakfast.'

The Squire and Matt Willis proceeded to the library; and there a very few additional words satisfied the former that the unfortunate friend of the family had been trying to discharge a disagreeable duty which he thought himself bound to undertake.

The Major was hurt enough by the awkward position in which he was placed; but that was not the reason why he kept to his chamber. He was not thinking of breakfast or the misunderstanding with his friends. Still, in his dressing-gown he was pacing the floor in a state of cruel distress. His hair was tossed about wildly and—it was of a ghastly gray-green colour! That wicked hurglar had taken away the precious Russian leather case—no doubt thinking it contained jewelry—and it had not been amongst the articles found last night. Without it, the Major could not perform his toilet. This was the cruellest blow of all to the poor man. It was impossible for him to appear before any one in his present guise; and he even avoided the mirrors, lest he should catch sight of his own

head. Hollis had been despatched to make diligent search in every spot where the case might have fallen; and his master was waiting in agony for the result. A knock at the door.—Ah, there he is at last! No, it was only Parker to say that Mr Willis had arrived, and was with the Squire in the library waiting for Major Dawkins.

'Make my excuses, please, and say that I cannot go down yet, but will be with them as soon as possible.'

A quarter of an hour elapsed, and another message came; then another more urgent, and a fourth more urgent still. The Major wished he could shave his head; it would be more presentable than that as it was now. He was bemoaning the ill-luck or stupidity of Hollis, when the Squire himself arrived at the door.

'What is the matter, Dawkins? We are all waiting for you. Are you ill?'

'Yes, yes; I am ill; but I will be with you as soon as I can.'

'Then open the door and let me shake hands with you.'

'Not just now, not just now. I'll come and shake hands with you as much as you like, in half an hour or so,' was the agitated response.

'Well, as you please; but I want to ask you to forget yesterday. Willis has explained everything, and your letters are correctly understood now. My wife is sorry that she did not take in the right meaning of the one which fell into her hands; Nellie appreciates your desire to forewarn her against any stupid gossip that fool Cousin John might spread; Mrs John thinks it was kind of you to wish to put her husband right, and he has got a lesson which he will not forget in a hurry. But she regards the whole affair as a good joke. You see, all is well; so come away at once and complete the party.'

'I am delighted; but please do excuse me, Squire. I can't come at once,' groaned the Major, passing his hand shudderingly through the besmirched hair.

'Very well, then, as soon as you can; you will find us somewhere about the lawn.' And the Squire, wondering what the Major's curious malady could be, rejoined his friends.

At last Hollis did knock at the door, bringing the joyful tidings that he had found the case—sticking between two branches of the hawthorn which had wrecked the hurglar's hundle. He had been about to abandon the search, when, happening to look up, he saw it where he never would have thought of looking for it.

The Major dressed with more than usual care, gave Hollis orders to pack up, as they were to leave that day; and then, holding himself as erect as if on parade, he proceeded in the direction of the lawn with the firm determination to bid his host and hostess good-bye. But on his way he encountered Miss Euphemia, whose gold-rimmed *pince-nez* glittered with pleasure at sight of him. 'I am so delighted to see you, Major. I—were all afraid that you were seriously ill.'

'No; not seriously ill, but considerably bothered,' he responded uncomfortably.

'Of course you must have been; but thank goodness it is all over now. The Squire and all the others are most anxious to make amends

to you for the vexation you have endured so nobly. He wants you to stay, and has sent me to persuade you not to say no.

'Stay!—It is impossible—quite impossible.'

'Oh, but you really must not bear malice—they made a mistake, and everybody does so sometimes.' She was smiling coaxingly, and looked a different being from the lady who had surveyed him through her glasses so severely yesterday.

'I respect the family as much as ever; but I cannot remain.'

'Oh, do—to please me.'

He looked at her and fancied he saw a blush. 'To please you, I would stay for ever,' he answered gallantly; 'but'—

'Then stay—for ever!' she interrupted with emphasis.

He opened his eyes. Did he understand her? Could she be serious? Had the time come for him to speak?

'Do you mean that it would be a particular pleasure to you if I remained—for your sake?'

'It would,' she answered in a low voice.

'Then I understand,' he said, taking her hand, 'this is my consolation for all the afflictions of yesterday?' She did not say no; and he, drawing her arm within his, continued: 'I am a happy man, although again a captive.'

The announcement of their engagement added much to the happiness which everybody felt in the reconciliations effected that morning. There was a merry twinkle in the Squire's eyes. He was a cunning fellow when prompted by his wife, and had guessed what would happen when he chose Miss Euphemia as his ambassador to the Major. The only person who felt in the least uncomfortable was John Elliott of Arrowby, who was now confessedly the originator of all the mischief. The only reproach he had to endure from his wife was the expression accompanied by a pitying smile, 'Poor John!'

There were festivities on a grand scale at Todhurst when Nellie and Maynard were wedded; but the marriage of Euphemia Panton and Major Dawkins was a very quiet affair—as the lady thought. She had only three bridesmaids and about twenty other friends to witness the ceremony. The Major was content to be supported by an old companion in arms and Matthew Willis.

The happy couple disappeared for six months. On returning to England, their first visit was to Todhurst. For a moment the Squire and his wife found it difficult to recognise their old friends. The Major was now a quiet elderly-looking gentleman with gray hair and moustache; and Mrs Dawkins was a subdued-looking lady, whose hair suggested that she had certainly arrived at years of discretion. They had both come to accept with resignation the inevitable signs that time passes and old age draws on; and they were happy. They had not been so in the days when they vainly struggled to hide the progress of years. The Major could never forget that morning of agony when the Russian leather case could not be found. Probably his account of it, combined with the fact that it was no longer possible to hide from each other their dabbings in the fine arts, helped his wife to agree with him that it was best to make no attempt to improve upon nature. The Major

had given up all his youthful ways, much to his own comfort; and he was firmly resolved never again to play the part of the officious friend of the family.

THE MONTH: SCIENCE AND ARTS.

ONE of the most important applications of photography is the production of printing-blocks, which, under various names, are in great request for book and newspaper illustration. It is not generally known that some of the finest illustrations which adorn high-class magazines are produced without the intervention of the engraver at any stage of the process. They are photographed direct from drawings, in some cases even from nature; and from the photograph a printing-block ready for the press is produced automatically. Oil-paintings and water-colour drawings can also be thus reproduced with the greatest fidelity. A few years back, this was impossible, for the photograph did not translate the colours in their true tone-relation to one another. Thus, yellow and red would be reproduced as black, while blue would photograph white. All this has been changed by the introduction of what is known as the isochromatic process, by which colours are rendered as a skillful artist working in Indian ink or blacklead pencil would render them.

As an outcome of this capacity of the photographic chemicals, the Royal Academy of Arts has made a new departure in the issue of an Illustrated Catalogue of the principal works exhibited at Burlington House. This is a handsome folio volume, containing one hundred and fifty fac-similes of pictures by Royal Academicians and outsiders. It is not only precious as a work of art, for every touch of the painter's brush is recognised and reproduced, but it forms a valuable record for future reference. The particular system adopted is that known as the Goupil *photogravure* process, which is worked by Messrs Boussois Valadon & Company of Paris and London. This firm have published in a similar manner selected pictures from the Paris Salons of the last two years; and we are glad that our Academy authorities have followed such a good example.

Four crematory furnaces are in course of erection at the far-famed Parisian cemetery, Père Lachaise, and will be ready for operation in a short time. These furnaces, which have the outward appearance of ornamental ovens, are built on the model of those in use at Rome and Milan. The cost of cremation will be fifteen francs only—to rich and poor alike. It is said that already sculptors and metal-workers are busy in designing and producing cinerary urns for the preservation of the ashes from these furnaces. These vessels will, at the option of the relatives of the dead, be removed to family vaults, or will be deposited in a building which is to be erected by the city of Paris for their reception.

The late discussion in the *Times* as to the permanence of water-colour drawings has led the Lords of the Committee of Council on Education to appoint a Commission to inquire into the whole subject, under the efficient chairmanship of Sir F. Leighton, the President of the Royal Academy. With him will work several well-known artists. Captain Abney and Dr Russell, who for some time have been engaged in testing the action of light upon pigments, will act as scientific advisers to the Commission.

It is reported that the recent revival of archaeological research in Italy is continually being hampered by the extortionate demands of proprietors on whose lands excavations are desirable. It is also alleged that a large trade has been organised in the manufacture of sham antiquities. Senator Fiorelli, the head of the Archaeological Department, seeks to put a stop to these abuses by the passage of a law which will place excavations under state supervision and by official permission only. It is also suggested that the smaller antiquities should only be admitted to be genuine after due examination and the attachment of some form of official stamp or seal.

The London Chamber of Commerce have under their consideration the establishment in the metropolis of Commercial Museums, or, as they might be termed, permanent exhibitions, such as are found in Holland, Belgium, Germany, France, Switzerland, and other countries. With this view, they have deputed their secretary, Mr Kenrick Murray, to visit the Museums of the chief commercial centres on the Continent. They have instructed him to report to them upon the area of the buildings used for the purpose, their financial organisation and annual expenditure, the number of visitors they receive, and their presumed effect upon the trades of the country in which they are situated. Mr Murray will bear Foreign Office introductions to the Queen's representative in the different countries which he will visit, and will, therefore, have every facility for carrying out a most important commission.

The most fearful outbreak of volcanic force which the world has experienced since the eruption of Kilauea in the Straits of Sunda, has recently laid waste many miles of the fairest part of New Zealand. It is not yet known how many human lives have been sacrificed in this terrible visitation, but it is certain that several Maori settlements have been completely destroyed, and that the country for many miles round the centre of disturbance has been literally devastated. The outbreak commenced at midnight on the 9th of last June with a succession of fearful earthquake shocks. Then, for the first time within living memory, Mount Tarawera suddenly became an active volcano, and belched forth torrents of stones and boiling mud mingled with fire and smoke. The once fertile district is covered with a layer of mud and ashes, so that those who have survived the terrible ordeal have starvation and ruin before them. One minor effect of the disaster will be regretted all the world over by those who have visited or have read of the wondrous scenery of New Zealand. The far-

famed pink and white terraces have ceased to exist. These terraces were unique, and had they been known in ancient times, must have been counted with the wonders of the world. Boiling water heavily charged with silica issued from the ground, and as it tumbled over the hillside and gradually cooled in its descent, it deposited its silica as a glittering crystallisation. Mr Froude, one of the last visitors who has written upon the subject, says: 'Stretched before us we saw the white terrace in all its strangeness: a crystal staircase, glittering and stainless as if it were ice, spreading out like an open fan from a point above us on the hillside, and projecting at the bottom into a lake, where it was perhaps two hundred yards wide.'

This hot-lake district was becoming a great sanatorium, and tourists flocked to it from all countries, for the warm water was credited with wonderful healing powers. From this circumstance alone, it was believed that the district had a great future before it. The Maoris thought not a little of the natural wonders of which they were the stewards, and took care to levy blackmail on all their visitors. All this is now at an end, for the wonders have gone, until possibly new ones are gradually developed in their stead.

Much has been written on the subject of mysterious noises, which in most cases, if intelligently inquired into, would be found to have no mystery at all about them. A Professor at Philadelphia recently recorded that at a certain hour each day one of the windows in his house rattled in the most violent manner. On consulting the local railway time-table, he could find no train running at the hour specified. But on examining another table, which included a separate line, he found that a heavy train passed at the time at a distance of several miles from his house. He then referred to the geological formation of the ground between the two points, and at once saw that there was an outcropping ledge of rock which formed a link of connection between the distant railway line and his home. It was the vibration carried by this rock from the passing train that rattled the window.

Dr Marter of Rome has discovered in many of the skulls in the different Roman and Etruscan tombs, as well as in those deposited in the various museums, interesting specimens of ancient dentistry and artificial teeth. These latter are in most cases carved out of the teeth of some large animal. In many instances, these teeth are fastened to the natural ones by bands of gold. No cases of stopped teeth have been discovered, although many cases of decay present themselves where stopping would have been advantageous. The skulls examined date as far back as the sixth century B.C., and prove that the art of dentistry and the pains of toothache are by no means modern institutions.

The city of Huesoand, in Sweden, can boast of being the first place in Europe where the streets are lighted entirely by electricity to the exclusion of gas. It has the advantage of plenty of natural water-power for driving the electric engines, so that the new light can actually be produced at a cheaper rate than the old ones.

Although many investors have burnt their fingers—metaphorically, we mean—over the elec-

tric-lighting question in this country, it seems to be becoming a profitable form of investment in America. A circular addressed by the editor of one of the American papers to the general managers of the lighting Companies has elicited the information that many of them are earning good dividends—in one case as much as eighteen per cent. for the year. As we have before had occasion to remind our readers, the price of gas in this country averages about half what it does in New York, and this fact alone would account for the more flourishing state of transatlantic electric lighting Companies.

At a half-demolished Jesuit College at Vienna, a dog lately fell through a fissure in the pavement. The efforts to rescue the poor animal led to a curious archaeological discovery. The dog had, it was found, fallen into a large vault containing ninety coffins. The existence of this underground burial-place had hitherto been quite unsuspected. The inscriptions on the coffins date back to the reign of Maria Theresa, and the bodies are of the monks of that period, and of the nobles who helped to support the monastery.

In an interesting lecture lately delivered before the Royal Institution on 'Photography as an Aid to Astronomy,' Mr A. A. Common, who is the principal British labourer in this comparatively new field of research, described his methods of working, and held out sanguine hopes of future things possible by astronomical photography. Speaking of modern dry-plate photography, he said: 'At a bound, it has gone far beyond anything that was expected of it, and bids fair to overturn a good deal of the practice that has hitherto existed among astronomers. I hope soon to see it recognised as the most potent agent of research and record that has ever been within the reach of the astronomer; so that the records which the future astronomer will use will not be the written impression of dead men's views, but veritable images of the different objects of the heavens recorded by themselves as they existed.'

Two remarkable and wonderful cases of recovery from bullet-wounds have lately taken place in the metropolis. In one case, that of a girl who was shot by her lover, the bullet is deeply imbedded in the head, too deep to admit of any operation; yet the patient has been discharged from the hospital convalescent. The other case was one of attempted suicide, the sufferer having shot himself in the head with a revolver. In this case, too, the bullet is still in the brain, and in such a position as to prevent the operation of extraction. In spite of this, the patient has been discharged from hospital care, and it is said that he suffers no inconvenience from the consequences of his rash act. A curious coincidence in connection with these cases is that both shots were fired on the same day, the 19th of June, and that both cases were treated at the London Hospital. 'The times have been,' says Shakespeare, 'that, when the brains were out, the man would die.' The poet puts these words into the mouth of Macbeth, when that wicked king sees the ghost of the murdered Banquo rise before him. In the case just cited, we have a reality which no poet could equal in romance. People walking about in the flesh with bullets in their brains are certainly

far more wonderful things than spectres. These marvellous recoveries from what, a few years ago, would have meant certain death, must be credited to surgical skill and the modern antiseptic method of treating wounds.

Magistrates are continually deploring the use of the revolver among the civil community, and hardly a week passes but some terrible accident or crime is credited to the employment of that weapon. That it is a most valuable arm when used in legitimate warfare, the paper lately read before the Royal United Service Institution by Major Kitchener amply proved. According to this paper, every nation but our own seems to consider that the revolver is the most important weapon that cavalry can be armed with. In Russia, for instance, all officers, sergeant-majors, drummers, buglers, and even clerks, carry revolvers. In Germany, again, there is a regular annual course of instruction in the use of the weapon. In our army, however, the revolver seems to be in a great measure ignored, excepting by officers on active foreign service.

A new method of detecting the source of an offensive odour in a room is given by *The Sanitarian* newspaper. In the room in question, the smell had become so unbearable that the carpet was taken up, and a carpenter was about to rip up the flooring to discover, if possible, the cause. By a happy inspiration, the services of some sanitary inspectors in the shape of a couple of bluebottle flies were first called into requisition. The flies buzzed about in their usual aggravating manner for some minutes, but eventually they settled upon the crack between two boards in the floor. The boards were thereupon taken up, and just underneath them was found the decomposing body of a rat.

The extent to which the trade in frozen meat from distant countries has grown since the introduction, only a few years back, of the system of freezing by the compression and subsequent expansion of air, is indicated by the constant arrival in this country of vast shiploads of carcasses from the antipodes. The largest cargo of dead-meat ever received lately arrived in the Thames from the Falkland Islands on board the steamship *Selembrina*. This consisted of thirty thousand frozen carcasses of sheep. This ship possesses four engines for preserving and freezing the meat, and the holds are lined with a non-conducting packing of timber and charcoal.

A new system of coating iron or steel with a covering of lead, somewhat similar in practice to the so-called galvanising process with zinc, has been introduced by Messrs Justice & Co. of Chancery Lane, London, the agents for the Ajax Metal Company of Philadelphia. Briefly described, the process consists in charging molten lead with a flux composed of sal ammoniac, arsenic, phosphorus, and borax; after which, properly cleansed iron or steel plates will when dipped therein receive a coating of the lead. The metal so protected will be valuable for roofs, in place of sheet-lead or zinc, for gutters, and for numberless purposes where far less durable materials are at present used with very false economy.

It would seem, from the results of some experiments lately conducted on the Dutch state railroads in order to discover the best method of

protecting iron from the action of the atmosphere, that red-lead paints are far more durable than those which owe their body to iron oxide. The test-plates showed also that the paint adhered to the metal with far greater tenacity if the usual scraping and brushing were replaced by pickling—that is, treatment with acid. The best results were obtained when the metal plate was first pickled in spirits of salts (hydrochloric acid) and water, then washed, and finally rubbed with oil before applying the paint.

The latest advance in electric lighting is represented by the introduction of Mr Upward's primary battery, the novelty in which consists in its being excited by a gas instead of a liquid. The gas employed is chlorine, and the battery cells have to be hermetically sealed, for chlorine is, as every dabbler in chemical experiments knows, a most suffocating and corrosive gas. In practice, this primary battery is connected with an accumulator or secondary battery, so that the electricity generated by it is stored for subsequent use. The invention represents a convenient means of producing the electric light on a small scale for domestic use, where gas-engines and dynamo-machines are not considered desirable additions to the household arrangements. The battery is made by Messrs Woodhouse and Rawson, West Kensington.

Mr Fryer's Refuse Destructor has now been adopted in several of our large towns. Newcastle is the latest which has taken up the system, and in that town thirty tons of refuse are consumed in the furnaces daily. The residue consists of between seven and eight tons of burnt clinker and dry ashes, which are used for concrete and as a bedding for pavement. There is no actual profit attached to the system, but it affords a convenient method of dealing with some of that unmanageable material which is a necessary product of large communities, and which might otherwise form an accumulation most dangerous to health.

After three years of constant work, the signal station on Ailsa Craig, in the Firth of Clyde, is announced, by the Northern Light Commissioners, to be ready for action. In foggy or snowy weather, the fog-horns which have been placed there will utter their warning blasts to mariners, and will doubtless lead to the prevention of many a shipwreck. The trumpets are of such a powerful description, that in calm weather they will be audible at a distance of nearly twenty miles from the station; and as the blasts are of a distinctive character, the captain of a ship will be easily able to recognise them, and from them to learn his whereabouts.

Mr Sinclair, the British consul at Foochow, reports that the manufacture of brick tea of varieties of tea-dust by Russian merchants, for export to Siberia, is acquiring considerable importance at Foochow. The cheapness of the tea-dust, the cheapness of manufacture, the low export duties upon it, together with the low import duties in Russia, help to make this trade successful and profitable. The brick is said to be healthfully made, and very portable. Mr Sinclair wonders that the British government does not get its supplies from the port of Foochow, as they would find it less expensive and more wholesome than what is now given the army and the navy.

He suggests that a government agent should be employed on the spot to manufacture the brick tea in the same way as adopted by the Russians there and at Hankow.

CYCLING AS A HEALTH-PRODUCT.

THE advantages of a fine physical form are underestimated by a large class of people, who have a half-defined impression that any considerable addition to the muscles and general physique must be at the expense of the mental qualities. This mistaken impression is so prevalent, that many professional literary people avoid any vigorous exercise for fear that it will be a drain upon their whole system, and thus upon their capacity for brain-work. The truth is that such complete physical inactivity has the effect of clogging the action of the blood, of retaining the impurities of the system, and of eventually bringing about a host of small nervous disorders that induce in turn mental anxiety—the worst possible drain upon the nervous organisation. When one of these people, after a year of sick-headache and dyspepsia, comes to realise that healthy nerves cannot exist without general physical health and activity, he joins a gymnasium, strains his long-unused muscles on bars and ropes, or by lifting heavy weights. The result usually is that the muscles, so long unaccustomed to use, cannot withstand the sudden strain imposed upon them, and the would-be athlete retires with some severe or perhaps fatal injury.

But occasionally he finds some especial gymnastic exercise suited to him, and weathers the first ordeal. He persists bravely, and is astonished to find that his digestion improves, his weight increases, and his mind becomes clear and brighter. He exercises systematically, and cultivates a few special muscles, perhaps those of the shoulder, to the hindrance of the complex muscles of the neck and throat; or perhaps those of the back and groin, as in rowing, to the detriment of chest, muscle, and development; and although his condition is greatly improved, he is apt to become wearied from a lack of physical exhilaration, or a lack of that sweetening of mental enjoyment which gives cycling such a lasting charm. If a man has no heart in his exercise, he will not persist in it long enough to get its finest benefits.

In the gentle swinging motion above the wheel, there is nothing to disturb the muscular or nervous system once accustomed to it; indeed, it is the experience of most cyclists that the motion is at first tranquillising to the nerves, and eventually becomes a refreshing stimulus. The man who goes through ten hours' daily mental fret and worry, will in an hour of pleasant road-riding, in the fresh sweet-scented country, throw off all its ill effects, and prepare himself for the effectual accomplishment of another day's brain-work. The steady and active employment of all the muscles, until they are well heated and healthily tired, clears the blood from the brain, sharpens the appetite, and insures a night's refreshing sleep.

In propelling the wheel, all the flexor and extensor muscles of the legs are in active motion; while in balancing, the smaller muscles of the

legs and feet and the prominent ones of the groin and thighs are brought into play. The wrist and arms are employed in steering; while the whole of the back, neck, and throat muscles are used in pulling up on the handles in a spurt. Thus the exertion is distributed more thoroughly over the whole body than in any other exercise. A tired feeling in any one part of the body is generally occasioned by a weakness caused by former disuse of the muscles located there, and this disappears as the rider becomes habituated to the new motions of the wheel. With an experienced cyclist, the sensation of fatigue does not develop itself prominently in any one part of the body, but is so evenly adjusted as to be hardly noticeable.

The wretched habit of cyclists riding with the body inclined forward has produced an habitual bent attitude with several riders, and gives rise to a prejudice against the sport as producing a 'bicycle back.' Nearly all carmen have this form of back; it has not proved detrimental, but it is ungainly, and the methods by which it is acquired in a bicycle are entirely unnecessary. Correct riding is more graceful, it develops the chest, and adds an exercise to the muscles of the throat and chest that rowing does not.

The exposure to cut-of-door air, the constant employment of the mind by the delight of changing scenery or agreeable companionship, add their contribution, and make cycling, to those who have tried practically every other sport, the most enjoyable, healthful, useful exercise ever known. Most cyclists become sound, well-made, evenly balanced, healthy men, and bid fair to leave to their descendants some such heritage of health and vigour as descended from the hairy old heroes to the men who have made this century what it is.

OCCASIONAL NOTES.

FLAX-CULTURE.

THE depressed condition of agriculture, consequent on the low prices obtainable for all kinds of produce, has led the British farmer to turn his attention to the growth of crops hitherto neglected or unthought of. This is exemplified by the interest now taken in the cultivation of tobacco and the inquiries being made regarding it, with a view to its wholesale production in England. It is doubtful, however, if in this case the British farmer will be able to compete successfully with his American rival, the latter being favoured by nature with soil and climate specially suited for the growth of the 'weed.'

There are other plants, however, which claim our attention, and amongst these the flax plant. This is perfectly hardy and easily cultivated, and is free from the bugbear of American competition. It is grown largely in Ireland, especially in the north, and at the present time is the best paying crop grown in the island. The following figures show the quantity of fibre produced during the year 1885: Ireland, 20,909 tons; Great Britain, 444 tons. As far as the British Islands are concerned, Ireland has practically a monopoly in the production of this valuable article of commerce. It was formerly

grown to a large extent in Yorkshire and in some parts of Scotland; but of late years, was given up in favour of other crops. It can now be produced to show much better results than formerly, flax not having fallen in price so much in proportion as other farm produce. Compared with the requirements of the linen manufacturers, the quantity grown in the British Isles is very small, and had to be supplemented by the import from foreign countries, during 1885, of over eighty-three thousand tons, value for three million and a half sterling. Two-thirds of this quantity is imported from Russia, the remainder principally from Holland and Belgium.

The manufacturer will give the preference to home-grown fibre provided that it is equal in all respects to the foreign. We can scarcely hope to compete successfully with Holland and Belgium, as flax-culture has been brought to great perfection there; but we can produce a fibre much superior to Russian, and if we can produce it cheap enough, can beat Russia out of the market. The average price of Irish flax in 1885 was about fifty-two pounds per ton; the yield per acre, where properly treated, would be from five to six hundredweight on an average. In many cases the yield rose far above these figures, reaching ten to twelve hundredweight, and in one instance which came under the writer's personal observation, to eighteen hundredweight. A new scutching-machine—a French patent—is now being tested in Belfast, and it is stated that by its use the yield of fibre is increased by thirty per cent. Should this apparatus come into general use, it will add greatly to the value of the flax plant as a crop. In continental countries, the seed is saved, and its value contributes largely to the profit of flax-culture there. Any difficulty that might exist in this country with regard to the preparation of the fibre for market might be met by farmers in a district banding together to provide the requisite machines, which can now be had cheaper and better than before.

If flax-culture is profitable in Ireland, it can be made so in Britain; and if only half of the eighty-three thousand tons annually imported could be grown at home, a large sum would be kept in the country which now goes to enrich the foreigner.

THE RIGHTS OF DESERTED WIVES.

A legal correspondent writes to us on this subject as follows:

'It has long been felt to be a defect in the English law that if a man deserted his wife without any cause or otherwise, she had no direct remedy against him in respect of the expense of her maintenance and the bringing up of the children (if any) of the marriage. In case the wife so deserted could carry on any business, or in any other way acquire the means of livelihood, she could obtain a protection order so early as the year 1858, long before the passing of the first Married Women's Property Act. But if she were not so fortunately situated, and had no near relatives to whom she could look for assistance, she must go into the workhouse, and leave the poor-law officers to look after her husband. This has often been productive of great hardship, for it

is no light thing for a woman delicately nurtured to become an inmate of the refuge for the destitute. But by an Act passed in the recent session, this defect has been remedied to a considerable extent in an easy and practical way. Thus, if an innocent woman has been deserted by her husband, she may have him summoned before any two justices of the peace in petty sessions or any stipendiary magistrate; and thereupon, if the justices or magistrate should be satisfied that the husband, being able wholly or in part to maintain his wife, or his wife and family, as the case may be, has willfully refused or neglected so to do, and that he has deserted his wife, they or he may order that the husband pay to his wife such weekly sum not exceeding two pounds as may be considered to be in accordance with his means, taking also into account any means which the wife may have for the support of herself and family, if any. Power is given for the alteration of the order whenever it should appear to be necessary or just, in case of any alteration in the circumstances of the husband or of the wife. And any such order may be discharged on the application of the husband, if it should appear just to do so. Writers in some of the legal journals have expressed the opinion that this change in the law goes too far; but the present writer has long advocated such a change, and it appears to be altogether an improvement upon the previous state of the law in this respect.

THE GREAT SPHINX.

An interesting work has been going on, under the direction of M. Maspéro, at the great Sphinx of Gizeh, which has been buried, all but the head, for centuries. M. Maspéro, while we write, had got down as far as the paws, on the right of which are a number of Greek inscriptions. The paws appear to be cut out of the solid stone, and afterwards built round with masonry, the surface of which is painted red with yellow additions. Bryant is of opinion that the Sphinx was originally a vast rock of different strata, which, from a shapeless mass, the Egyptians fashioned into an object of beauty and veneration. Although the excavators have now reached a lower level than Caviglia and others, yet much remains to be done before the whole of this wondrous specimen of ancient art is entirely uncovered; for, if we are to believe Pliny's statements, the head of the Sphinx was one hundred and two feet in circumference, and sixty-two feet high from the belly; whilst the body was one hundred and forty-three feet long, and was, moreover, supposed to be the sepulchre of King Amasis, who died 525 B.C. But, according to Herodotus, the body of this monarch was buried in the Temple of Saïs; and on the defeat and death of his son by the Persians, it was taken from its tomb, brutally mangled, and then publicly burnt, to the horror of the Egyptian people. If the Sphinx is really found to be a solid rock, Pliny's story of its having been a tomb falls to the ground. M. Maspéro has been working in layers of hard sand which has lain undisturbed for probably eighteen hundred years. This is found to be so close and hard, that it is more like solid stone than sand, and requires a great amount of labour

to cut through. The work is, however, progressing with energy and determination, and it is to be hoped that it will not be suffered to stop abruptly for want of funds.

NOVEL USE OF ELECTRICITY.

Electric power has been applied in a very novel manner of late on the estate of the Marquis of Salisbury at Hatfield, where it has been in operation for some time past in various ways and works; but the last is perhaps the most peculiar of all. On one of the farms, ensilage has been stored in large quantities, a farm-building being turned into a silo for this purpose; and it being decided that the green food shall be 'chaffed' before placing it in the silo, a chaff-cutter has been erected about twenty feet above the ground. This machine is not only driven by electric power, but the same motor is employed to elevate the grass to the level of the chaff-cutter. This is done so effectually that about four tons of rough grass are raised and cut per hour. A sixteen-light 'Brush' machine is the generator, driven by a huge water-wheel, and both are on the banks of the river Lea, a mile and a half distant. The power is transmitted to one of Siemens' type, specially constructed to work as a motor with the 'Brush' machine. Nor is this all, for the same electric power is ingeniously applied to work the 'lifts' in use at the many haystacks on the estate.

PICCIOLA.

(Count de Charney, when in prison, was led into a philosophical train of reflections by the sight of a flower which grew up between the flagstones of the prison court.)

O'er all the flowers that deck the verdant knoll,
And lift their snowy petals to the air,
One spray has risen in my dungeon bare
That breaks the sceptic chain that bound my soul,
And makes me feel the might of God's control.
O flower of sweetness! thy frail form so fair
Swept from my brow the cankering lines of care,
And safe will lead me to the eternal goal.
What hand but One could guard thy tender leaves
From the fierce fury of the summer sun,
When noonday hovers o'er my prison door?
'Tis He that for my hapless fortune grieves!
Blest flower! that drew me to the arms of God,
With grateful tears I bathe thy dewy sod.

ROBERT W. CRYAN.

The Conductor of CHAMBERS'S JOURNAL begs to direct the attention of CONTRIBUTORS to the following notice:

- 1st. All communications should be addressed to the 'Editor, 339 High Street, Edinburgh.'
 - 2d. For its return in case of illegibility, postage-stamps should accompany every manuscript.
 - 3d. To secure their safe return if illegible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, should have the writer's Name and Address written upon them in FULL.
 - 4th. Offerings of Verse should invariably be accompanied by a stamped and directed envelope.
- If the above rules are complied with, the Editor will do his best to insure the safe return of illegible papers.

PARK PEARLS.

By the cottage, a stranger is hailed with sharp palpable hostility, followed by a guttural sentence inwardly spoken. The watchdog pouts out his durable qualities on the intruder's ear. To prevent any misunderstanding, he tells, most forcibly, of the consequences of a nearer approach. As the inmates of the hamlet are thus warned, an unknown face gazes on him, waiting at the wicket. I love the creature's voice. It sounds of a home, although not mine. It hints of a domestic circle with chubby bairns, little dumpy arms, tiny prattling feet, dirty faces—as all children have if left to their own sweet will—children of the woods and parks, little rural arabs—the human world in miniature uncontrolled. The barking is incessant. A mellow voice spreads over the grassy lawns; on the pensive air, a hollow metallic ringing is carried out, eddying as tiny wavelets to the shore of a tiny pool—the music of an echo, touching the high towers of the mansion-house, rebounding to the forest edge—clear, fine, and pleasing. The winter sunny rays moisten the crust by the gateway, and the earth seems saturated by a shower which fell days ago—a shower of snow. Around the open glade, a stately circle of beech and fir trees marks the park's outline. The day is cold and damp; the seasons hang in the balance.

In summer here, I know a tree whereon the cushat builds, a tree of fir. On the green soft cushion around its base the children gather needles and pins for youthful household purposes—age reflected in infancy. These trees are honestly Scotch, riveted to the soil; the nettle and the thistle lower in the scale. Around the wood-pigeons' abode, mighty beeches extend their branches, and sycamores shelter the approach—trees born of ancestral days, veterans of the forest; and at eventide, when the sun is warm, carrying its fire-flame westwards, the low Coo, coo! familiarly resounds over the park—a plaintive moaning from the tree-top. The lark from the mossy meadow tells his tale of love and

devotion, going high above the forest shadows, revelling in the ether, shouting vocally in the sky, making the ævial hall ring with its joyous outpourings—a musical day-star, a pearl from earth and the clod paying homage at the footstool of light.

Over the emerald ground-work, a rook is seen; when the wind is high, he courts the lee-side of the forest, and hugs the bushes on the border, passing like a mighty rushing blast, causing the dead leaf to swirl on the grass. Atop the fence curling the copse, the magpie sits with piratical flashes in his eye, brooding over the stratagem required for further business. Down to the field he goes, and over the meadow-land on strong wing, tail floating gaily in the breeze; a gem, a pearl, a bird of surpassing beauty, up to the fir-trees, chattering harshly, loudly, defiantly. A continuous warble, an entertaining exhibition of voice-power on the part of the hedge-sparrow, enlivens the bushes under the shadow of the beeches; its capabilities of a very high order—a low, sweet, liquid song. In a meditating mood it sits; with an inquisitive air it looks for food under the stems. Its little nest is cosy; its contents four blue turquoises set in a brown environment.

Cuck-oo, cuck-oo! What a mystic sound! a half-human, a legendary echo, a resemblance half-bird, half-mammal expression; a source of infinite conjecture, a perfume from an unseen flower. There it sits, a brown, dark, spotted-like creature, with long arrow-like body, lengthy ocean-steamer-formed bird, a true migrant, a sailor on the winds, a voyager across the oceans; an outlaw, a bohemian, living by the way, dropping its egg in the nest of some absent one, leaving the care of its offspring to another; an ichneumon in feathers. Cuck-oo, cuck-oo! The sound comes from the bushes out there. No! There he sits still, not knowing he is observed. Strange bird, dweller in eternal summer climes, hater of northern blasts; and as you reflect, he is gone down the grove to seek his mate.

Following each other, wailing, calling, the

lapwings dive, rise, and scream again, flapping their rounded paddles—brilliant pearls of colour touched by the sunlight. What hilarity; what gestures they cut over the park, down the slope, and across the fields. Joyful birds, birds of the earth and the fullness thereof. The cheerful merry notes come on the breeze, and contain a wildness, a free, piquant taste of nature's high-ways. In spring, the notes bring with them the milkboy's song and the ploughman's whistle. You feel the air refreshed; a balminess fills the glade, seeks between the tree arms, clusters round the hedge, reassuring the crocus and the primrose. Your heart goes out to meet the bird, even be it unseen, as if photographed on the mind; the rural scene within a certain range springs before the imagination, called up afresh. All nature claps its hands in pride and ecstasy.

With a hurried Cha, cha, cha, cha! the black-bird leaves the stone wall—a cock-bird, black as jet—to attend his lady on the park's surface. A rollicking sprightliness characterises his movements; his tone is sharp, full of intricacies, hard to interpret. In autumn, when the nests are empty, how delightful to walk through the copse—a clump of dwarfed trees, everything in repose. The nests, the homes, the beds of the departed little ones, rest there between the forks and amongst the benty undergrowth, remnants of blithe mirth-making and droll expressions. A few feathers—vivid remembrance of garments—the broken twigs and sere leaves are toys. Singing now is in silvery strains; before, it was golden; now restricted in its compass and its range.

The pleasant from the cover skulks hastily away, and in the sun shines as a pearl of great price. His ruby head he cannot hide—it is too lovely. It sets off as a coronet his kingly robes. 'Uneasy lies the head that wears a crown.' An irresistible habit attends the luckless bird; he peers from the herbage, and the sun catches the treacherous colours, denouncing the retreat of this majestic park glory. There is an unspeakable mellowness. Insect and bird, both are loth to frolic; they are not now so fond of being seen, eluding the watchful eye. Contented trills are all that is now heard. Yellow, full-eared corn-fields, charged with the house of a season, like soldiers, laden with booty, now 'pile their arms' in squares and companies over the harvest battle-field.

With the stillness of a mid-day in the park, at that moment when even the birds are gone, the insect world vanished, there is a sudden seeming pause. The daisy and the clover say it is the meridian, the exact moment when the dial casts no side shadow. It resembles the dinner-hour, the din and rattle hushed for a time. When the cuckoos meet here in the gushing summer day, when the down-pouring of the golden rays from the clear sky parches the pebbly brook, and curls up the grass of the park, then the combination of pride, blitheness, and mid-day fervour of breezes modified, refined by the park trees, disperse in the quiet inclosure, and mingling in space with the warm air, vanish, as it were, in an unanswerable manner.

Kittiwakes from the rocky heights wander, by the aid of their beautiful wings, over the park round the copse, circling, screaming with angry

voice, with a majesty, an aristocratic air, no hurried haste. These wings are seasoned by the salt of the ocean. They move over the reefs, the shoals, the surface-swells of the landscape; but their gaze pierces not the crest of the earth, but is thrown back tauntingly, while their eyes search pleadingly. These water-washed pearls rest in twos and threes, white dots on the carpet of green. The daisy, dandelion, clover, and the tints of many grasses, cut out lovely patterns before your eyes; the primrose makes a golden margin, the bushes raise the edge. In the language of flowers, the surface holds communion. Above the long rank growth on the ditch-side, the sorrel loves to dwell, and thistles keep watch over their lowly neighbours.

A transient glimpse of a pretty bird in the depths of the bushes rivets the attention—a redstart!—jerky, flirting beauty. This tangled undergrowth seems a fit habitation only for the badger, or a likely cover for the fox. That admixture of ruby and turquoise might well adorn the scrupulously trimmed lawn before the mansion-house. Why stay in such a sequestered nook? You are an uncommon friend. Right glad am I to make the acquaintance of such as you, even here. How restless you wander along the bough, your shrill note doubtless being apprehensive of danger, away under the bushes without a parting word. A robin fills the place—that hero of many a tale, that picture-painted creature evolved from the reddish-tinted egg shells. His family meet him on the broom that overhangs the bank. The earthwork has fallen, disclosing the boughs that were once underground, appearing now like strong cables from ship to anchor. Its home is there, behind the rootlet, and between that and the earthen wall. At evening, puffed up, ball-formed, it sits challenging a robin not far off in vocal speech, a ruby spot, a blood-stained front without a scar. The notes remind you of olden days. Something is gone, is wanting; a vagueness immeasurable borders the song. There is a want, although he sings in language liquid and clear. It is in harmony with the half-sleeping water babbling through the grasses. He is a wild Red Indian, sighing, jerking, laughing, smiling at the weather of the seasons.

Two, three! Keep still; there go the rabbits. Move your foot amongst those dead leaves—magic, they are gone! Thud, thud! it is he anger, fear, or defiance. Thud! the very earth vibrates in harmony with the animals' spirit. Over the entrance, on the tree-roots grow long variegated lines of stainless white vegetation—whiter under there, against the earth—a soft quartz in a soft rock. That sapling is dead, nipped in its youth. Its leaves are golden, its virgin beauty was green. All other trees are in their native garb. In its fall, its dying agony, its roots wrenched from the soil, the earth still adhering; it had groaning, fallen, clenched its comrade; and now petrified, its arms are rigid, death-like. The hunnies burrow under the shelter of the upturned sapling; but otherwise its history is wrapped in unconcern. Only the bee, that in its flight catches the reddish glow, and halts to know the cause. The common blue butterfly, in its diurnal flight over the park in search of sweets, at times erects its wings, there exhibiting the rows of matchless pearls

imprinted on the border of its garment. The wren leaves not the tree in its misfortune, but twits its plaintive miniature trill from under the withered leaves and débris swept against its surface, accumulating with every fresh breeze.

Again the participating musical stumble of the blackbird comes from the tree-branch on the copse margin—a male voice, a haas, with variations of chattering fluency. Late insects linger at the outskirts, and roam the extent of the park. The insect hum rises from the herbage here and there; a bee, trapp'd by the spider's snare, hums, buzzing vengeance on the fisher casting his silken net there. In the bushes, a slight fluttering—a leaf floats unheard to the ground, to increase the mouldy earth. The repose is broken again and again—droning beetles, and the tingling flight of the moths flitting about the willows at the burn. The tawny owls hoot, throwing a weird enchantment on things adjacent, their muffled, softened wings carrying them from view along the forest edge. A solitary starry pearl, a snowdrop of the heavens, bursts the crust of the empyrean—then it is night.

IN ALL SHADES.

BY GRANT ALLEN,

AUTHOR OF 'DARVING,' 'STRANGE STORIES,' ETC. ETC.

CHAPTER XIII.

WHEN Nora and the doctor reached the door of Orange Grove, they found Edward Hawthorn waiting to receive them, and the servants already busy trying to remove as far as possible the signs of the wreck so lately effected by the wild rioters. Several neighbouring planters, who had come down from the hills above, stood in armed groups around the gate; and a few mounted black constables, hastily summoned to the spot by the fire, were helping to extinguish the smouldering ashes. Only Delgado's dead body lay untouched upon the sofa, stiff and motionless, for not one of the negroes dare venture to set hands upon it; and in the room within, Marian sat still, looking anxiously at Harry No. 1's pallid face and livid eyelids, and his blood-stained shirt, that yet heaved faintly and almost imperceptibly upon his broad bosom at each long slow-drawn inspiration.

'He is living?' Nora asked, in a hushed voice of painful inquiry; and Marian answered under her breath, looking up at the bluff doctor: 'Yes; he's living still. He's breathing quite regularly, though very feebly.'

As for Macfarlane, he went to work at once with the cool business-like precision and rapidity of his practised profession, opening the blood-stained shirt in front, and putting his hand in through the silk vest to feel the heart that still beat faintly and evenly. 'He's lost a great deal of blood, no doubt, Mrs Hawthorn,' he said cheerily; 'but he's a strong man, and he'll pull through yet; ye needn't be too anxious—thanks to whoever put this handkerchief around his arm. It's a good enough tourniquet to use on an emergency.—Was it you, Miss Dupuy, or Mrs Hawthorn?'

A round spot of vivid colour flashed for a moment into Nora's white cheek as she answered

quietly: 'It was me, Dr Macfarlane!' and then died out again as fast as it had come, when Macfarlane's eyes were once more removed from her burning face.

'Ye're a brave lass, and no mistake,' the doctor went on, removing the tourniquet, and stanching the fresh flow rapidly with a proper bandage, produced with mechanical routine from his coat pocket. 'Well, well, don't be afraid about him any longer. It's a big cut, and a deep cut, and it's just gone and severed a good big artery—an ugly business; but ye've taken it in time; and your bandage has been most judiciously applied; so ye may rest assured that, with a little nursing, the young man will soon be all right again, and sound as ever. A cutlass is a nasty weapon to get a wound from, because those nigger fellows don't sharpen them up to a clean edge, as they ought to do rightly, but just hack and mutilate a man in the most outrageous and unbusiness-like manner, instead of killing him outright like good Christians, with a neat, sharp, workman-like incision. But we'll pull him through—we'll pull him through yet, I don't doubt it. And if he lives, ye may have the pleasure of knowing, young lady, that it was the tourniquet ye made so cleverly that just saved him at the right moment.'

As Macfarlane finished dressing and tending Harry's wound, and Harry's eyes began to open again, slowly and glassily, for he was very faint with loss of blood, Nora, now that the excitement of that awful evening was fairly over, seemed at last to realise within herself her great loss with a sudden revulsion. Turning away passionately from Harry's bedside, she rushed into the next room, where the women-servants were already gathered around their master's body, keening and wailing as is their wont, with strange hymns and incoherent songs, wherein stray scraps of Hebrew psalms and Christian anthems were mingled incongruously with weird surviving reminiscences of African fetishism, and mystic symbols of aboriginal opeah. Fully awake now to the blow that had fallen so suddenly upon her, Nora flung herself in fierce despair by her father's side, and kissed the speechless lips two or three times over with wild remorse in her fresh agony of distress and isolation. 'Father, father!' she cried aloud, in the self-same long-drawn wail as the negroes around her, 'they've killed you, they've killed you! my darling—my darling!'

'Dem kill you—dem kill you!' echoed Rose and Nita and the other women in their wailing sing-song. 'But de Lard o' hebben himself avenged you. De grabe yawnin' wide this ebenin' for Louis Delgado. De Lard smite him—de Lard smite him!'

'Get away, all you auld crones!' the doctor said, coming in upon them suddenly with his hearty Scotch voice, that seemed to break in too harshly on the weird solemnity of the ghastly scene. 'Let me see how it was they killed your master. He's dead, you say—stone-dead, is he? Let me see—let me see, then.—Here you, there—lift up his head, will you, and put it down decently on the pillow!'

Nita did as she was told, mechanically, with a reproachful glance from her big white-fringed eyes at the too matter-of-fact and common-sense

Scotchman, and then sat down again, squatting upon the floor, moaning and crouching piteously to herself, as decorum demanded of her under such circumstances.

The doctor looked closely at the clotted blood that hung in ugly fangles on the poor old man's gray locks, and whistled a little in a dubious undertone to himself, when he saw the great gash that ran right across Mr Dupuy's left shoulder. 'An awkward cut,' he said slowly—'a very severe and awkward cut, I don't deny it. But I don't precisely see, myself, why it need have positively killed him. The loss of blood needn't have been so very excessive. He's hacked about terribly, poor old gentleman, with their ugly cutlasses, though hardly enough to have done for a Dupuy, in my opinion. They're very tough subjects indeed to kill, all the Dupuys are.'

As he spoke, he leant down cautiously over the body, and listened for a minute or two attentively with his ear at the heart and lips. Then he held his finger lightly with close scrutiny before the motionless nostrils, and shook his head once or twice in a very solemn and ominous fashion. 'It's a most singular fact,' he said with slow deliberation, looking over at Edward, 'and one full of important psychological implications, that the members of every nationality I have ever had to deal with in the whole course of my professional experience—except only the Scottish people—have a most illogical and ridiculous habit of jumping at conclusions without sufficient data to go upon. The man's not dead at all, I tell you—not a bit of it. He's breathing still, breathing visibly.'

Nora leapt up at the word with another sudden access of wild energy. 'Breathing!' she cried—'breathing, doctor! Then he'll live still. He'll get better again, will he, my darling?'

'Now ye're jumping at conclusions a second time most unwarrantably,' Macfarlane answered, with true Scotch caution. 'I will not say positively he'll get better again, for that's a question that rests entirely in the hands of the Almighty. But I do say the man's breathing—not a doubt of it.'

The discovery inspired them all at once with fresh hope for Mr Dupuy's safety. In a few minutes they had taken off his outer clothing and dressed his wounds; while Nora sat rocking herself to and fro excitedly in the American chair, her hands folded tight with interlacing fingers upon her lap, and her lips trembling with convulsive jerks, as she moaned in a low monotone to herself, between suspense and hope, after all the successive manifold terrors of that endless evening.

By-and-by the doctor turned to her kindly and gently. 'He'll do,' he said, in his most fatherly manner. 'Go to bed, lass, go to bed, I tell ye. Why, ye're bruised and beaten yourself too, pretty awkwardly! Ye'll need rest. Go to bed; an' he'll be better, we'll hope and trust, to-morrow morning.'

'I won't go to bed,' Nora said firmly, 'as long as I don't know whether he will live or not, Dr Macfarlane.'

'Why, my lass, that'll be a very long watch for ye, then, indeed, I promise you, for he'll not

be well again for many a long day yet, I'm thinking. But he'll do, I don't doubt, with care and nursing. Go to bed, now, for there'll be plenty to guard you. Mr Hawthorn and I will stop here to-night; and there's neighbours enough coming up every minute to hold the place against all the niggers in the whole of Trinidad. The country's roused now; the constabulary's alive; and the governor'll be sending up the military shortly to take care of us while you're sleeping. Go to bed at once, there's a guid lassie.'

Marian took her quickly by the arm and led her away, once more half fainting. 'You'll stop with me, dear?' Nora whispered; and Marian answered with a kiss: 'Yes, my darling; I'll stop with you as long as you want me.'

'Wait a minute,' the good doctor called out after them. 'Ye'll need something to make you sleep after all this excitement, I take it, ladies. There's nothing in the world so much recommended by the faculty under these conditions as a good stiff glass of old Highland whisky with some lime-juice and a lump of sugar in it.—Ye'll have some whisky in the house, no doubt, won't you, Uncle Ezekiel?'

In a minute or two, Uncle Ezekiel had brought the whisky and the glasses and the fruit for the lime-juice, and Macfarlane had duly concocted what he considered as a proper dose for the young ladies. Edward noticed, too, that besides the whisky, the juice, and the sugar, he poured furtively into each glass a few drops from a small phial that he took out unperceived by all the others from his waistcoat pocket. And as soon as the two girls had gone off together, the doctor whispered to him confidentially, with all the air of a most profound conspirator: 'The poor creatures wanted a little sedative to still their nerves, I consider, after all this unusual and upsetting excitement, so I've just taken the liberty to give them each a drop or two of morphia in their whisky, that'll make them both sleep as sound as a child till to-morrow morning.'

But all that night, the negroes watched and prayed loudly in their own huts with strange devotions, and the white men and the constables watched—with more oaths than prayers, after the white man's fashion—armed to the teeth around the open gate of Mr Dupuy's front garden.

RECENT NOTES FROM THE LAND OF EGYPT.

To those who are interested in ancient Egypt, and to the student of Biblical archaeology, the last few weeks have given treasures of discovery. First, there was the unbinding and exposing to view of the mummies of Ramses II. and III., and the identification of that of Queen Nofre-tari; then the discovery, by Mr Flinders Petrie, of 'El Kasr el Bint el Yahudi' (the Castle of the Jew's Daughter), which throws a flood of light upon the few verses in Jeremiah xliii. where we read that Johanan, the son of Kareah, followed by the captains of the forces, the remnant of Judah, and the Hebrew princesses, daughters of the

blinded and dethroned Zedekiah, fled to Tahpanhes, the court of Pharaoh Hophra, king of Egypt. Lastly, there was the interesting meeting of the Egyptian Exploration Fund (see *Chambers's Journal*, No. 70), when an account of the finding of the Greek settlement of Naukratis was given, and specimens of the treasures found there were exhibited. To Professor Maspéro we are indebted for the sight of the celebrated Pharaohs; and any one travelling in Egypt should not fail to visit the 'Hall of the Mummies,' in the Boulak Museum, near Cairo, where, in glass cases, they will see the faces of these kings exposed to view. First of all, before describing the appearance of the dead monarchs as they emerged from the endless folds of the mummy-cloths, it may be worth while to glance cursorily at their history.

Ramesses II.—the Sesostris of the Greeks—was the third king of the nineteenth dynasty. He bears the name of A-naktu, the Conqueror; and in the rolls of the papyri he is also called Ses, Sestura, 'Sethosis—who is called Ramesses'—and Setsu. He was a great builder, and a warrior as well. The land is filled with his buildings and with gigantic statues of himself and his family; and the walls of the temples are covered all over with vivid pictures of his battles and victories. Not only in Egypt are these to be found, but also engraven upon the rock tablets at Berytus, in Syria, are records of his victories in Asia. He does not, however, appear to have allowed his architectural plans and his warlike expeditions wholly to engross his attention, for we find him dividing the land into *nomes* or provinces, and setting governors over them. He seems to have employed the prisoners of war in making canals for the use of those who lived at a distance from the river. He also rearranged the scale of rents for land, and made the canal from the Nile to the Red Sea. In the fifth year of his reign we find him at Kadesh-on-Orontes, a fortified Syrian town: war had broken out with the Khita, a Semitic tribe, who had one of their strongholds there. After a desperate struggle, Ramesses appears to have been victorious, and ratified his treaty with the conquered people by marrying their king's daughter. We find him afterwards waging war in Palestine; and it is certain that he conquered Askelon. He transferred his court to San or Zoan, on the Tanitic arm of the Nile, and from thenceforth Pi-Ramesses became the seat of government. By many, Ramesses II. is thought to be the Pharaoh of the oppression, for whom the children of Israel built the treasure-cities of Pithom and Ramesses. Certain it is that during this reign the literature and language of Egypt became impregnated with words borrowed from Semitic sources.

The chief buildings of Ramesses II. are the Ramessum or Memnonium; a Temple of Victory at Old Qurnah, dedicated to the god Amon; the rock-temple of Ipsambul, dedicated to the chief gods of Egypt; the completion of the Temple of Amon at Luxor, which was left unfinished by Amenhotep III.; and the great hall in the Temple of Karnak. He erected two giant statues of himself and two beautiful obelisks, one of which is in Paris.

The king enjoyed a reign of sixty-seven years; part of which time he was associated with his

father. He must have been nearly one hundred years old when he died; and from the temple walls at Abydos we learn that he had sixty sons and fifty-nine daughters. This is the merest outline of Ramesses II., one of the greatest of the Egyptian kings; an essentially successful man, bold, enterprising, ambitious, and vain.

Now for his personal appearance, in so far as we can judge of it after its long repose in spices and linen bandages. For the sake of those whose faith may not be very strong, let us add that the mummy was opened by Maspéro and Brugsch—two of our greatest Egyptologists—in presence of a large number of people, English as well as Egyptian, who verified the official statement made by the high-priest Pinotem on the coffin lid, and on the outer winding-sheet of the mummy, that this was in truth the body of Ramesses II. The head is long, and small in proportion to the size of the body; the top of it is bald, but otherwise the hair is thick. At the time of death it was probably white; but the spices used in the embalmment have turned it a yellowish colour. The eyebrows, too, are white and thick; the eyes small and close together; the temples are sunken; and the nose, long, thin, and hooked, is also depressed at the tip. The tightness of the bandaging probably accounts for this. The chin is prominently and the jaw-bone massive, giving a look of determination to the face, which is covered with a thin beard and moustache. The skin is of a brown hue, with black marks on it, possibly owing to the bituminous matter used in embalming. The hands, which are crossed over the breast, are small, and dyed with henna; the legs and thighs fleshless; the feet long, slender, and although somewhat flat-soled, are well shaped. They also are stained with henna. The body is in a good state of preservation; and the corpse, which is that of a very old man, is also that of a strongly built and vigorous old man. The examination over, Professor Maspéro returned the mummy to its glass case, where, with face uncovered, it may be seen, with the mummies of Pinotem and the priest Nebsoni.

Ramesses III.—surnamed Haq-On—Prince of Iliopolis, was not the immediate successor of Ramesses II., although he appears to have taken him for his model. When he came to the throne, Egypt had degenerated to a miserable condition, and he first turned his attention to the internal affairs of the kingdom, rearranging the different castes and fixing their lines very firmly. He also started a navy, to trade with the countries near to Egypt. Many of the trees and shrubs in the valley of the Nile were planted by him, to encourage moisture in the atmosphere and give shade to the people. His buildings were not nearly so grand or so numerous as those of Ramesses II. He erected several Ramesses and a new temple at Thebes. He also converted the treasure-house at Medinet-Abou into a Temple of Victory, bringing all that was most precious into it. From some of the papyri, we find that he was to have been the victim of a plot hatched in the harem; but it was discovered, and the conspirators punished. Ramesses III. reigned more than twenty-seven years, and had eighteen sons and fourteen daughters, to the former of whom he gave the names of the sons of Ramesses II.

In his reign, the art of inlaying glass in alabaster was at its height.

Ramesses III. was altogether an inferior man to his predecessor of the same name, although probably more intelligent; and from the shape of the forehead, we might judge him to have had the intellectual capacities largely developed. But he was eaten up with vanity, and a desire to imitate in everything Ramesses II. His buildings are less numerous than that monarch's; in style they are far inferior, and the construction is poor. His wars were chiefly fought close at home, either with the neighbouring Philistines or the tribes in the frontier of his country. This, condensed into a few sentences, is the outline of his life. In appearance, as seen at Boulak, when the mummy was unencased, he was a small man, much inferior in size and build to Ramesses II., although his forehead is of better proportions. No hair is visible on either face or head; the cheek-bones are not so high, the nose not so hooked, the chin and jaw less massive. Professor Maspero thinks that the eyes were larger than those of Ramesses II., which were small; but it is difficult to be certain about this, as they have been extracted, and the lids even removed. The mouth is horribly large, and out of proportion to the rest of the face; the lips are thin; and many of the teeth are in a perfect state of preservation. The displaying of the features of Ramesses III. was indeed a proof of great skill and patience on the part of the operators, for when the last coverings were removed, the face was found to be completely hidden by a coating of bitumen, which had to be taken away piecemeal with the utmost care. The mummy, face uncovered, stands now in a glass case by the side of Ramesses II.; and the lid of the sarcophagus in which he was buried is in the Museum at Cambridge.

The mummy of Queen Nofre-tari was found with those of Ramesses II. and III. in the hiding-place at Dayr-el-Bahari; but it became in such a bad condition, and smelt so horribly, that it was necessary to get rid of it. Accordingly, Professor Maspero decided to open it; and by doing so, settled a knotty historical question. Was Nofre-tari, the popular and deeply revered queen of king Aahmes I. of the eighteenth dynasty, a negress? On some of the monuments, she is represented with fine hair and yellow skin; on others, with a distinctly negro type of face. Truly, she was worshipped at Thebes under the form of Hathor, the black goddess of Death and the nether world. Did, then, the story of her belonging to one of the black races of mankind originate in this, or was there real ground for depicting her with a black complexion? The investigation of the mummy answered the question; for although, on being opened, it began to crumble away and dissolve into black matter, it was quite possible to ascertain that she was a woman of full age and middle height, and that she belonged to the white races of mankind.

The opening of these mummies was the last official work of Professor Maspero, and the description of them is gathered from his Report. Unfortunately for all Egyptologists, he has been obliged to resign his post of Director of the Excavations and Antiquities in Egypt.

We must now pass on from the interesting Hall of Mummies, and convey ourselves in thought to a dismal, dreary corner of the north-eastern Delta, where, in the neighbourhood of the mounds of Tell-el-Defenneh, Mr Flinders Petrie has discovered the remains of the ancient palace in which Apries Hophra gave shelter to the fugitive daughters of Zedekiah. This 'Castle of the Jew's Daughter,' as it is called by the Arabs to-day—the 'Pharaoh's house in Tahpanhes' of the Bible, was built by Psammeticus I. Under the corners of the building, Mr Petrie has dug out the foundation deposits, consisting of seals, small tablets, engraved with the king's name and royal titles, bricks, &c. It was probably the stronghold of those Carian and Ionian mercenaries to whom Psammeticus granted a permanent settlement at Daphne of Pelusium. The building itself was square, lofty, and of massive structure. It stands in the remains of a quadrangular courtyard, the whole covering an area of two thousand feet in length by one thousand feet in breadth. Originally, it must have been walled in, the great boundary wall being fifty feet in thickness. A gate on the north side opened towards the canal; another on the south, to the military road between Egypt, through Palestine, into Syria. The 'Kast' also possessed a tower which has probably served at different times as an outlook, general's headquarters, and a royal palace. Nor can we assign one date only to it; it has been added to at various times, and to meet the requirements of the different owners. It is hopeless to conjecture in how many stories it was originally built; but the main part of the building contained sixteen square rooms on each floor, with walls, both outside and partition, of immense strength. Now, the basements, which are all that is left, were the offices of the royal palace, and very interesting are the discoveries which Mr Petrie has made there. First of all, there is the kitchen, a big room with deep recesses in the sides, and containing a dozen or more large jars, which somehow have managed to escape the general destruction; also two flat dishes, three small flat iron pokers, two corn-rubbers, some weights, and a large knife made of iron. Then there is a room which we may suppose to have answered to the butler's pantry, for it was evidently the room where the wine-jars were brought to be opened; but although there was not one amphora to be found, there were scores of lids lying scattered about, many of them stamped with the cartouches of Psammeticus I., and Necho, his successor. On a rubbish-heap outside were found the broken amphore, some of them having the hute-shaped 'nefer' written on them in ink, a mark signifying 'good.' There is a tiny chamber containing a sink; and from the contents of that sink, it can only have served one purpose, and that the scullery. Mr Petrie describes it as being 'formed of a large jar with the bottom knocked out, and filled with broken potsherds placed on edge. The water ran through this, and thence into more broken pots below, placed one in another, all bottomless, going down to the clean sand four or five feet below.' These sherds were literally clogged with fish-bones and animal matter.

Some small tablets engraved with the name

of Aahmes II., and a bronze seal of Apries, were also found; and in some of the other rooms were seen lying about several Greek vases, many of them well painted with representations of sphinxes, dancers, chariot-races, harpies, &c. Amongst the debris, have been picked up amulets, two rings, a sword handle with wide curved guard, some scale-armour, beads, seals, &c.; and several large amphoræ, quite perfect, and a great many broken ones, although not so badly broken but that they can be mended. The once stately building is now a heap of blackened, flame-scored ruins, while the ground all round it is thickly strewn with the debris of its past treasures. It must have fallen into very revengeful hands before even it was set on fire, for it has evidently been ruthlessly knocked to pieces and dismantled, besides being burnt. Did the king of Babylon, as is indicated in the book of Jeremiah, indeed spread his tent on the hard mud pavement in the square courtyard, and after giving over 'such as were for death to death, and such as were for captivity to captivity, and such as were for the sword to the sword,' commence the work of destruction? We cannot tell: we know that he did come, and that, according to Babylonian accounts, he conquered. The Egyptians admit that he came, but say he was defeated. Anyway, there are three *stelæ* in the Boulak Museum inscribed with his names, titles, and parentage, which there is every reason to believe were picked up by the Arabs near this place. Whether Nebuchadnezzar conquered or not, 'Pharaoh's house at Tahpanhes' is now but the wreck of a departed glory.

The recent meeting of the Egyptian Exploration Fund was particularly interesting. At it, Mr Ernest Gardner gave a vivid account of Naukratis, for the excavation of which we are indebted to Mr Petrie and himself. Naukratis was an ancient Greek settlement in Lower Egypt, whose site, until lately, was lost in obscurity. We know that it contained five celebrated temples—the Pan-Hellenion, and the temples of Zeus, Hera, Apollo, and Aphrodite; of these, four are now discovered. During this present year, Mr Gardner has found the cemetery of Naukratis. It is a little distance from the town itself, and, unfortunately, cannot be wholly excavated, as there is a modern Arab cemetery exactly over it. The part already dug out is evidently the more modern of the two, as it only contains graves subsequent to the sixth century B.C. From a strictly antiquarian point of view, it is therefore the less interesting, although that date gives the most flourishing period of the history of Naukratis. There was not one single mummified body found; the funerals were evidently conducted strictly after the manner of the Greeks. Coffins of tile and wood, the latter adorned with terra-cotta ornaments, were found in the graves; articles both of use and beauty were found buried with the dead. In one case, alongside of the deceased lady's jewellery, was found her rongepot, still half full of rouge, and beautifully painted on the outside. Among the many things found in the town itself is a portrait head of the time of Berenike II., made in blue porcelain; a fine archaic statue of Apollo as a hunter, laden with spoils; and two very fine vases of large size. The ruins of the Temple of Aphrodite,

built upon the foundations of two earlier ones, consist of little else than mud walls. In front of it is the altar, made of the ashes of the victims, bound together with a mud casing. Thus, after centuries of burial, has the excavator's spade brought us face to face with Naukratis, once the most flourishing Greek settlement and trading-port in Lower Egypt.

A TALE OF TWO KNAVERIES.

IN FOUR CHAPTERS.—CHAP. I.

It was a melancholy and foggy November morning, and in its yellow gloom that legal byway known as Southampton Buildings, Holborn, looked even more frowzy and less respectable than usual. That, at least, was the opinion of Mr Blackford, solicitor, who had no love for the scene of his daily labours, as he turned into his office at the usual hour, nodded to the clerk and the office-boy who made up his modest staff, hung up his hat and coat on their particular peg, and passing into his private room, proceeded to open and read the half-dozen letters which lay on his desk. With one exception, these were not of a pleasing or cheerful nature. There was, in the first place, a rather peremptory reminder that the office rent was overdue, and must be paid forthwith. Then came a refusal to 'settle,' by the payment of a sum of money, a doubtful compensation-for-injuries action against a Railway Company, which Mr Blackford had undertaken upon the very sporting principle of charging nothing unless he should succeed; in which happy event he would retain half the spoils. Beneath this lay a letter declining to make an advance on certain dilapidated house-property belonging to a client, and commenting sharply on certain alleged misrepresentations; and then followed two or three more such epistolary missives.

Mr Blackford's face wore a very excusable expression of disgust as he took up the last of the pile; but he brightened a little as he read it through. This at anyrate meant 'business'—above all, business for which the payment, though not large or ungrudgingly rendered, would be certain and prompt. It was signed 'William Franklin,' and it contained a request that Mr Blackford would call on the writer that day, in order to take instructions for his will. Now, William Franklin was the lawyer's best client; a retired tradesman of some wealth, and of a litigious disposition which had for several years brought as much profit to the business as all the rest of the connection put together. The solicitor hastily replied to such of his correspondents as required that attention, glanced at his diary, which showed him plenty of leisure time for the day—a far too usual circumstance with him; and was preparing to keep Mr Franklin's appointment, when his office-boy knocked and entered.

'A gentleman to see you, sir.'

'Who is it?' asked his master, rather suspiciously. Unexpected male visitors are not always welcome to a man whose finances are shaky.

'Won't give his name, sir—says he wants to see you on particular business. I think it's a new client, sir,' added the boy confidentially, understanding tolerably well the reasons of his employer's hesitation.

'Oh! Well—show him in; and don't forget to hand a chair.'

The visitor entered—a tall, dark, powerful man, with remarkably bright eyes—well dressed, as Mr Blackford, drawing comfortable auguries therefrom, at once observed.

'Take a seat,' said the solicitor. 'What can I do for you?'

The stranger sat down, glanced uneasily round the room, went back to the door, opened and closed it, and returned to his chair. 'First of all,' said he, speaking with the voice and manner of a gentleman—a voice and manner not too common among Mr Blackford's clients—'I must apologise for presenting myself in 'his mysterious way. I didn't give my name to your clerk, for reasons which you will appreciate presently. It is Willoughby—Charles Willoughby—and here is my card. I have also a letter of introduction from my landlord, a client of yours.'

'I wonder what he's done?' was Mr Blackford's silent comment as he took the proffered letter. 'Forgery, perhaps, or embezzlement. The last, most likely—if either. I daresay it's only a trumpery County Court matter, after all.'

The letter simply stated that Mr Willoughby had for the last month occupied rooms in the writer's house; that he was a very quiet lodger, and quite the gentleman; that he seemed to have plenty of money; that he had asked the writer to recommend a solicitor to him, and that the writer had at once named Mr Blackford; from whom, it was added in conclusion, a fair commission on any profits arising from the introduction would be expected by his zealous client.

'And what can I do for you, sir?' once more asked the solicitor, with the increased respect due to a man who was 'quite the gentleman' and 'seemed to have plenty of money.'

The visitor fixed an anxious look on the lawyer, and replied: 'Well, the fact is, Mr Blackford, that I have of late been greatly worried and annoyed.'

'I'm sorry to hear that. Not very pleasant in this depressing weather, is it?'

'It is not, indeed,' assented the other, with a spasmodic and mirthless laugh, which began and ended in a peculiarly sudden manner.

'What is the nature of the annoyance?'

The visitor was looking round the room in a bewildered way, and did not seem to hear the question. On its being repeated, he came to himself with a start.

'The annoyance? Oh, it is just this—that I am being followed about by people who accuse and threaten me in a most unfounded and unjustifiable manner.'

'And of what do they accuse you?'

'Well, I hardly know, the accusations are so extremely vague. But they all point to horrible crimes committed in the past, without particularly

specifying them. The threats are distinct enough: I am to be utterly ruined by exposuro and denunciation.'

'Have you ever done anything which would be likely to give these people a hold on you? You can be perfectly frank with me, you know; we lawyers hear a great many curious things, but we never talk about them. Few men can say that their lives will bear very close inspection.'

'I declare to you solemnly that I can reproach myself with nothing which, if known, would produce the consequences with which I am threatened. But you know persistent slander is sure to make its mark sooner or later; it is impossible to say what harm may have been done already.'

'Who are the people?'

'I don't know.' Before giving this unexpected answer, Willoughby looked down on the floor and round the room with the same lost and puzzled air as before.

'You don't know who they are!' said Mr Blackford with incredulity. 'That's rather strange, isn't it?—Come, Mr Willoughby; we are quite alone. Who are they?'

'I can't tell you,' repeated the client; 'I wish I could.' He looked at the lawyer with a pitifully anxious expression, and beads of perspiration began to appear on his forehead.

'When and where do they attack you?'

'Incessantly and everywhere. I am never safe from them. Principally at my lodgings, and after I am in bed at night. They keep me awake with their outcry.'

Mr Blackford began to be puzzled. His new acquaintance continued to regard him with the same eager and helpless look, and wiped his forehead with a tremulous hand.

'But—but—bless me,' said the lawyer, 'if they come and annoy you in your lodgings, why don't you give them in charge?—How many are there of them?'

Willoughby shook his head gloomily. 'They are too cunning for that,' he answered. 'They are careful to keep out of my sight. I never set eyes on them; I only hear their voices. And they are in hundreds—in thousands, for all I can tell.'

Mr Blackford of course at once understood the true state of the case, and the discovery was not a pleasant one. He was by no means a nervous man, yet he experienced an electrical sensation in the scalp of his head at the idea that he was sitting within a yard of an athletic madman. (Clearly, it would not do to contradict so opinionated a person as this was likely to be; he must be humoured, and induced, if possible, to go away quietly.)

'That's awkward—very awkward,' said the solicitor in a reflective tone. 'If we can't see them, you know, how can we get at them so as to set the law in motion?'

'I can't tell what to do,' said the other despondently; 'that is why I have come to consult you. All I know is that they continue to denounce and threaten me night and day, and that it cannot go on without being noticed. In that case, my character will be materially injured, and they will have attained their object. Besides, they are killing me, Mr Blackford. A man

can't exist without sleep, and I have had but little for weeks past. And now I learn that they are contriving a plan to relieve one another at night, so as to keep me awake.'

There was something inexpressibly grim in the earnest yet matter-of-fact way in which these impossibilities were related; with agitation, indeed, but with nothing in the nature of abnormal excitement or maniacal frenzy. He spoke as a man who found great matter for trouble, but none for astonishment, in the nightly irruption into his lodgings of hundreds or thousands of abusive persons, whose numbers were no hindrance to their remaining effectually concealed in the space of two small rooms. But he surveyed the walls and floor at more frequent intervals in his dazed manner, as though he suddenly found himself in a strange place, while his moist and shaking hands nervously and convulsively worked his handkerchief into a compact ball.

Actuated at first by the best motives, Mr Blackford began to question him cautiously as to his connections and private affairs. It seemed that, with the exception of some distant relatives at the Cape, he was alone in the world; nor did he appear to have any friends in England upon whom he could rely. Having elicited the further fact that he had an income of five hundred pounds a year, derived from funded property, the solicitor ceased his questions and delivered himself up to reflection, while his client anxiously awaited the voice of the oracle.

There are many members of the junior branch of the legal profession who are of unbending uprightness and fastidious honour; there are a few downright knaves; and there are others who stand neither on the upper nor on the lower rungs of the moral ladder, but occupy a position somewhere about the middle. These last are equally prepared to be honest should honesty be made easy for them, or rogues in the face of difficulty or temptation; and among their number was Mr Blackford. He was not altogether favourably known to his brother practitioners; but neither could any definite charge be brought against him. He had done things which were certainly worthy of condemnation; but he had hitherto kept clear of any offence which would endanger his position on the rolls. He dressed neatly, he had a good manner and a correct accent, and he did not drink. His business was small, and not of a high class, lying mostly among the smaller sort of tradesmen; yet he had a certain connection, and even a few clients of means and fair position; and he was said to understand his work. He was quite without capital, and lived a hand-to-mouth life; and he had certain extravagant tastes of the lower kind. Money was always scarce with him, and he was prepared to acquire it in any way which offered, so that it was unattended with risk; for he was quite unburdened with scruples, considering all profit fair which could be safely gained. And he thought that in this case he saw a chance of such profit. Willoughby had answered all his questions, some of them bordering on impertinence, in the most open and unreserved fashion; he was evidently disposed to place the fullest confidence in his legal adviser, looking to him for sympathy and deliverance. Mr Blackford felt more at his ease in thus parleying with a

probably dangerous lunatic, than a few minutes before he would have thought possible.

The upshot of his meditations was that he concluded to abandon, at all events for the present, his first very proper and humane purpose of communicating with the police, and trying to induce them to deal with the case as that of a lunatic at large, so that the poor fellow might be properly cared for until his friends could be communicated with. For this he substituted a different plan of action with admirable readiness, and with an entire absence of pity or compunction. It was clear that there was money to be made out of the man by judicious handling; and Mr Blackford was of opinion that no one could be better qualified to make it, or more deserving of it when made, than himself.

He accordingly advised that the threats and accusations should for the present be treated with contempt. No doubt they were made for the purpose of extorting money; any sign that they were producing an effect would only cause the annoyance to be redoubled. In the meantime he, Blackford, would use his wide experience and not inconsiderable abilities in his client's behalf, and had no doubt of the ultimate success of his endeavours to discover the offenders and bring them to justice. The poor madman, with tears in his eyes, thanked him for his kindness and attention, declared that a load had been lifted from his mind, and was about to withdraw, when the solicitor stopped him with an air of having suddenly recollected something.

'By the way,' said he, 'it's hardly worth mentioning—but cases of this nature involve considerable expense to begin with, in the way of inquiries and so forth. It is generally the custom— Well, to put it plainly, I think I must ask you for a small present payment on account; say five pounds or so.'

'Of course, of course—certainly,' said the other, fumbling nervously in his pocket. 'I am much obliged to you for mentioning it; this is my first experience of the kind, I am happy to say. I have not quite the sum you mention with me at this moment. Would three pounds ten be enough for the present? and I will send the rest by post.'

'O yes, that will do very well; only a matter of form, you know,' said the solicitor carelessly, but laying an eager grasp upon the coins. 'I hope to write to you satisfactorily before long—till then, good-bye.'

So soon as his new client had left, Mr Blackford assumed his coat and hat and went off to keep his appointment with Mr Franklin, who lived in Camden Town with his married niece and her husband. As the solicitor strode rapidly along, he felt a different being from the man who, but a short half-hour before, had been reading his letters in so despondent a mood. The sudden and unwonted accession of business from two quarters at once on the same day gave him a feeling of importance; and the consciousness of the four unexpected gold coins in his pocket thrilled through him with a comforting glow, like that of a glass of old ale on a frosty day. Willoughby, if properly managed, might prove a small gold mine before his madness should develop itself to an extent incompatible with attention to legal matters; and visions arose

before him of a possible inquiry *de lunatico*, with its expensive accompaniments of the appointment of a 'committee' and the administration of a nice little estate; all to be conducted, in the not distant future, to his great pecuniary profit, by that trustworthy and able man of law, James Blackford. His castle-building extended, to an important family connection thence to arise; to the hiring of more commodious offices in a better situation, necessitated by a rapidly increasing business; and by the time that he found himself at the end of his walk, the unpaid rent and the uncompromised compensation action had faded in a glow of splendid possibilities.

Mr William Franklin was a tall and gaunt old man, with a red face, on which dwelt continually a savage and sardonic smile, framed in a bristling fringe of silvery-white hair. His character might almost be summed up in the expressive phrase of certain of his acquaintance—friends he had none—by whom it was predicated of him that he was 'an ugly customer.' He was, in fact, an evil-tempered and malicious bully, whose selfish and tyrannical disposition had been fostered by an undue consciousness of the twenty-five thousand pounds which he had made in business, and by the assiduous court which his wealth caused to be paid to him by expectant relatives, with all of whom he took pleasure in quarrelling in turn, enjoying with a fiendish glee their subsequent agonies of self-abasement.

"So, it's you at last!" said this amiable old gentleman, when Mr Blackford was shown into his presence. "Thought you were never coming. What's kept you?"

The solicitor, with great humility of manner, apologised for the unavoidable delay, and alluded to the overwhelming pressure of business and the constant calls upon his time.

"Oh, I'm sure—I'm sorry to have put you about so," said Mr Franklin with vast politeness. "I couldn't think of detaining you when you're so busy. It's a matter of no consequence, after all. Pray, don't wait; I'll send to Jones and Crowder; I daresay they won't be too much engaged to come at once."

Greatly alarmed, Mr Blackford hastened to protest that his time was entirely at Mr Franklin's disposal.

"Then don't tell me a pack of lies!" roared the client with an instantaneous change of manner, facing round from the fireplace, poker in hand, with every apparent intention of committing a violent assault upon his solicitor. "Man alive! don't I know that it's just as much as you can do to keep body and soul together in that poky little hole of an office of yours?—*Business*, indeed! As if I wasn't about the only decent client you have! And why I am your client, goodness only knows. It's compassion, I suppose. I always was too soft-hearted for this world."

His visitor could have furnished him with a better reason—namely, that no other lawyer had ever been found capable of putting up with his insolence and tyranny. But Mr Blackford had plenty of self-control, and could bear a good deal where anything was to be got by doing so.

The soft-hearted gentleman smote the coals violently, fulminating subdued anathemas the while with a dreadful grin. The solicitor, know-

ing his man, remained perfectly quiet; and presently Mr Franklin spoke again, abruptly, but in a quieter tone.

"Here! I want to make my will. I'm going to do it at last—in a fashion that will astonish some of 'em. They've been anxious enough about it these ten years and more. I hope it'll please 'em when it's done. A set of hungry hounds! Ready to lick the dirt off my boots for the money, and nothing too bad to say of me behind my back. I know it as well as if I heard it. Not a penny—not a penny for one of 'em! I'd rather take it into my grave with me—not but what they'd grub me up again, if I was in the middle of the earth."

There was again a short silence. Mr Blackford awaited his instructions.

"Then there's this young Tom Wedlake been giving me his sance, just because I spoke a word to that lazy young baggage of a wife of his—said he wasn't going to stand it—he wasn't going to stand it—the beggar! and if I didn't like it, I could go. *Will I!* I'll stay here, just to spite him. Besides, I'm a deal too comfortable to move. She won't let him turn me out—the artful minx. "Dear uncle—don't be cross with me, dear uncle!" said Mr Franklin with an access of fury, and a ludicrous assumption of a feminine lalsetto. "Leave all your money to your niece, dear uncle; that's what you've got to do." Not a brass farthing, by Jove! He doesn't want my money, doesn't he? and he has the impudence to tell me so! Very good, Mr Thomas Wedlake; I'll take you at your word. I'll pay you out, you—you—rapscallion!"

The furious monologue seemed to have spun itself out; so Mr Blackford ventured a word.

"Then I gather, sir, that you do not intend to leave any portion of your property to your nephew and niece—and I have no doubt you are exercising a sound discretion, as always. But as you are justly offended with your other relations, what disposition do you think of making?"

"Mind your own business!" was the unexpected retort.

Mr Blackford felt rather aggrieved, as the matter was clearly his business; but he said nothing. The old man continued his jerky discourse, addressed more to himself than to his visitor.

"You're right, though.—What shall I do with it? I've been asking myself the same question ever since I wrote to you last night; and now you're here, I'm no nearer the answer. It's a deal of money, hard got, and soon spent; and I don't know who it's to go to. Plaguy hard to leave it at all. No good grumbling about that, though. I won't give it to an hospital, or build a church, or endow almshouses; I've no patience with that sort of humbug. As if a man hadn't been robbed enough all these years, what with rates and what with taxes. I can't keep the money myself, and there's no one to give it to—no one."

Perhaps, through that heart, all seared and scorched with evil passions, eaten through and through with corroding suspicion, there darted a momentary pang at the thought that there was not a human being from whom the gift of all his painfully acquired wealth would buy one tear

of sorrow, or even one grateful remembrance of the giver.

He sat brooding with a gloomy brow; and this time the silence was so long that Mr Blackford was about to break it at the risk of another rebuke, when Mr Franklin smote his hand upon his thigh and laughed—a harsh and cackling laugh, devoid of mirth or geniality.

'Blackford,' said he, 'I'll leave it to you!'

Had the lawyer received a blow from the ready poker which stood in the nearest corner of the fireplace, he could hardly have been more thoroughly stunned. 'To me!' he managed to gasp out, after a moment's astounded silence.

'I'll leave it to you!' repeated Mr Franklin, nodding emphatically. 'Ain't you willing, that you stare like a stuck pig? It's not because of any regard for you—don't think it. I'll leave it to you, just because it will be about the worst kind of sell for 'em all I could anyhow invent. I hate 'em—every one! and the thought of their faces when they come to hear the will read, will be about the only consolation I shall have for being obliged to part with it at all. And mind you, I shall make it a condition that they do hear it read. You are to call them all together for the purpose, and you're not to breathe a word beforehand of the nice little surprise in store for 'em. Every man-Jack will think he's been "remembered"—and so he has, I assure you! You'll have a nice time of it with 'em, Blackford. D'ye quail at the thought of it—eh? If so, say the word, and we'll think of something else.'

'Not on my account, I beg,' said the solicitor, recovering his senses. 'I daresay I shall be equal to the occasion. But Mr Franklin, my dear sir, how am I to thank you for such munificence?—'

'You'd better not thank me at all, if you're wise,' said the eccentric testator; 'you may sicken me like the rest, and then I shall alter my mind. Hosh! I know you well enough. You'll try to double the money as soon as you get it; and you'll either lose it all and hang yourself, or you'll get mixed up in some piece of rascality that will bring you to penal servitude. You have my instructions. Go and make the will; and bring it here to-morrow, and I'll sign it. And look here! bring two witnesses with you; I don't want any one in this house to know what I've been about. Here's a list of the securities. Be off! Good-bye—get out!' And with this unceremonious dismissal, the interview came to an end.

As he hurried back to his office, Mr Blackford was able at last to realise the immensity of the good luck which had befallen him in this extraordinary manner. Twenty-five thousand pounds, all invested in sound Stock Exchange securities! Good-bye to the strife for bread; to the trap-net of petty pecuniary embarrassments which meets and deadens effort at every struggle; to the haunting care which makes hard the nightly pillow and drives away slumber before the dawn; to the hand-to-mouth existence, and the thousand-and-one daily degradations of a struggling professional man. Good-bye to one and all—if Mr Franklin's suddenly conceived purpose would but hold until he should in good time, the best of time, betake himself to a region where codicils are an impossibility. But one thought was

present to the lawyer's mind at that moment—to get the will drawn and signed with all possible expedition; but one hope was his—that his client might thereafter make an edifying end with as little delay as possible.

AVALANCHES.

THE word avalanche carries with it a sound of terror and dismay, which may well appal any mind. Happily, avalanches are unknown in Great Britain; but in Switzerland they are sadly too frequent. They are known also under other names in some parts of Italy and Germany. Avalanches consist of large accumulations of snow, set free by some means, descending from an elevated region to the valley. Their action is more or less twofold: chiefly by the mass of the snow sweeping away or overwhelming everything which comes in its course; but also, sometimes, by so violently disturbing the air as to cause a hurricane, which in its destructive force kills men and cattle, and tears up trees and even houses from their solid foundations.

Avalanches have been divided into four classes. There are powdery avalanches, in which the snow and ice break up into powder, forming a kind of silver cloud, sparkling like quicksilver, and making a noise like distant thunder. This kind is more dangerous by reason of the commotion produced in the air, than by its weight or power to overwhelm. There are what are called creeping avalanches. The mass of snow, being disengaged, moves down a more gentle slope, as on an inclined plane, and so is sluggish in its course. Then there is the glacier avalanche, which consists of a large mass of ice detached from the glacier above, which descends to the valley. This is the least dangerous kind, and is more common in summer. Lastly, there is the avalanche proper, which is the most dangerous of all, and consists of vast accumulations of snow set free from above, which increase in force as they descend, overthrowing houses, tearing up trees, burying villages, and swallowing up forests, cattle, and human beings. Sometimes, however, an avalanche may change its character in its descent; as, for instance, a creeping avalanche may reach a steep declivity, and the mass of snow falling on the sharp angles of a rock, it may be shattered, and its mass dispersed in a cloud of powdery snow. Cases occur sometimes in which, instead of burying the objects with which they come in contact, they drive them into the valley, and deposit them at a considerable distance from their original position. A remarkable case of this kind occurred in 1806; an avalanche which fell in the Val Chauda, transferred an entire forest to the other side of the valley, and planted a fir-tree on the roof of the rector's house!

An instance may be given of the effects of a powdery avalanche which occurred in the Oberland, in the canton of Berne. It was on the 12th of December 1808, about six o'clock, that the avalanche descended on the village of Shirmatt, sweeping away three houses, and carrying one of them fully three hundred yards, and some portions of it more than half a mile. In one house two persons were smothered by the snow,

and five in the other. The third house contained six children and their uncle. Some of the children were in bed, and the rest were sitting at a table learning their catechism. All at once the light was put out, a thick darkness surrounded them, they felt themselves enveloped in snow, and whirled along they knew not whither. Presently a deep ditch stopped the progress of the house. The uncle, soon recovering his presence of mind, began to grope about the snow for the children. After a long search, he found them—all alive, and not seriously injured. He took them to a barn near by, where they were obliged to spend the remainder of the night, some of them almost naked, though the cold was intense. The father of the children was engaged with his cows at a shed at some distance, and was horror-struck, when he returned to where his house had stood, to find it gone—swallowed up, as he supposed, with the whole of his family. But his fears were soon exchanged for joy; and the sight of the meeting of the father and his children and brother affected the roughest of the bystanders to tears.

On the same evening, a second avalanche fell, and was fatal to the inhabitants of another house. The only living thing which survived was a little dog which had taken refuge in the cellar. As soon as the ruins of the house were removed, he jumped out of his hiding-place, barking at the workmen.

In this case was an instance of the hurricane produced by the agitation of the air by means of the descending cloud of powdery snow. Several cattle-houses, with the cattle, were torn from the ground and driven like chaff before the wind. There was also another instance of the wonderful power of the hurricane in the case of a barn full of hay, which was carried more than a quarter of a mile, and deposited on the opposite side of the river in its right position, with its contents uninjured!

It has sometimes happened that the snow has not fallen to a sufficient thickness to crush the houses, in which event the inmates have more chance of being saved, as the porous character of the powdered snow allows of sufficient air to sustain respiration. This was the case when, in 1749, the entire village of Tanetsch, in the Grisons, was one night overwhelmed by a powdery avalanche, which descended so noiselessly that the inhabitants were not aware of the calamity, and wondered in the morning why the day did not break. One hundred persons were covered in by the snow in their houses, sixty of whom were got out unhurt.

But perhaps the most remarkable instance of imprisonment in the snow of a descending avalanche occurred in the hamlet of Bergeletto, in the valley of the Upper Stura, at the foot of the Alps, near the fortress of Deuonte, in Piedmont. Three persons survived an incarceration of five weeks. It was in the winter of 1755, when the falls of snow had been so very heavy that there was danger that its weight would break through the roofs of the houses. On the 19th of March, therefore, some of the people tried to avoid the danger by removing the snow from their house-tops. Among those so engaged were a man named Roccia, and his son, a lad of fifteen. The village clergyman was at this

time leaving his house for his church, when he saw two avalanches descending. Calling to Roccia and his son, he returned speedily to his own dwelling. Father and son instantly fled towards the church. They had not run more than forty yards when the lad fell close behind his father, who, turning round to assist his son, was seized with horror on seeing that his own house and the houses of his neighbours were buried beneath an enormous pile of snow. His earthly all was swallowed up—his wife, his sister, his children, gone! The shock overcame him, and he fainted. His son soon recovered himself, and helped his father to the house of a friend; but he was five days before he was sufficiently restored to make any exertions in seeking his lost ones. Thirty houses were destroyed, and twenty-two persons were missing, among them the clergyman who gave the alarm. The snow lay over the village to a depth of more than forty feet, and extended its destruction some ninety yards in length by twenty broad.

The news of the disaster brought more than three hundred men from the neighbouring valleys. With iron rods, they sought to discover where the houses were; and then they commenced digging vigorously; but the depth of snow was so great (another heavy fall coming on) that they could make little or no progress, and were compelled to desist, after toiling for several days. No hope could they entertain of any one being preserved alive; and as the warm winds were expected to set in in less than a month, they resolved to wait until the mass should be partly melted.

On the 18th of April the men returned to their sad task. Roccia was among the most active of the workers. Though he had no hope that he should ever see any of his dear family alive, yet he laboured diligently, assisted by his son and a brother-in-law. After six days they advanced so far, that by breaking through two yards of ice they could touch the ground with a long pole. On the following day they were joined by another brother of his wife, who had been led to come and assist by a dream which he had, in which he saw his sister alive, begging of him to help her. Setting to work with new vigour, the four rescuers made their way into Roccia's house—but it was silent and tenantless. Thinking that those they sought might have taken refuge in a stable which stood in a sheltered position some thirty yards from the house, they renewed their energies in that direction. After burrowing through the snow for some time, one of them thrust a pole through an opening. On withdrawing it, they heard a faint voice say: 'Help, dear husband! help, dear brother!' They now worked away with redoubled industry, and soon made a considerable opening, through which one of the brothers descended. The spot was totally dark, and he could see no one. 'Any one here?' he cried. His sister answered in trembling and broken accents: 'It is I, dear brother. My sister-in-law and my daughter are alive too. I have always trusted in God that He would send me relief, and He has been graciously pleased to preserve me and deliver me.'

Her husband and other brother also descended; and there were joy and tears and thankfulness beyond expression.

The imprisoned women were too weak to move, and were shrunk almost to skeletons. With great tenderness they were removed to the house of a friend, where they were put to bed and nursed with care and affection. The daughter recovered soonest, and the unmarried woman was able to walk in a week or two; but Roccia's wife, who had been in a more cramped position than the rest, was the last to regain the use of her limbs; and her eyes were ever afterwards affected with dimness, from being suddenly brought out of her prison into the light of day.

We give a description of their imprisonment from the lips of Roccia's wife. When the dire calamity befell them, she was in the stable with her sister. They had gone there with some rye-flour gruel for one of the goats which, on the evening before, had brought forth two dead kids. Roccia's daughter and a younger son were with the women, standing in a corner among the animals, waiting for the sound of the bell to go to church. In the stable were a donkey, six goats, and half-a-dozen fowls. Roccia's wife was about to leave the stable to go to her own house. Scarcely had she reached the stable door, when she heard the warning voice of the minister. Looking up, she saw the descending avalanche, and heard a sound as of another at some little distance. She hurried back into the stable and told her sister and her children. In a few minutes the snow descended upon the building, crashing in the roof and part of the ceiling. To save themselves they got into the rack and manger, the latter being under the main posts of the building, and therefore able to bear the immense pressure. They occupied, however, a very uncomfortable posture, crouching against the wall in a space only a little more than a yard in breadth. They had escaped instant death, but the more painful and lingering death by famine seemed certainly to await them. They were oppressed with the thought of how they could subsist under such circumstances. The children did not lose heart; they said they had had breakfast, and could do very well until the next morning. The aunt had a few chestnuts in her pocket; and two each of these served for their supper, with snow-water as a beverage. In the bakehouse near the stable was the whole produce of yesterday's baking. They made repeated attempts to force their way through the snow to the bakehouse, but all in vain. There was only one resource left, and that was the goat which had recently brought forth the two dead kids. This supply proved invaluable. On the second day they felt the pangs of hunger; they divided the remaining chestnuts among them, and also a quart of goat's milk. The third day they made another effort to get to the bakehouse; but the weight of snow was too much for them, so they gave up all hopes of help from that direction. They were therefore shut up to the milk of the one goat.

To feed the goats was now one great object. Two of them were near the manger—the one already yielding milk; and the other, being with young, might be expected soon to do so, if they could only supply them with food. Over the manger where they lay was a hole into the hayloft; through this hole they pulled down the fodder into the rack; and when they could no

longer reach it, the sagacious creatures climbed upon their shoulders and helped themselves.

At the end of the first week, the boy began to sink. He had complained of great pain in his stomach. His mother nursed him in her lap for a whole week, when he desired to lie his length in the manger. His hands and lips were cold, and his respiration feeble. His mother put a little milk to his lips, but he could not take it; and then with one tender cry, 'O my father in the snow! O father, father!' he expired.

Throughout the whole of their imprisonment they were in total darkness. For nearly three weeks the crowing of the cock enabled them to distinguish night from day; but at the end of this term chattering died, and his companions followed him one by one. They then literally took 'no note of time.' The donkey and the other goats were very restless for some time, but at length they fell a prey to hunger and exhaustion. The milk of the first goat gradually diminished; but the kidding of the second increased the supply, and as they killed the kid, though with great reluctance, the supply held out until the day of their deliverance. The poor goat became quite a solace to them, as it was so tame as to lick their hands and face. The poor creature was ever afterwards an object of great affection in the family.

We need only add one or two interesting facts. During their five weeks' imprisonment they suffered little uneasiness from hunger after the first week. The effluvia from the dead animals were far more disagreeable, as also the vermin which infested the place, and the great coldness of the snow-water which trickled over them. The constrained position was also a source of great misery. During the whole of the time, Mrs. Roccia had no sleep; but her daughter and her sister had intervals of repose equal to their nightly rest. Their deliverance was a matter of great thankfulness to all concerned; and many a winter's evening was spent in relating around their humble hearth the sufferings, the mercies, and the deliverance of that eventful time.

A NIGHT IN AN INDIAN HILL-FORT.

SOME short time ago, I being then an insignificant member of the Army Headquarters staff at Simla, the hill-capital of India, it became desirable to increase the number of hill-stations for the summer accommodation of British troops. It was thought that the Chor mountain, the most prominent peak of which is some sixty miles from Simla, would on its lower ridges afford suitable sites; and accordingly, a Committee of officers was formed for the purpose of reconnoitring and making a report. This Committee consisted of a well-known general, a major of Engineers, and myself, a humble sub. Somewhat trying work it was to get to the Chor, the road being of the most breakneck description, and the monsoon rains showing symptoms of bursting for our especial delectation. However, we trudged on manfully, climbed to the very topmost peak of the Chor, which by our aneroid we made over twelve thousand feet, and saw—

nothing; for, by evil chance, one of the most magnificent views in Asia was barred to us by clouds which shut out everything except the first mile or two of the hog-backed ridges below us. Disappointed, we descended; and that night it was arranged we should separate and return to Simla by different routes, so as to make the President's report as comprehensive as possible. In the execution of this idea, I found myself the next day at a place called Bhairogh, whence I proceeded—on foot, for we had been obliged to send our ponies back, owing to the state of the road—to a village called Tali. Here at first I thought of camping, as I had come some eleven miles up hill and down dale; but the place was so bare and I was so anxious to push on, being short of provisions, that I suddenly determined to double my march and make for a fort called Rajgarh, and described as being some twelve miles farther on. Unfortunately, I was dilatory in starting; the march, as usual, was longer than I had been led to suppose; the road was billy, and it was not until about nine p.m. that I found myself peering through the darkness in the vicinity of my destined camp.

Camp, did I say? It was very soon evident that there was to be no camp for me that evening, and, what was still more objectionable, no supper. Slowly as I had walked, my servant with whom was all my money, and the coolies with my tent and kit, were miles behind. It was too late for such an unkempt ragamuffin as I undoubtedly was to disturb the garrison, so I shortly made up my mind to bivouac peacefully under a tree. Just outside the fort, however, and close to the spot I had marked out for my resting-place, two natives, by the light of a fire, were hammering some metal vessel with such animation as to wholly preclude the possibility of sleep. To these enthusiasts I explained that I was a sahib, and suggested they should postpone their operations till next morning. They, naturally enough perhaps, demurred; and I wrangled, and they continued their metallic fantasia until I could stand it no longer. Thinking, perhaps, I could persuade the local head-man to assist me in getting a night's rest, I presented myself at the gate of the fort, a square walled inclosure of no strength, and demanded admittance. After much palavering with the sleepy sentry, I was let in past the outer wall, but not into the inner part; whereupon, I asked that the head-man should be sent for, and further clamoured for a chair. Seated upon this, and curiously scrutinised by a few promiscuous hill-folk, I waited for some five minutes, wondering why nobody came. At last a gate in the inner wall was thrown open, and out poured a procession, lit with torches, and headed by an evidently high-class native in flowing white robes. After the interchange of salaams, this individual, who subsequently turned out to be the tehsildar

(administrator of a district), said to me with much humility: 'Is your honour sent by the government to see if troops can be encamped on our hills?'

I admitted the soft impeachment; and whereupon the tehsildar smiled benignly, and a succession of happy grunts and 'It is *hes*, ran round the rest of the assembly, who had grouped themselves in an admiring circle round my chair.'

'Ah, your honour, we are made very happy by seeing you! The Deputy Commissioner of Simla wrote to our rajah to say that you and two other sahibs were coming; but we feared you had gone by another way.'

This was gratifying, but not to the purpose. I accordingly explained to my friend my situation, begged him to discourage the metal-workers, and asked that my servants when they arrived might be directed to my whereabouts. At this, consternation reigned on every side, and the tehsildar nearly fainted.

'Your honour sleep under a tree!' he gasped. 'It is not to be thought of. I have given orders for a banquet to be prepared for your honour; and your sleeping-room is by this time ready. Will your honour be pleased to come and see it?'

I followed the obsequious tehsildar, and inspected my proposed sleeping apartment, a small room, with no outlet but the door, and literally stuffed with carpets, quilts, and pillows, evidently collected hurriedly for the occasion. What pleased me most was the sight of a bed, which I at once ordered to be brought out into a sort of inner veranda, not wishing to be wholly suffocated. I then did justice to the 'banquet' as a man who had trudged some five-and-twenty miles over a difficult country might reasonably be expected to do. The surroundings were rather oppressive, and the civilities of my host and his companions rather overwhelming; but I was not in a mood to be critical, and it was with considerable self-satisfaction I eventually sought my couch, falling asleep almost simultaneously.

The next morning, I prepared to start on another march, and again I had an interview with the tehsildar and the rest of the garrison. I could not help noticing that though the man was perfectly polite and obliging, there was a change in his demeanour and in that of his following. No more was my every movement watched with eager curiosity, no more was my every mouthful accompanied by beaming smiles and grunts of satisfaction. This did not distress me greatly, but I thought it curious, and when I had said farewell and had fairly started on my journey, I asked my servant what it all meant.

The man smiled, and explained: 'Deputy Commissioner Sahib he write to rajah this place and say: "Very great general and two other sahibs coming see your country. Government want put soldiers in your country when hot time comes. Good for you if government do this, because government pay you well, and country getting plenty rich." Rajah he very pleased, and write to all his tehsildars and say: "When great general sahib comes, you make plenty show and big dinner." Last night you come to fort, and it rather dark; tehsildar he

not see very well, and he think you be very great general. This morning come, he see you not general, and he plenty sorry such big dinner make!

WHAT GOES TO THE MAKING OF A SILK GOWN.

VISITORS to the International Exhibition at Edinburgh who have watched with wonder and admiration the deft fingers of the silk-winder as she winds the delicate straw-coloured threads from the cocoon, may be interested to know something of the rise and progress of the manufacture of this, the most beautiful and costly of all our textile fabrics.

The spinning of silk was first discovered in China, and is supposed to have been practised there almost two thousand eight hundred years before the birth of Christ. A Chinese empress, See-ling, a native of India, is said to have discovered, probably by accident, that those wonderful cocoons which the silkworm prepares for its transformation might be pressed into the service of man in the same way as cotton and flax are. She unravelled the delicate fibres, and found them to be strong, though fine, and capable of being woven into a web. Prosecuting her researches, she learned how to breed and rear the worms so as to obtain an abundant supply of cocoons; and in this way initiated a new industry, which the empresses who succeeded her delighted to foster.

For a long time the weaving of silk was in the hands of the court ladies; then, by slow degrees, it passed from rank to rank, until it became the favourite occupation of all classes of women. It was introduced into Europe by way of Constantinople; and in 527 A.D., in the reign of Justinian, it had become so far common that garments of silk were the favourite wear of the Byzantine nobles. The origin and manufacture of this beautiful fabric seem, however, to have been very imperfectly understood, until two monks who had travelled through India and China astonished the emperor and his court by informing them that the shining silk garments which they admired so much owed their existence in the first place to the labours of a small worm. Justinian, like many crowned heads, was often in want of money, and it occurred to him, as he listened to the travellers' wonderful tales, that if he could introduce the manufacture of this costly cloth into his dominions, it would be a sure and increasing source of revenue. Thus judging, he offered the two monks a large reward if they would procure for him a supply of the eggs of this wonderful creature. The monks undertook the commission; and after much difficulty, succeeded in procuring a few ounces of the eggs of the silkworm moth. This treasure, which they had not obtained without danger, they hid in two hollow canes which they used as staffs. One of these precious staffs was lost; but the other was safely presented to Justinian;

and the supply of eggs so curiously procured laid the foundation of a flourishing silk manufacture.

This, which was at first a close monopoly, guarded with the most jealous care, gradually became extended to other countries, as wave after wave of conquest swept over the Eastern Empire. One of these conquerors, Roger, king of Sicily, in 1140 transported a whole colony of silk-weavers, with a plentiful supply of eggs, from Constantinople to Palermo, where, for many centuries afterwards, a great manufacture of silk flourished. It was not until nearly a hundred years after the Sicilian king's invasion of Constantinople that the enterprising citizens of Genoa and Venice succeeded in procuring a supply of the coveted eggs, and very soon made their countries famous for the manufacture of silk. In 1300, the velvets of Genoa were renowned throughout Europe; but there was always an attempt, more or less, to make the manufacture of silk a monopoly; and it was not until nearly two hundred years after the Italian cities had become famous centres of the silk industry, that the manufacture was introduced into France. When it did come, it was, as in the case of Roger of Sicily, in the train of a conqueror. Francis I., while pursuing his conquests in the north of Italy, became aware of the wealth and importance of this branch of industry, and succeeded, partly by bribery, partly by force, in planting colonies of silk-weavers in Lyons, Avignon, and Tours. In all these cities it flourished greatly in a short time, particularly in Lyons, which speedily became one of the centres of the silk-manufacture throughout Europe.

In England, James I. made an effort to introduce it; but, in spite of his fostering care, it did not at first take kindly to the soil, and, in fact, never thrived until it was re-introduced by the Huguenot refugees who were driven from France by the revocation of the Edict of Nantes. Under their care it became for a short time very prosperous, and England bade fair to rival either Italy or France; but the trade was from the first a close monopoly, from which all outsiders, either foreigners or natives, were jealously excluded. The consequence of this was that there was no improvement; the manufacture stood still in England, while in France it was making gigantic strides. It was in vain that successive acts of parliament were enacted to foster and encourage it; it continued to decline until 1824, when it was at last freed from the swaddling bands which had so long impeded all free growth and progress. It has, however, been found impossible to recover as yet our lost ground, and the great proportion of the silk used in this country still comes from France. In the year 1877, our import of silk amounted to £12,631,822, of which by far the greater amount came from France. France, indeed, at this moment far surpasses, in the production of silk, any other country in the world, the annual value of this manufacture being about thirty millions. Many causes have been at work in France to produce this result, one of which is undoubtedly the attention paid to technical education, and the extent to which it is taken advantage of by both men and women.

There are two distinct systems under which, across the Channel, this important manufacture

is carried on. Around Lyons, the trade is in the hands of small practical manufacturers, who have risen by dint of industry and skill from the ranks of workmen. These men set up in business for themselves, but not in any large way; they do not employ many hands, and often themselves work harder than any of their assistants. These hands, both male and female—for women are employed as largely as men—can and do receive instruction at a very cheap rate, and from the best masters, at one or other of the *Écoles de Théorie* of Lyons. There the whole process and the best modes of silk manufacture are exhaustively taught. Chemistry and the arts of colouring silk, with the drawing and designing of patterns, are included in the lessons. This system of small manufacturers, who board in their own families the apprentices whom they train to their trade, was once general throughout France; but within the last fifty years it has in many districts been superseded by another, known as the Convent Factory system. It sprang up first among the Jura Mountains at the small village of Jujurieux. A native of the village, a poor lad, had worked at Lyons as an apprentice in the establishment of one of the small master manufacturers so common there. By dint of industry and intelligence, Jean Bonnet soon became a master himself, and entering into contracts with important Parisian houses, in course of time accumulated a large fortune. Returning to his native place, he found it as he had left it, ugly, decaying, and wretchedly poor, and resolved to raise it to prosperity. He began by buying a large piece of ground, on which he built a number of pretty cottages, a handsome church, and finally a large factory, in which he resolved to employ only women. He fed, lodged, and clothed the poor girls whom he received into his employment, paid them small wages, and taught them the art of silk-weaving along with the rudiments of education. At the beginning of his enterprise, he had many difficulties to contend with; his pupils in the first instance often preferred the rough work of the fields; but he persevered with his experiment until he had conquered all obstacles, and made Jujurieux prosperous, and his system a success. The girls, the native material out of which he formed his workwomen, became, by the aid of a select body of nuns whom he had enlisted in his service, famous throughout France for their good conduct and respectability.

The success of this first convent factory led to the establishment of many others, which with varying fortunes still continue to be worked very much on the same principle. Not all were so successful as that of Jujurieux; but many have been so to a great degree, and there are now three large factories conducted on this principle in the south of France. Sometimes nuns are employed as teachers, but not invariably so; in many instances their place is taken by female superintendents expert at the trade. These women, like the small master manufacturers, often display the kindest interest in those under their charge; and if they see a girl exceptionally clever and intelligent, will make no inconsiderable personal sacrifices to enable her to perfect herself in the higher branches of the industry by becoming a designer of new mate-

rials, of patterns, and combinations of colour, such as are rigidly demanded with every successive season by the uncompromising tyranny of Fashion.

THE GREAT SHIP-CANAL OF CORINTH.

This work, which, cutting through the Isthmus of Corinth, will be of sufficient depth and width to allow of the passage of large vessels, is making rapid progress, employing at present about one thousand men. The quantity of earth to be excavated will be about twelve million cubic feet, and of this, about two and a half millions have already been removed. The depth of the canal is proposed to be twenty-six feet; and the width at the surface of the water will be seventy-two feet, except at the entrance, where it will be about three times that width. The water is already admitted to a distance of sixteen hundred feet into the land at each end, the depth being nearly seventeen feet. It is confidently estimated that the canal will be accomplished in about five years from the present time, judging by the rate at which it is being carried on. It will be an eminently useful work when completed, and one calculated to save much valuable time, by enabling ships to go through the Isthmus, instead of having to sail round the Morea in order to pass from east to west, or from west to east—a circumstance that must carry its own importance in the commercial and maritime world.

'NONE WILL MISS THEE'

Few will miss thee, Friend, when thou
For a month in dust hast lain.
Skillful hand, and anxious brow,
Tongue of wisdom, busy brain—
All thou wert shall be forgot,
And thy place shall know thee not.

Shadows from the bending trees
O'er thy lowly head may pass,
Sighs from every wandering breeze
Stir the long, thick, churchyard grass—
Wilt thou heed them? No: thy sleep
Shall be dreamless, calm, and deep.

Some sweet bird may sit and sing
On the marble of thy tomb,
Soon to flit on joyous wing
From that place of death and gloom,
On some bough to warble clear;
But these songs thou shalt not hear.

Some kind voice may sing thy praise,
Passing near thy place of rest,
Fondly talk of 'other days'—
But no throb within thy breast
Shall respond to words of praise,
Or old thoughts of 'other days.'

Since so fleeting is thy name,
Talent, beauty, power, and wit,
It were well that without shame
Thou in God's great book wert writ,
There in golden words to be
Graven for eternity.

THE GREEK GYPSIES AT LIVERPOOL.

TOWARDS the middle of last July, the people of Liverpool were surprised by the advent of a large band of Greek gypsies, ninety-nine in number, whom the London train had left stranded on a vacant space of ground beside the railway station. Though spoken of as 'Greek' gypsies, they were really from all parts of the Græco-Turkish corner of Europe, and some even from Smyrna and its neighbourhood. But they preferred to be regarded as Greeks, and all of them spoke the modern Greek tongue. They had come to Liverpool, intending to take an early steamer to New York; but their progress was here suddenly arrested; and their stay in Liverpool proved to be of longer duration than had been anticipated by themselves or by others. From their first squatting-ground beside the station they had early been removed to a secluded corner at Walton, within the grounds of the Zoological Gardens. But how long they must yet remain there, and what was to be done with them, seemed difficult problems.

It was not the fault of these strange emigrants that they thus halted on the outward verge of Europe. They had honestly paid their way hither from their Mediterranean home, and they had enough money among them to pay for their passage across the Atlantic. But at this point America interfered. Ready as she once was to welcome all immigrants with open arms, America has become less hospitable of recent years. She has excluded the Chinaman, for racial reasons; and now she is drawing the line at the 'pauper,' of whatever race, because of his poverty. It is not many years since Longfellow apostrophised *Driving Cloud*, 'chief of the mighty Omawhaws,' telling him it was in vain that he and his meagre tribe 'claimed the soil for their hunting-grounds.'

While down-trodden millions
Starve in the garrets of Europe, and cry from its caverns
that they, too,
Have been created heirs of the earth, and claim its
division!

But times are changed. And the European 'pauper' finds no resting-place on North American soil, but is sent back to his old hopeless existence in the garrets and 'caverns' of Europe. It is only the self-supporting immigrant that receives a welcome. There is nothing unnatural in this attitude of the Americans. A young and ambitious country does not want its ranks to be recruited from the idle, unenergetic, and criminal classes of older states; indeed, half the troubles of America have come, not from the descendants of the men who founded the Republic, but from the heterogeneous invaders of the present century. Thus, the American attitude is intelligible enough. Nevertheless, the mere fact that the poor are not permitted to seek a home in that vast country, forms a grim commentary on the popular conception of America as the great haven of refuge for all the victims of Old-world tyrannies.

It must be confessed that the appearance of the gypsy camp at Walton was not at all suggestive of the ideal emigrant; so that it was perhaps as well that the present writer conceived the idea of visiting them without any intention of advocating their claim to such a title. The scene, truly, did not suggest any such qualities as cleanliness, industry, or wealth. Scattered along two sides of an open grassy triangle stood the gypsy tents, some fifteen or twenty—small-sized, mean, and dingy, loosely put together, constructed of old canvas or sacking, which fell on either side of a low ridge-pole, and was closed at one end. In the open space between the two rows of tents a group of gypsy men were amusing themselves—some wrestling and fighting playfully; while the others looked on, talking, laughing, and smoking. A few female figures were moving about among the tents; and a host of children, of all sizes, scampered, toddled, and tumbled over the grass, as happy as if they had never breathed a milder air than that of this chilly English summer day.

One glance at the swarthy faces of these people was enough to convince one that their claim to be called 'gypsies' did not rest upon the mere fact

that they were nomads by habit and tinkers by trade, but that they were the little-mixed representatives of a distinct racial type. A closer examination did reveal the presence of an infusion of white blood among a few of them; but nearly all were the darkest of all dark-skinned Europeans. In no degree whatever did their tawny complexion result from long exposure to wind and sun; for, when one glanced at the skin which their half-open shirts disclosed, or at the bodies of the ill-clad little creatures everywhere running about, one saw the same uniform dusky hue. The hair of all was jet black; but the colour of their eyes seemed to be invariably of a deep hazel shade, rather than the opaque black that may be seen in the eyes of many people of a fairer skin.

No sooner were their visitors descried, than several young children, and one girl of about seventeen, swooped down on them with pleading cries for money. Strongly resembling the children of our itinerant Italians in their dress and appearance, they were also like them in their appealing tones and in the very words they used. 'Grazia, grazia, deh mi pena [penny], na dona!' were the words they reiterated in various combinations, as they held out their dirty little hands beseechingly for the expected 'pena.' Whether they had become familiar with this Italian patois during their temporary residence in Italy, or whether—as is likelier—they had been always accustomed to it in their homes among the Ionian Islands, it was clearly the favourite form of speech among the younger children. But that they also understood modern Greek became speedily clear, although they were far from appreciating the uses to which that language was put. For on this occasion the writer was accompanied by a Greek gentleman, representing an eminent merchant of Liverpool who had greatly exerted himself on behalf of his otherwise friendless countrymen; and by his instructions, all attempts at begging were sternly suppressed, not only because the thing itself was objectionable, but also because he foresaw that, if indulged in, it would further complicate the position of the gypsies, and counteract his efforts to arouse the sympathy of the American authorities. Accordingly, by a few rapid sentences in Greek, the suppliants were effectually repressed.

As soon as the leading men of the band who were then present—the chief himself had gone into town with two of his followers—understood that one of their visitors was a fellow-countryman, representing their patron, they thronged around him with a hundred questions, gesticulating violently the while; and the burden of their complaint was: 'How long must we remain here?' 'Why should we be detained when our journey is half over?' 'Why will the Americans not let us come?' Their case was really a hard one. Three hundred napoleons had they spent on their journey from Greece—on the clear understanding that they were to obtain a passage across the Atlantic from Liverpool, the money for which they had in their possession. Then came the word that they would not be allowed to land; when immediately the steamship companies unanimously refused to take them as passengers. Nor was Canada a bit more friendly than the States; so that only South America

remained open to them. This, indeed, was where they specially wished to go—among the Southern Europeans and their fellow-gypsies. But a voyage to Brazil means a great deal more money than the short passage to New York. The other alternative held up to them—to return to their native country—they indignantly repelled. They had left it for want of employment, and in the hopes of making more money in the New World; for the reasons, in short, which induce other people to emigrate; and they had no wish to waste their substance on a fruitless journey to and from Liverpool.

Although nomadic gypsies, not very clean in their appearance and ways, it must be remembered that these people were, like many other gypsies, honest craftsmen. Some English gypsies who visited them came away with the impression that they were extremely well skilled in metal-working; and the account given by one of their 'interviewers,' a Roumanian gentleman, quite bears this out. 'Mr —' asked the chief why the tribe thought of going to America, and was answered that they wished to make a living. In Roumania they could 'use the lead' [soldier], and they could make and clean pans [the pans being presumably of copper, since they were noted for their skill in copper-working]. They were also builders, and carried bricks and mortar. They also tilled the soil. . . . From his [Mr —]'s knowledge of their habits in Roumania, he did not think the Americans need fear their advent, as they would strive to earn an honest living.' To all this favourable testimony may be added the statement made by the proprietor of the Garlens, that, so far as he could judge, they were absolutely free from the vice of drunkenness, which was more than he could say of many of the 'roughs' who came to look at them.

The passports which they produced from their pocket-books were seen to be bi-lingual—French and Greek in several instances, French and Roumanian, apparently, in others. One ran in the name of King Milan I. of Serbia. The French designation given to them was that of *chardonnier* (tinker). Their Christian names, detailed in their respective passports, were various—such as Michael (the name of their chief), Constantin, Stefano, and Janka; among the female names were Maria and Ghuri (pron. Gewri). The passports, which had been duly *viséd* by the various consuls, frequently included a considerable number of individuals in each, thus covering one or more families. As already stated, these people came from all parts of Greece and European Turkey—from Corfu on the west, and Smyrna on the east, and also from the principalities of Servia, Bulgaria, and Roumania. Many of them, no doubt, are among the people particularly treated of in Dr Paspatis's well-known work on the Turkish Gypsies.

After their first expressions of indignation and annoyance at their mysterious detention had passed off, these men fell into a pleasant humour, and accepted with gratitude a few cigars which their visitors offered them. They seemed great smokers, both men and women, their favourite pipe being about a foot in length, with a pendulous, elastic tube. On learning that the present writer had come all the way from

'Scozia' (Scotland) to see them, they showed much gratification, to which their chief spokesman at once gave expression in modern Greek through the medium of our interpreter; and, pointing to the freshly-lit cigar at which he was now puffing vigorously, he said with emphasis, '*Bón, bón*;' in this case employing his Italian dialect as likely to be the most intelligible form of speech. This man was quite an accomplished linguist, and could speak Greek, Russian, Roumanian, and two or three other dialects of South-eastern Europe. The curious thing was, that while he seemed rather proud of his attainments, he never once included in his list his own mother-tongue, the speech of the gypsy race. Neither would he admit that he was a 'ziganka,' not for a long time, at any rate; but subsequently, both he and his comrades answered to the name of *Roum*,* and the cigar was no longer *bón*,† but *Lácho*.‡

The Greek gentleman and the visitor from Scozia by this time made a sufficient investigation of the camp. The general effect of the people and their surroundings was undoubtedly disappointing. There was an almost total absence of colour in their attire, which—among the men, at least—was very plain, and had little of a distinctive character about it. One, however, wore a broad leathern belt studded with brass-headed nails, which had something about it suggesting the picturesque; while the fingers of most of the men and women were adorned with many rings. The men wore their hair short, and some had moustaches and beards. There was more that was characteristic about the women. The general hue of their attire was 'sad-coloured,' like that of the men; but one had a red, white-spotted kerchief wound round her head, gypsy fashion; and most of them had necklaces of coral or beads, and large silver coins disposed in strings around their neck and shoulders. Their raven tresses were braided in long plaits, which hung down on either side. But none of these gypsy women could be called handsome, and, indeed, were much inferior to the men in this respect. Among the children, however, there were one or two really pretty faces; one, a little girl of five or six, had quite a refined and sweet expression, as well as regular delicate features. In her case, an exception was made to the stern decree against almsgiving; and it was amusing to see her shy hesitation as, with hanging head, and a side-glance at the gypsy man beside her—who, with many cuffs to right and left, had repressed all attempts at begging—she held out a tiny hand for the offered 'penn,' while her neat little mouth parted smilingly over a row of shining 'ivories.' The children, in fact, who numbered more than fifty, constituted the most attractive feature of the scene; and queer, impish little creatures they were. Even where they had no claims to beauty, they were still inexpressibly droll. Some possessed very little clothing wherewith to hide their small brown bodies. One marched gravely about with nothing on but a dilapidated shirt; while, in the distance, a nurse about eight years old

was seen to pursue and capture a wholly naked little savage of half her age. Something in their serio-comic air and the tumbled-together look of their garments, frequently reminded one of the odd little Bohemians in Callot's etchings.

In one tent lay an old and very dark-skinned, white-haired man. Through some accident, he had lost the use of his legs; but he lay stolidly on the ground, smoking a cigar, indifferent, apparently, to the inquisitive looks of a dozen curious spectators. A baby was lying very still in a heap of swaddling-clothes beside him—'*dying*,' said some of the onlookers, though the mother herself pronounced the illness to be nothing serious.

On leaving the camp, another incident in the checkered life of the sojourners presented itself. Two of their young women—girls, rather—had gone into the streets to do a little 'shopping,' and had attempted to enter a butcher's shop, with intent to purchase; but from the recesses of this booth, suddenly evoked by their appearance, there issued forth what Mr Skimpole would have described as 'the absurd figure of an angry butcher,' who, with furious mien and uplifted arm, drove the poor girls back into the street. Followed by a small crowd of street-children, the two young Roumanian maidens strode along, one with a splendid scowl on her face, as she flashed her angry glances on the jeering *gajózes*.* But a friend and compatriot was at hand. The irate butcher, being questioned, explained that he did not drive them away for any attempted dishonesty, but because he knew, from the previous days' experience, that they had only copper to offer him for meat that was fairly worth some silver. To do him justice, the good butcher began to abate his wrath as soon as he perceived that there was money to be made after all. The girls were recalled, and—a perfect mob of children looking in at door and windows—their aprons were filled with a goodly store of meat, with which they departed in happiness, blessing their kindly benefactor.

This mid-day visit had not been enough for the gentleman from Scozia, who returned the same evening to the camp with a small party, one of the number being a famous 'word-master' of Roumanian.† And now it became apparent that the correctly behaved people of the forenoon, freed from the check of their patron's influence, had dropped the mask, and stood boldly forth in their true colours. Not that they were very bad, even then; but their vice was that of begging. But how to describe that! From entrance to exit it was incessant, clamorous, piteous, and beyond all satisfying. Men, women, children, even babies begged! From every side came the *gracia* formula; and the nearer petitioners would lift and kiss the hem of one's garments. Coppers vanished like smoke. Cigars and cigarettes were eagerly accepted on all sides, even by mere children. Nay, so free from shame were the supplicants, that, perceiving whence one of the ladies drew her store of cigarettes—thoughtfully laid in for their benefit—one of the young gypsies quietly thrust his hand into the folds of the dress and drew out

* *Roum* or *Rom*, the gypsies' own name for a gypsy all the world over.

† *Lácho*, otherwise *lácho*, 'good.'

* *Gajózes*, Gentiles or non-gypsies.

† Roumanian, the gypsy language.

the remaining two or three! There was not the slightest attempt at violence or furtive theft; only an incessant, plaintive begging by voice and manner—of the most artistic order, evolved out of the practice of many generations. Although our own gypsies had long ago the reputation of practising this art, it is now quite dissociated from them—in this direct form.

Those English gypsies who had visited them had a good deal to say of their begging propensities. From one they had demanded tobacco to an unlimited extent, from others they had asked for sugar and soap. And while it was amusing to hear our own gypsies express their righteous indignation at the ways of their 'kin beyond sea,' it was very interesting to listen to their remarks upon their common language; for, although very imperfectly indeed, and only in occasional words and phrases, they could understand each other a little—only a little, however, so great are the differences of intonation, inflexion, and vocabulary. Nevertheless, now that those Greeks had revealed themselves in their true character as gypsies, it became clearly evident to their visitors that—unlike their brethren in Montenegro—they still retained the language of their race. In the midst of the tumult and crowd—not only of gypsies but of indiscriminate *galgijos*—it was impossible even for a *báro lávengro** to do more than exchange a few brief sentences with them. But, in that imperfect way, it became clear that this was a camp of true Romanians. *Roum*, or rather *Erroum*, is the form they give to the more common *Rom*, in which peculiarity they resemble the *Erroumans* of the Basque countries. Various words were thus obtained from them, corresponding generally with those which one finds in Dr Paspatis's collection.

But patience has its limits, and a steady and persistent demand for *largesse* cannot be as steadily complied with; so, with words of farewell to the older members of the tribe, who had throughout restrained themselves—and indeed some of the youthful mendicants, who were void of shame—the gypsy camp was left to become an interesting memory.

When these lines were written, the newspapers told of heavy rains and wet bedraggled tents; and further, of a proposal made by an inveterate showman to exhibit the gypsies through the music-halls, with their ancestral games, dances, and craftsmanship. Misguided wanderers from the blue *Ægean*, is there no better fate before you than this?

BY ORDER OF THE LEAGUE.

BY FRED. M. WHITE.

IN TWENTY CHAPTERS.—CHAP. I.

THE shades of evening had commenced to fall; already the slanting sun shining through the open window glittered on the array of crystal glasses, turning the wine within them to a blood-red hue. The remains of an ample dessert were scattered about the bare polished table, rich luscious-looking fruits and juicy pines filling the air with their fragrance. A pleasant room,

* *Báro lávengro*, 'great word-maker,' that is, fluent speaker of the gypsy language.

with its panelled walls and quaint curiosities, with here and there a modern picture framed; and again other works standing upon easels or placed against the wainscot. From the Corso below came the sounds of laughter and gaiety; while within, the delicate scent of the pines was overpowered by the odour of tobacco which rose from the cigarettes of the three men sitting there. They were all young—artists evidently, and from the appearance of one of them, he was of a different nationality from the others. Frederick Maxwell was an Englishman, with a passion for art, and no doubt had he been forced to gain a living by his brush, would have made some stir in the world; but being born with the traditional silver spoon in his mouth, his flirtation with the arts never threatened to become serious. He was leaving Rome in a few days, and the dessert upon the table was the remains of a farewell dinner—that custom dear to every English heart. A handsome fair-haired man this Englishman, his clear bright cheek and blue eyes contrasting with the aquiline features and olive-hued complexion of his companions. The man with the black moustache and old velvet painting-jacket, a man with holchemian stamped on him indelibly, was Carlo Visci, also an artist, and a genius to boot, but cursed with that indomitable idleness which is the bane of so many men of talent. The other and slighter Italian, he with the melancholy face and earnest eyes, was Luigi Salvarini, independent as to means, and possessed, poor fool! with the idea that he was ordained by Providence for a second Garibaldi.

There is an infinite sense of rest and comfort, the desire to sit silent and dream of pleasant things, that comes with tobacco after dinner, when the eye can dwell upon the waxlights glittering on glass and china, and on the artistic confusion the conclusion of the repast produces. So the three men sat listlessly, idly there, each drowsily engaged, and none caring to break the delicious silence, rendered all the more pleasing from the gay girlish laughter and the trip of little feet coming up from the Corso below. But no true Briton can remain long silent; and Maxwell, throwing his cigarette out through the window, rose to his feet, yawning. 'Heigh-ho! So this pleasant life is come to an end,' he exclaimed. 'Well, I suppose one cannot be expected to be always playing.'

Carlo Visci roused himself to laugh gently. 'Did you ever do anything else, my friend?' he asked. 'You play here under sunny skies, in a velvet painting-jacket; then you leave us to pursue the same arduous toil in the tall hat of Albion's respectability, in the land of fogs and snows. Ah! yes, it is only a change of venue, my philosopher.'

'Not now,' Salvarini corrected gravely. 'Remember, he has vowed by all in his power to aid the welfare of the League. That vow conscientiously followed out is undertaking enough for one man's lifetime.'

'Luigi, you are the skeleton at the feast,' Visci remonstrated. 'Cannot you be happy here for one brief hour without reminding us that we are bound by chains we cannot sever?'

'I do not like the mocking tone of your words,' Salvarini replied. 'The subject is too earnest for jesting upon.—Surely, Maxwell, you have not so

soon forgotten the solemnity of the oath you took last night?'

'I do remember some gibberish I had to repeat, very much like the conspirators' chorus at the Opera,' Maxwell returned with a careless shrug. 'It is not bad fun playing at sedition.—But for goodness' sake, Luigi, do not keep harping on the same string, like another Paganini, but without the wizard's versatility.'

'You think it play, do you?' Salvarini asked almost scornfully. 'You will find it stern reality some day. Your hour may not come yet, it may not come for years; but if you are ordered to cut off your right hand, you will have to obey.'

'Oh, indeed. Thanks, most earnest youth, for your estimation of my talent for obedience.—Come, Luigi! do not be so Cassandra-like. If the worst comes to the worst, I can pitch this thing into the Tiber.' He took a gold coin from his pocket as he spoke, making a gesture as if to throw it through the open lattice.

Salvarini stood up, terror written in every line of his face, as he arrested the outstretched arm. 'For heaven's sake, Maxwell, what are you thinking of? Are you mad, or drunk, that you can dream of such a thing?'

Maxwell laughed as he restored the coin to his pocket. 'All right, old fellow. I suppose I must honour your scruples; though, mind you, I do not consider myself bound to do anything foolish even for the League.'

'You may not think so; indeed, I hope not; but time will tell.'

Maxwell laughed again, and whistled carelessly, thinking no more of the little episode. The League, the coin, everything was forgotten; but the time did come when he in his hour of need remembered Luigi's words, and vividly realised the meaning of the look on his stern earnest face.

Visci looked on at the incident, totally unmoved, save by a desire to lead the conversation into more pleasant channels. 'When do you leave, Maxwell?' he asked. 'I suppose you are not going for a few days?'

'In about a week probably, not sooner. I did not know I had so many friends in Rome, till I was going to leave them.'

'You will not forget your visit to my little place? Genevieve will never forgive me if I let you go without saying good-bye.'

'Forget little Genevieve!' Maxwell cried. 'No, indeed. Whatever my engagements may be, I shall find time to see her; though, I daresay, the day will come when she will forget me easily enough.'

'I am not so sure of that; she is a warm-hearted child. I tell you what we will do; and perhaps Sir Geoffrey and his daughter will join us. We will go down the day after to-morrow, and make a day of it.—Of course you will be one, Luigi?'

It was growing dark now, too dark to see the rich flush that mounted to the young Italian's cheek. He hesitated a moment before he spoke. 'With pleasure, Carlo. A day at your little paradise is not to be lightly refused. I will come gladly.'

'You make a slight mistake, Visci, when you speak of Genevieve as a child,' Maxwell observed reflectively. 'She is seventeen—a woman, according to your Italian reckoning. At any rate, she

is old enough to know the little blind god, or I am much mistaken.'

'I hope not,' Visci returned gravely. 'She is quick and passionate, and somewhat old for her years, by reason of the seclusion she keeps. But let the man beware who lightly wins her heart; it would go hard with him if I crossed his path again!'

'There are serpents in every paradise,' Maxwell replied sententiously; 'and let us hope little Gen. is free from the curiosity of her original ancestress. But child or not, she has a woman's heart worth the winning, in which assertion our silent friend here will bear me out.'

Luigi Salvarini started from his reverie. 'You are right, Maxwell,' he said. 'Many a man would be proud to wear her gaze upon his arm. Even I.—But why ask me? If I was even so disposed to rest under my own fig-tree, there are ties which preclude such a blissful thought.'

Maxwell whistled softly, and muttered something about a man drawing a bow at a venture—the words audible to Salvarini alone.

'I am tied, as I told you,' he continued coldly. 'I do not know why you have drawn me into the discussion at all. I have sterner work before me than dallying by a woman's side looking into her eyes'—

'And not anything like so pleasant, I dare swear,' Maxwell interrupted cheerfully. 'Come, Luigi; do not be so moody. If I have said anything in my foolish way to offend you, I am heartily sorry.'

'I am to blame, Maxwell, not you. You wonder why I am so taken up with this League; if you will listen, I will tell you. The story is old now; but I will tell you as best I can remember.'

'Then, perhaps you will wait till I have found a seat and lighted my cigarette,' exclaimed a voice from the background at this moment. 'If Salvarini is going to oblige, I cut in as a listener.'

At these words, uttered in a thin, slightly sneering voice, the trio turned round suddenly. Had it been lighter, they would have seen a trim, well-built figure, with head well set on square shoulders, and a perfectly cut, deadly pale face, lighted with piercing black eyes, and adorned by a well-waxed, pointed moustache. From his accents, there must have been something like a sneer upon his lips. But whatever he might have been, he seemed to be welcome enough now as he drew a chair to the open window.

'Better late than never,' Maxwell cried. 'Help yourself to wine, Le Gautier; and make all due apologies for not turning up to dinner.'

'I will do so,' the new-comer said languidly. 'I was detained out of town.—No; you need not ask if a pair of bright eyes were the lodestars to my ardent soul, for I shall not tell you; and in the second place, I have been obtaining your permit as a Brother of the League. I offered up myself on the shrine of friendship; I lost my dinner, *voilà tout*;' and saying these words, he put a narrow slip of parchment in Maxwell's hands.

'I suppose I had better take care of this!' the Englishman answered carelessly. 'I got so exasperated with Salvarini, that I came near

pitching the sacred moldere out of the window. I presume, it would not be wise?'

'Not if you have any respect for a sound body,' Le Gautier returned dryly. 'I gather that Luigi has been talking largely about the sacredness of the mission. Well, he is young yet, and the gilt of his enthusiasm does not yet show the nickel beneath, which reminds me. Did my ears deceive me, or were we going to hear a story?'

'It is no story,' the Italian replied, 'merely a little family record, to show you how even patriots are not exempt from tyranny.—You remember my brother, Visci? and his wife. He settled down, after fighting years for his country, not many miles from here. Living with him was his wife's father, an aged man, universally beloved—a being who had not a single enemy in the world. Well, time went on, till one day, without the slightest warning, the old fellow was arrested for compliance in some so-called plot. My brother's wife clung round her father's neck; and there, in my brother's sight, he saw his wife stricken brutally down by the ruffianly soldiers—dead; dead, mind—her only crime that little act of affection—killed by order of the officer in charge. But revenge followed. Paulo shot three of the scoundrels dead, and left the officer, as he thought, dying. Since then, I have never heard of Paulo.—And now, do you wonder why I am a Socialist, with my hand against all authority and order, when it is backed up by such cowardly, unprovoked oppression as this?'

For a time the listeners remained silent, watching the twinkling stars as they peeped out one by one, nothing to be seen now of each but the glowing tip of his cigarette as the blue smoke drifted from the casement.

'You do not think that your brother and Paulo Lucci, the celebrated brigand we hear so much of, are the same men?' Visci asked at length. 'People have said so, you understand.'

'I have heard such a tale,' Salvarini replied sardonically. 'The affair created quite a stir in the province at the time; but the peasants do me too much homage in connecting my name with so famous a character. Our Italian imagination does not rest at trifles.'

'Pleasant for the officer who ordered them to strike down your brother's wife,' Le Gautier drawled, as he emitted a delicate curl of smoke from his nostrils. 'Did you ever hear the name of the fellow?'

'Curiously enough, his name is the same as yours, though I cannot be sure, as it is five years ago now. He was a Frenchman, likewise.'

'Moral!—let all Le Gautiers keep out of Paulo Lucci's way,' Maxwell exclaimed, rising to his feet. 'We do not pay you the compliment of believing you are the same man; but these brigands are apt to strike first and inquire after. Of course, this is always presuming Salvarini's brother and Paulo Lucci are one.—I am going as far as the Villa Salvarino. Who says ay to that proposal?—The ayes have it.'

They rose to their feet with one accord, and after changing their coats for something more respectable, trooped down the stairs.

'You will not forget about Friday?' Visci

reminded. 'I shall ask Sir Geoffrey and his daughter to come. We are going down to my little place on that day.—Will you make one, Le Gautier?'

'A thousand thanks, my dear Visci,' the Frenchman exclaimed; 'but much as I should like it, the thing is impossible. I am literally overwhelmed in the most important work.'

A general laugh followed this solemn assertion.

'I am sorry,' Visci returned politely. 'You have never been there. I do not think you have ever seen my sister?'

'Never,' Le Gautier replied with an inexplicable smile. 'It is a pleasure to come.'

AN ATLANTIC VOYAGE—AS IT WAS AND AS IT IS.

WHEN Samuel Johnson said, 'A ship is a prison with a chance of being drowned,' he in that aphorism gave expression to the opinion generally entertained by landsmen in his day. In fact, the discomforts, and even privations, which sea-travelling then involved were such that very few persons were willing to expose themselves to them, save when compelled by imperative circumstances to do so.

When I crossed the Atlantic in 1841, for the first time, the condition of things had, in the three-quarters of a century which had elapsed since Johnson's time, measurably improved; but the *disagréments* to which passengers were even then subjected were numerous. No regular steam communication between Great Britain and the United States was in existence. The *Sirius* and the *Great Western* had indeed crossed the ocean in 1838, and the latter vessel had continued her trips at irregular intervals. But for some little time subsequently, no other steamer attempted to follow her example, the Cunard line not having been established until 1842.

At the period of which I speak, the sailing packets which ran between London and New York, and between Liverpool and that port, were ships of five to six hundred tons burden. The staterooms—as the little cabins ranged on either side of the saloon were termed—were below the sea-level. They were incommodious, dark, and ill ventilated. In fact, the only light they enjoyed was that furnished by small pieces of ground glass inserted in the deck overhead, and from the fan-lights in the doors opening to the saloon, and this was so poor, that the occupants of the staterooms could not even dress themselves without making use of a lamp. The sole ventilation of them was that afforded by the removal of the saloon skylights, which, of course, could only be done in fine weather. The consequence was that the closeness of the atmosphere in the staterooms was at all times most unpleasant; whilst the smell of the bilge-water was so offensive as to create nausea, independent of that arising from the motion of the vessel. In winter, on the other hand, the cold was frequently severe. There was, it is true, a stove in the saloon, but the heat from it scarcely made itself appreciably felt in the side-cabins.

In other matters there was the same absence of provision for the comfort of the passengers. The

fresh water required for drinking and cooking purposes was carried in casks; and when the ship had a full cargo, many of these were placed on deck, with the result that their contents were sometimes impregnated with salt water from the waves shipped in heavy weather. At all times, the water was most unpalatable, it being muddy, and filled with various impurities from the old worn-out barrels in which it was kept. Not only was the water bad, but the supply occasionally proved inadequate; and when the voyage was an unusually long one, the necessity would arise of placing the passengers upon short allowance.

There was always a cow on board; but there was no other milk to be had than what she supplied, no way of preserving it having then been discovered. Canned fruit and vegetables were equally unknown. There was commonly a fair provision of mutton and pork, live sheep and pigs being carried; but of other fresh meat and of fish, the stock was generally exhausted by the time the vessel had been a few days at sea, refrigerators at that period not having been invented.

But the arrangements on board these ships were defective in much more important matters than in not providing a good table for the passengers. The boats—even when they were seaworthy, which frequently was not the case—were so few in number that, in the event of shipwreck, there was no possibility of their holding more than a third of the souls on board. The longboat, indeed, was practically useless in an emergency, as it was almost invariably filled up with sheds for the accommodation for the cow, sheep, and pigs; and it would have been several hours' work to clear the boat and launch her.

The law did not then render it compulsory for every vessel crossing the Atlantic to carry a surgeon, and the owners of the various lines of American packets would not incur the expense of providing one. The consequence was that, if an accident occurred or there was serious illness on board, no medical assistance was available. When I was returning to Europe in the *Mediator* in 1842, a sailor fell from one of the yards, badly fracturing his right leg. The commander of the vessel was a Yankee—that is, a native of one of the New England States—and he had the ingenuity and readiness of resource which are characteristic of the people of that section of the Union. He so admirably set the injured limb with splints, that, when the ship arrived at London and the man was taken to Bartholomew Hospital, the officials of that institution highly complimented Captain Morgan upon the workmanlike manner in which he had performed the operation. The fact, however, remains, that but for the purely fortuitous circumstance of the commander of the vessel having been able to deal with the case, the result of there being no surgeon on board must have been that the injured man would either have died, or been a cripple for life.

If the cabin passengers had good cause to complain that neither their safety nor their comfort was sufficiently studied, the condition of the steerage passengers was infinitely worse. Men, women, and children were huddled like sheep in the quarters assigned them, no separation of

the sexes being attempted. The berths, which ran on either side of the vessel, were not inclosed, and were without curtains. The women were compelled to dress and undress before the eyes of the male passengers, and exposed to their coarse remarks and scurrilous jests. Indeed, the moral downfall of many a poor girl was to be attributed to her feelings of decency and modesty having been blunted by her painful experiences during the voyage.

The steerage passengers were required to both supply and cook their own provisions. There was commonly a fierce struggle for a place at the galley fire, in which the sick and feeble necessarily went to the wall; and sometimes several days would pass without any warm food being obtained by those who were most in need of it. Again, when there was a storm, or even when the ship experienced heavy weather, the hatches were closed, rendering the atmosphere of the steerage almost stifling. In fact, the condition and treatment of this class of passengers were simply abominable, and such as to reflect deep discredit upon the government for allowing so many years to elapse ere any attempt was made to deal with the evil.

Now, all is changed. The steamers which at the present day cross the Atlantic are vessels ranging from four to seven thousand tons burden; and the arrangements on board of them are excellent in all respects. Besides the lifeboats—which are numerous, large, and built on the most approved models—there are rafts which, in case of necessity, can be got ready and launched in a few minutes. In the event, too, of a fire breaking out in any part of the ship, the appliances for extinguishing it are of the most thorough character. In fact, the provision made for the safety of the passengers would be all that could be desired if every ship carried a sufficient number of boats to accommodate, in case of disaster, every passenger, even when her complement was full. Note the late disaster to the *Oregon*.

The comfort of the travelling public is now carefully studied. The cabins for the first-class passengers are placed amidships, where the motion of the vessel is least felt, instead of, as formerly, at the stern. The staterooms are commodious, handsomely furnished, thoroughly ventilated, and heated by steam. The saloon, which is spacious and well lighted, contains a piano, a small library, bagatelle tables, chess, &c., for the use of the passengers. There are also smoking and reading rooms and bathrooms, supplied with hot as well as cold water. The table is so luxuriantly spread that there is scarcely a delicacy which can be obtained in the best hotels in London, found lacking on board these steamers. The supply of fresh water—furnished by condensers—is practically unlimited; whilst that which is required for drinking purposes is in summer cooled with ice, of which a large stock is provided. A surgeon is invariably carried, the law rendering it obligatory to do so; and his services are at the disposal of any of the passengers who needs them without the payment of any fee.

Nor have the steerage passengers failed to participate in the altered condition of things. Instead of their being crowded together in the badly ventilated and unhealthy quarters assigned to them, as was formerly the case, it is now

pitching the sacred moidore out of the window. I presume, it would not be wise!

'Not if you have any respect for a sound body,' Le Gautier returned dryly. 'I gather that Luigi has been talking largely about the sacredness of the mission. Well, he is young yet, and the gilt of his enthusiasm does not yet show the nickel beneath, which reminds me. Did my ears deceive me, or were we going to hear a story?'

'It is no story,' the Italian replied, 'merely a little family record, to show you how even patriots are not exempt from tyranny.—You remember my brother, Visci? and his wife. He settled down, after fighting years for his country, not many miles from here. Living with him was his wife's father, an aged man, universally beloved—a being who had not a single enemy in the world. Well, time went on, till one day, without the slightest warning, the old fellow was arrested for compliance in some so-called plot. My brother's wife clung round her father's neck; and there, in my brother's sight, he saw his wife stricken brutally down by the ruffianly soldiers—dead; dead, mind—her only crime that little act of affection—killed by order of the officer in charge. At all times, the water was most unpalatable, it being muddy, and filled with various impurities from the old worn-out barrels in which it was kept. Not only was the water bad, but the supply occasionally proved inadequate; and when the voyage was an unusually long one, the necessity would arise of placing the passengers upon short allowance.

There was always a cow on board; but there was no other milk to be had than what she supplied, no way of preserving it having then been discovered. Canned fruit and vegetables were equally unknown. There was commonly a fair provision of mutton and pork, live sheep and pigs being carried; but of other fresh meat and of fish, the stock was generally exhausted by the time the vessel had been a few days at sea, refrigerators at that period not having been invented.

But the arrangements on board these ships were defective in much more important matters than in not providing a good table for the passengers. The boats—even when they were seaworthy, which frequently was not the case—were so few in number that, in the event of shipwreck, there was no possibility of their holding more than a third of the souls on board. The longboat, indeed, was practically useless in an emergency, as it was almost invariably filled up with sheds for the accommodation for the cow, sheep, and pigs; and it would have been several hours' work to clear the boat and launch her.

The law did not then render it compulsory for every vessel crossing the Atlantic to carry a surgeon, and the owners of the various lines of American packets would not incur the expense of providing one. The consequence was that, if an accident occurred or there was serious illness on board, no medical assistance was available. When I was returning to Europe in the *Meditator* in 1842, a sailor fell from one of the yards, badly fracturing his right leg. The commander of the vessel was a Yankee—that is, a native of one of the New England States—and he had the ingenuity and readiness of resource which are characteristic of the people of that section of the Union. He so admirably set the injured limb with splints, that, when the ship arrived at London and the man was taken to Bartholomew Hospital, the officials of that institution highly complimented Captain Morgan upon the workmanlike manner in which he had performed the operation. The fact, however, remains, that but for the purely fortuitous circumstance of the commander of the vessel having been able to deal with the case, the result of there being no surgeon on board must have been that the injured man would either have died, or been a cripple for life.

If the cabin passengers had good cause to complain that neither their safety nor their comfort was sufficiently studied, the condition of the steerage passengers was infinitely worse. Men, women, and children were huddled like sheep in the quarters assigned them, no separation of

the sexes being attempted. The berths, which ran on either side of the vessel, were not inclosed, and were without curtains. The women were compelled to dress and undress before the eyes of the male passengers, and exposed to their coarse remarks and scurrilous jests. Indeed, the moral downfall of many a poor girl was to be attributed to her feelings of decency and modesty having been blunted by her painful experiences during the voyage.

The steerage passengers were required to both supply and cook their own provisions. There was commonly a fierce struggle for a place at the galley fire, in which the sick and feeble necessarily went to the wall; and sometimes several days would pass without any warm food being obtained by those who were most in need of it. Again, when there was a storm, or even when the ship experienced heavy weather, the hatches were closed, rendering the atmosphere of the steerage almost stifling. In fact, the condition and treatment of this class of passengers were simply abominable, and such as to reflect deep discredit upon the government for allowing so many years to elapse ere any attempt was made to deal with the evil.

Now, all is changed. The steamers which at the present day cross the Atlantic are vessels ranging from four to seven thousand tons burden; and the arrangements on board of them are excellent in all respects. Besides the lifeboats—which are numerous, large, and built on the most approved models—there are rafts which, in case of necessity, can be got ready and launched in a few minutes. In the event, too, of a fire breaking out in any part of the ship, the appliances for extinguishing it are of the most thorough character. In fact, the provision made for the safety of the passengers would be all that could be desired if every ship carried a sufficient number of boats to accommodate, in case of disaster, every passenger, even when her complement was full. Note the late disaster to the *Oregon*.

The comfort of the travelling public is now carefully studied. The cabins for the first-class passengers are placed amidships, where the motion of the vessel is least felt, instead of, as formerly, at the stern. The staterooms are commodious, handsomely furnished, thoroughly ventilated, and heated by steam. The saloon, which is spacious and well lighted, contains a piano, a small library, bagatelle tables, chess, &c., for the use of the passengers. There are also smoking and reading rooms and bathrooms, supplied with hot as well as cold water. The table is so luxuriantly spread that there is scarcely a deficiency which can be obtained in the best hotels in London, found lacking on board these steamers. The supply of fresh water—furnished by condensers—is practically unlimited; whilst that which is required for drinking purposes is in summer cooled with ice, of which a large stock is provided. A surgeon is invariably carried, the law rendering it obligatory to do so; and his services are at the disposal of any of the passengers who needs them without the payment of any fee.

Nor have the steerage passengers failed to participate in the altered condition of things. Instead of their being crowded together in the badly ventilated and unhealthy quarters assigned to them, as was formerly the case, it is now

compulsory for a fixed cubic space to be allotted to each individual. Not only, too, are the berths inclosed—which is greatly conducive to the preservation of decency—but the single women occupy a separate compartment, in the charge of a matron. But one of the greatest improvements which has taken place in the condition of occupants of the steerage has been effected by the Act, passed a few years ago, requiring cooked provisions being found by the owners of the ship; and although the passage-money is necessarily higher than it was under the old system, this drawback is more than compensated by the comfort which results from the present arrangement.

In conclusion, I may say that, indulging in a retrospect upon my experiences for the last forty years—during which period I have crossed the Atlantic ten times—I have been forcibly struck by the contrast the peril, tedium, and inconveniences then attendant upon an Atlantic voyage afford to the safety, rapidity, and comfort with which it is now accomplished.

IN ALL SHADES.

CHAPTER XLIV.

NEXT morning, Tom Dupuy, Esquire, of Pimento Valley, Westmoreland, Trinidad, mounted his celebrated chestnut pony Samba Gal at his own door, unchained his famous Cuban bloodhound Slot from his big kennel, and rode up, with comsily and lover-like anxiety, to Orange Grove, to inquire after Nora's and her father's safety. Nora was up by the time he reached the house, pale and tired, and with a frightful headache; but she went to meet him at the front door, and dropped him a very low old-fashioned obeisance.

'Good-morning, Tom Dupuy!' she said coldly. 'So you've come at last to look us up, have you? It's very good of you, I'm sure, very good of you. They tell me you didn't come last night, when half the gentlemen, from all the country round rode up (in hot haste with guns and pistols to take care of papa and me. But it's very good of you, to be sure, now the danger's well over, to come round in such a friendly fashion and drop us a card of kind inquiries.'

Even Tom Dupuy, born boor and fool as he was, flushed up crimson at that galling taunt from a woman's lips, 'Now that the danger's well over.' To do him justice, Tom Dupuy was indeed no coward; that was the one solitary vice of which no fighting Dupuy that ever lived could with justice be suspected for a moment. He would have faced and fought a thousand black rioters single-handed, like a thousand fiends, himself, in defence of his beloved vacuum pans and dearly cherished saccharometers and boiling-houses. His devotion to molasses would no doubt have been proof against the very utmost terrors of death itself. But the truth is that exact devotion in question was the real cause of his apparent remissness on the previous evening. All night long, Tom Dupuy had been busy rousing and arming his immediate house-servants, despatching messengers to Port-of-Spain for the aid of the constabulary, and preparing

to defend the cut canes with the very last drop of his blood and the very last breath in his stolid body. At the first sight of the conflagration at Orange Grove, he guessed at once that 'the niggers had risen;' and he proceeded without a moment's delay to fortify roughly Pimento Valley against the chance of a similar attack. Now that he came to look back calmly upon his heroic exertions, however, it did begin to strike him somewhat forcibly that he had perhaps shown himself slightly wanting in the affection of a cousin and the ardour of a lover. He bit his lip awkwardly for a second, with a sheepish look; then he glanced up suddenly and said with clumsy self-vindication: 'It isn't always those that deserve the best of you that get the best praise or thanks, in this world of ours, I fancy, Nora.'

'I fail to understand you,' Nora answered with quiet dignity.

'Why, just you look here, Nora: it's somehow like this, I tell you plainly. Here was I last night down at Pimento. I saw by the blaze that these nigger fellows must have broken loose, and must be burning down the Orange Grove cane-houses; so there I stopped all night long, working away as hard as I could work—no nigger could have worked harder—trying to protect your father's canes and the vacuum pans from these murdering, howling rebels. And now, when I come round here this morning to tell you, after having made sure the whole year's crop at old Pimento, one of your fine English flouts is all the thanks I get from you, miss, for my night's labour.'

Nora laughed—laughed in spite of herself—laughed aloud a simple, merry, girlish laugh of pure amusement—it was so comical. There they had all stood last night in imminent danger of their lives, and of what is dearer than life itself, surrounded by a frantic, yelling mob of half-demented, rum-maddened negroes—her father left for dead upon the piazza steps, Harry Noel hacked with cutlasses before her very eyes, herself trampled under foot in her swoon upon the drawing-room floor by the naked soles of those negro rioters—and now this morning, Cousin Tom comes up quietly when all was over to tell her at his ease how he had taken the most approved precautions for the protection of his beloved vacuum pans. Every time she thought of it, Nora laughed again, with a fresh little outburst of merry laughter, more and more vehemently, just as though her father were not at that very moment lying within between life and death, as still and motionless as a corpse, in his own bedroom.

There is nothing more fatal to the possible prospects of a suitor, however hopeless, than to be openly laughed at by the lady of his choice at a critical moment—nothing more galling to a man under any circumstances than patent ridicule from a beautiful woman. Tom Dupuy grew redder and redder every minute, and stammered and stuttered in helpless speechlessness; and still Nora looked at him and laughed, 'for all the world,' he thought to himself, 'as if I were just nobody else but the clown at the theatre.'

But that was not indeed the stage on which Tom Dupuy really performed the part of clown

with such distinguished success in his unconscious personation.

'How's your father this morning?' he asked at last gruffly, with an uneasy shuffle. 'I hear the niggers cut him about awfully last night, and next door to killed him with their beastly cutlasses.'

Nora drew herself up and checked her untimely laughter with a sudden sense of the demands of the situation, as she answered once more in her coldest tone: 'My father is getting on as well as we can expect, thank you, Mr Tom Dupuy. We are much obliged to you for your kind inquiries. He slept the night pretty well, all things considered, and is partially conscious again this morning. He was very nearly killed last night, as you say; and if it hadn't been for Mr Noel and Mr Hawthorn, who kindly came up at once and tried to protect us, he would have been killed outright, and I with him. But Mr Noel and Mr Hawthorn had happily no vacuum pans and no trash-houses to engage their first and chief attention.'

'Tom Dupuy sneered visibly. 'Hm!' he said. 'Two coloured fellows! Upon my conscience! the Dupuys of Trinidad must be coming down in the world, it seems, when they have to rely for help in a nigger rising upon two coloured fellows.'

'If they'd had to rely upon white men like you,' Nora answered angrily, flushing crimson as she spoke, 'they'd have been burnt last night upon the ashes of the cane-house, and not a soul would have stirred a hand or foot to save them or protect them.'

Tom laughed to himself a sharp, short, malicious laugh. 'Ha, ha!' he said, 'my fine English-bred lady, so that's the way the wind blows, is it? I may be a fool, and I know you think me one!—Nora bowed immediately a sarcastic acquiescence—but I'm not such a fool as not to see through a woman's face into a woman's mind like an open window. I heard that that woolly-headed Hawthorn man had been over here and made a most cowardly time-serving speech to the confounded niggers, giving way to all their preposterous demands in the most outrageous and ridiculous fashion; but I didn't hear that the other coloured fellow—your fine-spoken English friend Noel—he hissed tho words out with all the concentrated strength of his impotent hatred—'had been up here too, to put his own finger into the pie when the crust was burning. Just like his impudence! the conceited coxcomb!'

'Mr Noel is lying inside, in our own house here, this very moment, dangerously wounded,' Nora cried, her face now like a crimson peony; 'and he was cut down by the negroes last night, standing up bravely, alone and single-handed, with no weapon but a little riding-whip, facing those mad rebels like an angry tiger, and trying to protect me from their insults and their cutlasses; while you, sir, were stopping snugly away down at Pimento Valley, looking carefully after your canes and your vacuum pans. Tom Dupuy, if you dare to say another word, now or ever, in my hearing against the man who tried to save my life from those wild wretches at the risk of his own, as sure as I'm standing here, sir, I give you fair notice I'll chastise you

myself, as soon as I'll look at you, you cowardly backbiter!—And now, Mr Dupuy, good-morning.'

Tom saw the game was fairly up and his hand outwitted. It was no use arguing with her any longer. 'When she's in this humour,' he said to himself philosophically, 'you might as well try to reason with a wounded lioness.' So he whistled carelessly for Slot to follow, lifted his hat as politely as he was able—he didn't pretend to all these fine new-fangled town-bred ways of Harry Noel's—jumped with awkward agility upon his chestnut pony, turned its head in the direction of Pimento Valley, and delivered a parting Parthian shot from a safe distance, just as he got beyond the garden gateway. 'Good-by, Miss Nora,' he said then savagely, raising his hat a second time with sarcastic courtesy: 'good-bye for ever. This is our last meeting. And remember that I always said you'd finish in the end, for all your fine English education, in marrying a confounded woolly-headed brown man!'

CHAPTER XLV.

All day long, Mr Dupuy lay speechless and almost motionless on his bed, faint with loss of blood, and hovering between life and death, but gradually mending by imperceptible degrees, as Marian fancied. The brain had been terribly shaken, and there were some symptoms of stunning and concussion; but the main trouble was merely the excessive drain on the vascular system from the long-continued and unchecked bleeding. About mid-day, he became hot and feverish, with a full pulse, beating unsteadily. Macfarlane, who had remained in the house all night, ordered him at once a rough mixture of sal-volatile, bismuth, and whisky. 'And whatever ye do,' he said emphatically, 'don't forget the whisky—a good wine-glassful in half a pint of cold water.'

Mr Dupuy was raised in the bed to drink the mixture, which he swallowed mechanically in a half-unconscious fashion; and then a bandage of pounded ice was applied to his forehead, and leeches were hastily sent for to Port-of-Spain to reduce the inflammation. Long before the leeches had time to arrive, however, Nora, who was watching by his bedside, observed that his eyes began to open more frequently than before, and that gleams of reason seemed to come over them every now and again for brief intervals. 'Give him some more whisky,' Macfarlane said in his decided tone; 'there's nothing like it, nothing like it—in these cases—especially for a man of Dupuy's idiosyncrasy.'

At that moment Mr Dupuy's lips moved feebly, and he tried to turn with an effort on the pillow.

'Hush, hush!' Nora cried; 'he wants to speak. He has something to tell us. What is it he's saying? Listen, listen!'

Mr Dupuy's lips moved again, and a faint voice proceeded slowly from the depths of his bosom: 'Not fit to hold a candle to old Trinidad rum, I tell you, doctor.'

Macfarlane rubbed his hand against his thigh with evident pleasure and satisfaction. 'He's wrong there,' he murmured, 'undoubtedly wrong; as every judicious person could easily tell him;

but no matter. He'll do now, when once he's got life enough left in him to contradict one. It always does a Dupuy good to contradict other people. Let it be rum, then—a wins-glassful of Mr Tom's best stilling.'

Almost as soon as the rum was swallowed, Mr Dupuy seemed to mend rapidly for the passing moment. His looked up and saw Nora. 'That's well then,' he said with a sigh, recollecting suddenly the last night's adventures. 'So they didn't kill you after all, Nora!'

Nora stooped down with unwonted tenderness and kissed him fervently. 'No, papa,' she said; 'they didn't; nor you either.'

Mr Dupuy paused for a moment; then he looked up a second time, and asked, with extraordinary vehemence for an invalided man: 'Is this riot put down? Have they driven off the niggers? Have they taken the ringleaders? Have they hanged Delgado?'

'Hush, hush!' Nora cried, a little appalled in her cooler mood, after all that had happened, at this first savage outcry for vengeance. 'You mustn't talk, papa; you mustn't excite yourself. Yes, yes; the riot is put down, and Delgado—Delgado is dead. He has met with his due punishment.'

'That's well!' Mr Dupuy exclaimed, with much gusto, in spite of his weakness, rubbing his hands feebly underneath his bedclothes. 'Serves this villain right. I'm glad they've hanged him. Nothing on earth comes up to martial law in these emergencies; and hang 'em on the spot, say I, as fast as you catch 'em, red-handed! Flog 'em first, and hang 'em afterwards!'

Marian looked down at him speechless, with a shudder of horror; but Nora put her face between her hands, overwhelmed with awe, now her own passion had hurst itself out, at that terrible outburst of the old bad barbaric spirit of retaliation. 'Don't let him talk so, dear,' she cried to Marian. 'O Marian, Marian, I'm so ashamed of myself! I'm so ashamed of us all—us Dupuys, I mean; I wish we were all more like you and Mr Hawthorn.'

'You must not speak, Mr Dupuy,' Macfarlane said, interposing gently, with his rough-and-ready Scotch tenderness. 'Ye're not strong enough for conversation yet, I'm thinking. Ye must just take a wee bit sleep till the fever's reduced. Ye've had a narrow escape of your life, my dear air; and ye must not excite yourself the minute ye're getting a trifle better.'

The old man lay silent for a few minutes longer; then he turned again to Nora, and without noticing Marian's presence, said more vehemently and more viciously than ever: 'I know who set them on to this, Nora. It wasn't their own doing; it was coloured instigation. They were put up to it—I know they were put up to it—by that scoundrel Hawthorn—a seditious, rascally, malevolent lawyer, if ever there was one. I hope they'll hang him too—he deserves it soundly—flog him and hang him as soon as they catch him!'

'O papa, papa!' Nora cried, growing hotter and redder in the face than ever, and clutching Marian's hand tightly in an agony of distress and shamefacedness, 'you don't know what you're saying! You don't know what you owe

to him! It was Mr Hawthorn who finally pacified and dispersed the negroes; and if it hadn't been for his coolness and his bravery, we wouldn't one of us have been alive to say so this very minute!'

Mr Dupuy coughed uneasily, and muttered to himself once more in a vindictive undertone: 'Hang him when they catch him!—hang him when they catch him! I'll speak to the governor about it myself, and prove to him conclusively that if it hadn't been for this fellow Hawthorn, the niggers'd never have dreamed of kicking up such a hullabaloo and bobbery!'

'But, papa, Nora began again, her eyes full of tears, 'you don't understand. You're all wrong about it. If it hadn't been for that dear, good, brave Mr Hawthorn—'

Marian touched her lightly on the shoulder. 'Never mind about it, Nora, darling,' she whispered consolingly, with a womanly caress to this poor shrinking girl at her elbow; 'don't trouble him with the story now. By-and-by, when he's better, he'll come to hear the facts; and then he'll know what Edward's part was in the whole matter. Don't distress yourself about it, darling, now, after all that has happened. I know your father's feelings too well to take amiss anything he may happen to say in the heat of the moment.'

'If you speak another word before six o'clock, to-night, Dupuy,' Macfarlane put in with stern determination, 'I'll just clear every soul that knows ye out of the room at once, and leave you alone to the tender mercies of old Aunt Clemmy. Turn over on your side, man, when your doctor tells ye to, and try to get a little bit of refreshing sleep before the evening.'

Mr Dupuy obeyed in a feeble fashion; but he still muttered doggedly to himself as he turned over: 'Catch him and hang him! Prove it to the governor!'

As he spoke, Edward beckoned Marian out into the drawing-room through the open door, to show her a note which had just been brought to him by a mounted orderly. It was a few hasty lines, written in pencil, that very morning by the governor himself, thanking Mr Hawthorn in his official capacity for his brave and conciliatory conduct on the preceding evening, whereby a formidable and organised insurrection had been nipped in the bud, and a door left open for future inquiry, and redress of any possible just grievances on the part of the rioters and discontented negroes. 'It is to your firmness and address alone,' the governor wrote, 'that the white population of this island of Trinidad owes to-day its present security from fire and bloodshed.'

Meanwhile, preparations had been made for preventing any possible fresh outbreak of the riot that evening; and soldiers and policemen were arriving every moment at the smouldering site of the recent fire, and forming a regular plan of defence against the remote chance of a second rising. Not that any such precautions were really necessary; for the negroes, deprived of their head in Delgado, were left utterly without cohesion or organisation; and Edward's promise to go to England and see that their grievances were properly ventilated had had far more effect upon their trustful and excitable natures

than the display of ten regiments of soldiers in marching order could possibly have produced. The natural laziness of the negro mind, combining with their confidence in the young judge, and their fervent faith in the justice of Providence under the most apparently incongruous circumstances, had made them all settle down at once into their usual listless *laissez-faire* condition, as soon as the spur of Delgad's fiery energy and exhortation had ceased to stimulate them. 'It all right,' they chattered passively among themselves. 'Mistah Hawthorn gwine to 'peak to Missis Queen fur de poor naygur; an' de Lard in hebben gwine to watch ober him, an' see him don't suffer no more wrong at de heavy hand ob de proud bukra.'

When the time arrived to make preparations for the night's watching and nursing, Nora came to Marian once more with her spirit vexed by a sore trouble. 'My dear,' she said, 'this is a dreadful thing about poor Mr Noel having to go on stopping here. It's very unfortunate he couldn't have been nursed through his illness at your house or at Captain Castello's. He'll be down in bed for at least a week or two, in all probability; and it won't be possible to move him out of this until he's better.'

'Well, darling?' Marian answered, with an inquiring smile.

'Well, you see, Marian, it wouldn't be so awkward, of course, if poor papa wasn't ill too, because then, if I liked, I could go over and stop with you at Mulberry until Mr Noel was quite recovered. But as I shall have to stay here, naturally, to nurse papa, why—'

'Why, what then, Nora?'

Nora hesitated. 'Why, you see, darling,' she went on timidly at last, 'people will say that as I've helped to nurse Mr Noel through a serious illness—'

'Yes, dear?'

'O Marian, don't be so stupid! Of course, in that case, everybody'll expect me—to—to—accept him.'

Marian looked down deep into her simple, little, girlish eyes with a curious smile of arch womanliness. 'And why not, Nora?' she asked at last with perfect simplicity.

Nora blushed. 'Marian—Marian—dear Marian,' she said at length, after a long pause, 'you are so good—you are so kind—you are so helpful to me. I wish I could say to you all I feel, but I can't; and even if I did, you couldn't understand it—you couldn't fathom it. You don't know what it is, Marian, to be born a West Indian with such a terrible load of surviving prejudices. O darling, darling, we are all so full of wicked, dreadful, unjust feelings! I wish I could be like you, dear, I wish indeed I could; but I can't, I can't, I can't, somehow!'

Marian stroked her white little hand with sisterly tenderness in perfect silence for a few minutes; then she said, rather reproachfully: 'So you wish Mr Noel wasn't going to be nursed under your father's roof at all, Nora! That's a very poor return, isn't it, my darling, for all his bravery and heroism and devotion?'

Nora drew back like one bitten suddenly by a venomous creature, and putting her hand in haste on her breast, as if it pained her terribly, answered, with a little deep-drawn sigh: 'It

isn't that, Marian—it isn't that, darling. You know what it is, dear, as well as I do. Don't say it's that, my sweet; oh, don't say it's that, or you'll kill me, you'll kill me with remorse and anger! You'll make me hate myself, if you say I'm ungrateful. But I'm not ungrateful, Marian—I'm not ungrateful. I admire, and—love him; yes, I love him, for the way he acted here last evening.' And as she spoke, she buried her head fervidly, with shame and fear, in Marian's bosom.

Marian smoothed her hair tenderly for a few minutes longer, this time again in profound silence, and then she spoke once more very softly, almost at Nora's ear, in a low whisper. 'I went this morning into Mr Noel's room,' she said, 'darling, just when he was first beginning to recover consciousness; and as he saw me, he turned his eyes up to me with a beseeching look, and his lips seemed to be moving, as if he wanted ever so much to say something. So I stooped down and listened to catch the words he was trying to frame in his feverish fashion. He said at first just two words—"Miss Dupuy;" and then he spoke again, and said one only—"Nora." I smiled, and nodded at him to tell him it was all well; and he spoke again, quite audibly: "Have they hurt her? Have they hurt her?" I said: "No; she's as well as I am!" and his eyes seemed to grow larger as I said it, and filled with tears; and I knew what he meant by them, Nora—I knew what he meant by them. A little later, he spoke to me again, and he said: "Mrs Hawthorn, I may be dying; and if I die, tell her—tell Nora—that last night, when she stood beside me there so bravely, I loved her, I loved her better even than I had ever loved her!" He won't die, Nora; but still I'll break his confidence, darling, and tell it you this evening.—O Nora, Nora! you say you wish to goodness you hadn't got all these dreadful, wicked, West Indian feelings. You're brave enough—I know that—no woman braver. Why don't you have the courage to break through them, then, and come away with Edward and me to England, and accept poor Mr Noel, who would gladly give his very life a thousand times over for you, darling?'

Nora burst into tears once more, and nestled, sobbing, closer and closer upon Marian's shoulder. 'My darling,' she cried, 'I'm too wicked! I only wish I could feel as you do!'

SWIMMING.

THE extent to which the power of swimming is cultivated amongst Englishmen is scarcely creditable to the citizens of a country which boasts both that it is the greatest naval power, and that it possesses infinitely the largest mercantile marine on the face of the earth. It is only within recent years that it has been anything but a rare exception for a sailor to be able to swim. Amongst old naval officers it is still remembered as a notable occurrence that some fifty years ago, Lord Ingestre, when in command of a ship on the Mediterranean station, refused to rate as an able seaman any man who could not swim, and that from time to time other captains followed his example. That this should be still recalled

to mind shows how rare an accomplishment swimming was amongst sailors in past times; and if this has now been remedied in the royal navy, where, at the present day, swimming is taught, a similar improvement has by no means taken place in the mercantile marine, in which a seaman who can swim is still a curiosity. Probably the same remark would apply to our 'long-shore' population, to our lightermen and professional watermen, and to the inhabitants of our numerous canal-boats. And yet English people of both sexes and of the average type seem to take to the water as naturally as a duck. The difference is that they delight to disport themselves on the waves instead of in them. Every seaport, every suitable stretch of river, every lake, has its Rowing Club; Cockneys, whose ideas of rowing are original if not elegant, and whose notions of boat-management constitute a minus quantity, make summer Sundays and the August Bank Holiday hideous on the Thames in the neighbourhood of Hampton Court; and if 'Arry takes his 'Arriet for a day's excursion to some one of the seaside resorts which they patronise, the enjoyment of both is incomplete if they do not court the woes of sea-sickness by going for a sail.

In face of this national taste for aquatic pursuits, it is a painfully suggestive reflection that comparatively few Englishmen, and still fewer Englishwomen, possess sufficient knowledge of swimming to save their own lives if they were suddenly plunged into deep water, and were called upon to support themselves for, perhaps, five minutes by their own exertions. No doubt, the power of swimming is a far more common accomplishment amongst men than it was a quarter of a century ago. Swimming has shared in the athletic revival which has marked the period, and has found its devotees amongst the practical adherents of muscular Christianity; but if, as some seem to think, there are not wanting signs that the rage for athletic pursuits has passed its meridian, and has begun its decline, swimming will probably suffer, in common with other sports, from the reaction. No doubt, too, our changeful English climate, our cold waters, are against this particular form of exercise. In the tideless, sun-warmed Mediterranean, in the coral-bound lagoons of the Southern Ocean, or by the grove-clad banks of Burmese rivers, swimming becomes both a luxury and a second nature. Let those testify who remember the untrammelled urchins flinging themselves from the bows of boats in Malta harbour to dive for and secure the coins flung from the deck of some newly arrived vessel, or disporting themselves day after day in the fetid, drain-polluted waters of the Dockyard Creek. Let travellers bear witness who, with possibly some humorous exaggeration, have told us how, in Burmah, toddling infants can swim at least as soon as they can walk; and how a mother, too busy for the time to look after her youngest born, will cheerfully and confidently place it in the river, to amuse itself with its playmates; and then, when she has leisure, will swim about among the gamboling children until she has found her own and brought it to land. In such a case as this there can be but little teaching; swimming must come almost naturally—shall we say from

hereditary instinct, developed by the constant calls made upon it, and transmitted from generation to generation?

The lower temperature of the sea, or of fresh water fully exposed to the air, in our latitudes will doubtless always prevent Englishmen, as a nation, from becoming expert swimmers; but the common-sense of a people which prides itself on its possession of the quality should suffice to evade or overcome this natural obstacle so far as to release us from at least a large proportion of the grim death-tribute which we pay every year to our national ignorance. To any one who has noted the characteristic recklessness with which people intrust themselves to frail craft with whose management they are ludicrously unacquainted, it may perhaps be a matter for surprise that this tribute is not more heavy than it is; but certainly not a few of the deaths by drowning that go to swell our annual calendar of disasters can only be properly called accidents if we extend the signification of the word so as to include those misfortunes which, though unforeseen, arise from perfectly preventable causes. The climate of Paris and the north of France is not warmer than that of England, but the proportion of Parisians—perhaps even of Frenchmen in general—who can swim is certainly greater than that of Englishmen. When it was pointed out to the librarian at Boulogne-sur-Mer that the library did not possess a single work on swimming, he replied good-humouredly: 'Ah! c'est comme ça, Monsieur—on apprend naturellement ici;' and in Thévenot's *Art de Nager, démontré par Figures, avec des Ais pour se baigner utilement*, published in Paris in or about 1696, some of the plates represent ladies swimming, and would thus seem to show that with Frenchwomen it has been a custom for centuries. In the year 1859, Miss Powers, the secretary to the Ladies' National Association for the diffusion of sanitary knowledge, published a twopenny pamphlet entitled, *Why do not Women Swim?—a Voice from many Waters*; but the question thus propounded was not satisfactorily answered, and an Englishwoman who can swim still remains a rarity—how great a one, any one may easily ascertain for himself by watching the small crowd that speedily assembles to watch a lady-swimmer at any seaside resort.

In extenuation of our national ignorance of swimming, we have not even the excuse that the acquisition of the art is difficult. On the contrary, it is one of the most easily acquired of accomplishments. The one secret of it is confidence, though, like most other things, it is best learned young. There is no reason why it should not—on the contrary, on the ground both of health and of saving of life, there is every reason why it should—be made a necessary part of the education of young people of both sexes and of all classes. At Eton and in some other schools, it is systematically taught; but it would be far cheaper and more useful than many of the things for which parents cheerfully pay as 'extras' in private establishments; whilst in these days, when we are concerning ourselves so greatly about the education of the masses, and paying such a price for the privilege, swimming would certainly be a far more useful subject to form one of the items of Board School education than many of

the things for which the long-suffering ratepayer is now compelled to put his hand in his pocket. As a certain William Woodbridge remarked in a manual published by him in 1864 :

To swim with ease and confidence and grace,
Should in Great Britain have acknowledged place
Of recognition ; and by law decreed,
It's taught as fully as we're taught to read ;
Forming a part in education's rule
In every college and in every school.

This is the merest doggerel. In fact, the recommendation of the book is not its literary merit, for it possesses none, but the fact that it is what it professes to be—in itself a matter of congratulation after the nonsense which, from time to time, it has been sought to palm off upon the public by utilising the names of various prominent swimmers who were far too signorant to have written a line of the compilations with which their names have been associated—and that the instruction conveyed in it is thoroughly sound, practical, and to the point. Woodbridge died in 1868 ; and the little manual has, I believe, been long out of print, so that in saying this I may be acquitted of the desire to give any one a gratuitous advertisement. I come back, however, to my point : Why, provided there be water at hand, should not every one be taught to swim during the period of his or her school career ; and how can parents reconcile it to their consciences to permit their children to run a perfectly needless risk, by failing to have them taught what they ought to learn as regularly and easily as they learn to walk ?

A TALE OF TWO KNAVERIES.

IN FOUR CHAPTERS.—CHAP. II.

TOM and Lucy Wedlake were two young people who had loved one another well enough, and had had sufficient courage to marry on two hundred pounds a year in the teeth of their respective families, both of which were highly respectable, extremely proud, but very poor. Tom was a Civil Service clerk, aged twenty-eight, whose salary had reached the above annual sum ; and it was insisted by all their relations that the young people ought to wait until he should get his first class—which he might hope to do about forty—and be in receipt of three hundred a year ; that being the smallest income upon which any lady and gentleman could contrive to support existence together. The pair declined to accept this view ; so they got married ; and Tom took his pretty gentle wife to live in a little house on the north-east of the Regent's Park, which he had furnished with money lent him, free of interest, by a well-to-do friend. For the rest, they were content to trust to youth, health, and determination to keep from absolute destitution themselves and any little folks who might hereafter come.

They did not, after all, find the struggle so terrible as it had been described to them. They were not blessed—or burdened—with children until they had been some time married, nor

until circumstances had put it into their power to maintain and educate them without difficulty ; and they had no expensive tastes. They were extremely fond of one another, and lived in great happiness for one year. Then Uncle Franklin took up his abode with them, and their happiness was for a time considerably clouded. Mr Franklin was Lucy's maternal uncle. In his business—that of a wine-merchant—he had made money, which he had increased by successful speculation. But in proportion as his purse grew bulky, his manners deteriorated. The latter fact was forgiven in consideration of the former ; and by the time he retired, the master of a moderate fortune, the family toleration of him had developed into positive affection. Yet he was as we have seen him—rough, harsh, coarse, selfish, and overbearing ; faults which were easily overlooked by the half-dozen sets of brothers and sisters, plentifully garnished with nephews and nieces, who remembered only that Uncle Franklin was old, rich, and a bachelor, and forgot the wine-merchant's business, and the continual sunbs and insults which it had always been the old gentleman's pleasure to inflict upon his affectionate relatives. So that, when he began to lament the loneliness of his age, and to hint at his longings for the comforts and pleasures of family life, quite a number of hospitable doors flew open to him on the instant. Uncle Franklin entered all those doors, and left each of them before many weeks were over, shaking the dust off his feet against the inhabitants. In every house which he honoured with a brief sojourn, he comported himself more like a fiend than a human being. His selfishness, his ill-temper, his insolence, his coarseness, his tyranny, his general powers of exasperation, would have been unendurable by any save possible legatees, whose meekness, however, instead of disarming the old savage, seemed to incite him to yet greater cruelties. The end was the same in every case. He would fasten some perfectly unreasonable quarrel upon his hosts, and sling out of the house in a furious passion ; subsequently amusing himself by inditing from his next abode injurious replies to the petitions for pardon and reconciliation which pursued him.

One day a cab drove up to Tom Wedlake's door, and Uncle Franklin, alighting therefrom, walked into the parlour, plumped himself into the most comfortable armchair, and announced his intention of remaining, adding that his luggage would arrive shortly. Lucy, in consternation, entertained him as well as she could, which did not appear to be very well, until her husband came home and they were able to take counsel together.

Tom was at first entirely opposed to the whole thing ; and being himself of a somewhat fiery temper, hinted at forcible expulsion as a means of solving the difficulty. But Lucy begged him to do nothing hastily, and suggested that the self-invited guest might at all events remain for a few days, until they should be able to see for themselves whether he were in reality so black as he

had been painted. And whether it was the excellence of the little dinner which Lucy dished up, or the bright though homely comfort around him, or certain indications in Tom's look and manner, the dreadful uncle, having come in like a lion, seemed disposed to remain in the character of a lamb. He actually tried, in the course of the evening, to pay Lucy a compliment on her good looks, which only missed fire because no one could possibly have understood it.

Before he went to bed, Uncle Franklin repented his proposal, offering very liberal terms; and he lamented his lonely old age and the evident disposition of all his relatives to quarrel with him, in a way which went to Lucy's soft heart. Even Tom, than whom there was no better fellow breathing, was taken in so far that he forgot much that he had heard of the woes attending Uncle Franklin's intrusion into any household. It so happened that he had never troubled Lucy's own family circle, who alone of all his relatives lived at some distance from London. The young couple sat late that night, discussing the matter from all sides, and at last determined to make the trial. Lucy was influenced partly by pity, partly by the hope, which had in it little indeed of the mercenary element, that her uncle might leave her some small legacy, so that her darling husband might not, after all, have an altogether undowered bride. Tom, on his side, thought only of the wife he loved; the additional income would enable her to keep another servant, would relieve her from hard and menial labour, and would even afford her some few little feminine luxuries which had hitherto been beyond her reach. So each, for the other's sake, was willing to howl back for the burden.

For a time all went well. The old man seemed to have made a sudden and vast amendment. True, he was generally irritable, always selfish, and sometimes expressed himself in rather odd language. But these, after all, were mere eccentricities, failings of old age, results of a life apart from all refining influences. They were not insupportable by two people who had youth, health, and good spirits to their aid. And it was evident that Uncle Franklin had taken a fancy to his niece. He liked to have her sitting near him at work; and she made an exemplary listener while he fought over again the battles of business, or indulged in tirades against the baseness and ingratitude of mankind in general and his other relations in particular. To Tom he was civil, and even friendly after his fashion; altogether, he was an endurable inmate; and his entertainers began to believe that the tales which they had heard must at least have been highly coloured.

But after a month of this, Tom and Lucy began to discover that very little present advantage was likely to result to them from this arrangement, which was also irksome in many ways. Uncle Franklin paid well; but then his ideas on the subjects of eating and drinking and minor luxuries were on an even more liberal scale. In fact, after his requirements in this way were provided for, and the expense of the necessary additional servant met, there was little or no margin of profit remaining. And the demands upon Lucy's time and energies were consider-

able. Uncle Franklin liked attention, and was unsparing in exacting it; he was, in truth, something of an invalid, which perhaps partly accounted for his temper and other peculiarities; so that Tom began to think seriously of hinting to his guest that it was hardly convenient to entertain him longer; when one evening the old man, being alone with his host and in an unusually equable frame of mind, made an explicit declaration of his intentions. Having first anathematised all his other relations in a general but very hearty manner, he vowed that his niece and her husband were so far the only people with whom he had been able to get on; that he found himself more comfortable with them than he had ever been in his life; and that, with their permission, he proposed to end his days in their company. Tom looked a little awkward; but Mr Franklin, as if guessing at what was in his mind, went on to say that on this condition he should make Lucy his sole legatee; there being, as he considered, no one who had a better claim upon him, or to whom he would willingly leave a fraction of his wealth. Of course Tom could only express his grateful acknowledgments. He was too poor, his prospects were too uncertain for him to be justified in standing in the light of his wife and possible children; so Uncle Franklin was given to understand that his proposal was accepted.

Lucy was full of delight when her husband told her what had passed; but Tom himself was by no means disposed to be sanguine.

'It's all very well, little woman,' said he; 'and so far he has behaved with tolerable decency. But I don't think he's exactly a person to be trusted. You see, he is very comfortable here, thanks to you, and he is unendlessly selfish. Naturally, he would like to stay; and some men will say or promise anything to get what they want at the moment. Let him stay, by all means; we must not throw away such a chance. But don't allow yourself to build too much on his promises, my dear. I, for my part, shall not be at all surprised if he gets tired of us, and quarrels with us, as he has with the rest; nor even if we find, after he has ended his days here and got all he can out of us, that his money is left elsewhere.'

Lucy said little, but she could not bring herself to believe in the existence of such duplicity, and in her heart she was convinced of her uncle's *bona fides*. She even felt a little shocked that her husband, whom she so loved and admired, could entertain such narrow and unworthy suspicions; and she resolved that, so far as it depended on her, the old man should have no just cause to reconsider his testamentary intentions.

But it is to be feared that this attack of amiability, coupled with the repression of the past few weeks, had put a strain upon Uncle Franklin which he was unable to bear. Perhaps he thought that his munificent promise entitled him to relax a little; perhaps he considered that he had now made his footing in the house absolutely safe. However that may have been, within a very few days after this conversation, the old Adam began to appear in him once more. In Tom's presence, he was still on his good behaviour, having an instinctive fear of him, as one not likely to submit tamely to oppression. But Tom was absent all day at his office; and

when Uncle Franklin had no one to withstand him but a woman, and a very timid and gentle one to boot, he began to 'let himself out.' His powers of fault-finding were perfectly microscopic; he passed his time in devising vexations and enjoying them with the keenest relish. As for his language, it daily increased in majesty and ornament. He spoke to the servants in such a manner that one of them—the new one—threatened to give warning, and was with difficulty persuaded to remain; and Lucy was obliged to keep them as much as possible from contact with her guest. He would begin with a grumble at some trifle, round which he would gradually crystallise his grievances, and work himself up by their contemplation into a condition of insane rage, in which he would amble about the room like an angry hahoon, knocking down chairs and scattering verbal brimstone all around. On these occasions, his liking for Lucy seemed to disappear altogether, and he would indulge in the most unpleasant criticisms on her appearance, her intellect, and her housekeeping abilities. Neither would he spare her husband, whom he was accustomed to sum up with similarly uncomplimentary results, inviting Lucy to report his comments to their object—a course which, he understood very well, nothing would induce her to take.

She bore it all heroically. She knew what the consequence would be if the slightest hint of the treatment to which she was subjected should ever reach Tom's ears; so she contented herself with uncomplaining good-temper so long as that was possible, and tears—which added fuel to her uncle's wrath—when endurance was pushed beyond its limits. Of her own profit she thought little; or rather, the loss of her expectations would have seemed to her humble and contented nature but a small price to pay for release from her sufferings. But for Tom's sake—in the hope of seeing him relieved of that anxiety for her future which she knew to be always present to his mind—for the sake of those who might hereafter cling around her knees—she was prepared to endure silently the worst that Uncle Franklin could do to her.

This state of things, however, came to a sudden end in a manner to her most unwelcome. Her husband came home one afternoon much earlier than usual. He had thought of late that his wife looked rather pale and worn, and had resolved to treat her to a little dinner at a restaurant, and to take her afterwards to the theatre, in the hope that the outing might give her a much-needed fillip. The consequence was that he met her unexpectedly, as she came out of the dining-room. Could she have had a few moments' time, she would have utilised it in sponging her eyes and generally smoothing down her ruffled plumage, for this was one of the days on which she had given way under Uncle Franklin's inflictions; her face was all hlurred with tears, and she was sobbing so that she could not immediately stop. All that he had heard of the old man rushed into Tom's mind, and he suspected at once the state of the case. He took her up-stairs, and then and there had it all out of her, with that gentle and perfectly unbending firmness which she could never resist. He said no more than to bid his

little wife dry her eyes and be comforted, kissed her, and went down-stairs, quite deaf to her feeble efforts to excuse the offender. Uncle Franklin had a bad half-hour of it that afternoon; he probably heard more solid truth than he had been favoured with for many years. It was never exactly known what Tom said to him; but before bedtime that night, it was quite understood by all the household that their guest was under orders to quit within a week. Uncle Franklin did not utter a word all the evening, but sat in his armchair, blinking furtively at his host, feeling guilty and detected, but yet unrepentant. Before he went to bed, he announced his intention of keeping to his own room for the remainder of his stay, and requested that a fire might be lit there in the morning. Also, he wrote a letter, and sent a servant to post it. This letter it was which occasioned Mr Blackford's visit.

That worthy solicitor prepared the will, which was very short and simple, with the care demanded by a document of such importance to his own interests. He even took the precaution to fair-copy it for signature himself, so as to pay strict regard to the desire of the testator that no inkling of its purport should leak out prematurely; and with it he next day repaired to Camden Town, taking with him, as requested, two witnesses—his own clerk, and a writer in the employ of his law-stationer.

Mr Franklin chuckled a great deal as he wrote his name. 'You can take it away and keep it yourself, Blackford,' said he, after the witnesses had done their part and retired; 'I'll warrant you to take good care of it.—By the way, I don't think the date's inserted.'

The solicitor began to unbutton the greatcoat, in an inner pocket of which he had buried the precious piece of paper.

'Oh, bother that! Do it when you get back. It's your concern—not mine. I've had enough of you for one while; and I feel confoundedly queer. I suppose this business has upset me, though I don't know why it should. It wouldn't have done so, once on a time.—Good-day.' And, nothing loth, Mr Blackford took himself off with his treasure.

The prize was his; but only conditionally. This unreliable testator might alter his mind at any moment and undo his freak. Mr Blackford, with all his faults, was not murderously inclined; but it is to be feared that if some burglar in the pursuit of his calling had found it necessary to eliminate Mr Franklin that night, and had confided his intentions beforehand to the solicitor, something would have happened to prevent that gentleman from warning the police. He re-entered his office with a sigh. Never had it appeared to him so gloomy as at this moment, when, with the possibility of future wealth in his pocket, he found himself still confronted with the necessity of solving that difficult and importunate bread-and-cheese problem.

Uncle Franklin had rightly estimated his chances of remaining an inmate of the Wedlake nest. On the morning after the execution of his will, he came down to the dining-room at breakfast-time, and then and there ate humble-pie with the best grace he could assume. He

apologised formally to Lucy, and promised never to repeat his behaviour. He pleaded to Tom his failing health and increasing age, and drew a moving picture of himself as an outcast upon the world, at the mercy of landladies; and he did this with a certain rough pathos which produced its effect. Tom was very short and stern in his replies, and would commit himself to nothing definite, but promised to think the matter over during the day. And when he returned at night, Lucy the soft-hearted met him with an appeal, before which he gave way.

'He has been very humble and quiet all day,' said she. 'I think, my boy—so savage about his little wife!—has quite broken the poor old man's spirit. I don't think we ought to send him away. Of course, there is the money; and it's nonsense to pretend that we shouldn't be glad if he were to leave us a little. We can't afford to despise it, Tom. I am sure he likes me, though he is so cross; and I am not much afraid that this affair will make any difference in the end. But besides all that, he is so friendless and alone, rich as he is.—We will try to keep him, won't we, Tom dear?'

'He must be on his good behaviour, then,' said Tom, only half mollified. 'I'll stand no more nonsense, let him be as rich as Croesus.'

'Leave him to me,' said Lucy; 'there will be no more trouble with him. It was my own fault for giving way so much. I shall be wiser now, and so will he.'

'As you like, dear,' said her husband. 'I have no right to oppose you in this matter, if you are willing to sacrifice yourself. I am very much afraid you will be disappointed. Forgiveness of injuries is not in your dear uncle's nature, or I am much mistaken. He hates me like poison now, of course; and he can't benefit you without doing the same by me, to some extent.'

'I don't know,' returned Lucy thoughtfully. 'I think you will find him very different in future. He seems to me as if he had had a shock. No one has ever stood up to him before, you know; and the treatment may have a good effect.'

It did not occur to either of them to attach any importance to the visits of Mr Blackford, of whose profession they were ignorant. Uncle Franklin, though he had retired from trade, continued his speculative investments; and the calls of gentlemen of unmistakable 'business' appearance were of such common occurrence, that they had almost ceased to attract notice in the household; the master and mistress of which were two of the least curious people in the world.

The old man certainly was altered, suddenly and strangely. His ill-temper had disappeared; he even refrained from swearing when, on one occasion, a mishap in the kitchen rained his lunch. He became remarkably silent; he gave up his morning walk, seldom read his paper, and moped all day in his armchair, following Lucy about the room with his eyes whenever she was present. She was rather anxious about him, and did her best, by redoubled kindness and attention, to soothe what she supposed to be his mortification under the sharp rebuke which he had received. For a long time he scarcely noticed her efforts, remaining sullen and unresponsive; but after

a while she found that he still liked her to be near him, and got restless and uneasy if she were long absent. He seemed to have something on his mind, and would gaze into the fire and mutter anxiously to himself for hours together. For Tom he entertained a hearty and unconcealed aversion, never speaking to him unless obliged to do so, and glaring at him with no doubtful expression whenever his back was turned. Of this Tom was almost oblivious, and entirely careless; for no 'expectations,' however important to himself or to others, could have enabled him to dissemble his real feelings towards any one whom he either loved or disliked.

DREAM-FANCIES.

WHENCE are ye that come to us
In the stilly night?
Wherefore do you torture thus,
Phantoms of delight?
Say, if ye are only fancies,
Why your presence so entrances—
So deceives our sight?

Where, oh, where's your stronghold, tell,
In what fairy land?
O'er what meads of Asphodel
Sport your elfin band?
Tell me truly, sitting fancies,
Where you hold those fairy dances,
On what sunny strand?

When you, with your subtle spell,
Hold our senses fast,
Absent comrades with us dwell,
Present seems the Past;
Say, if ye are idle fancies,
Why, when overpast the trance is,
Its impressions last?

Wherefore bring before us still
Those from whom we sever?
Mean you, that you tyrants will
Grant oblivion never?
Say, if ye are dreams and fancies,
Why in dreams young Cupid's lances
Strike as deep as ever?

Tell me who your power confers,
Say from whom ye borrow
All your magic—harbingers
Usurping joy or sorrow;
Why, if ye're but fickle fancies,
These dream-faces, these dream-glances
Haunt us so to-morrow?

Mortal mind may never know,
Mortal wisdom cite
Whence ye come or whither go,
Spirits of the night:
Yet your mystery enhances,
And your witchery entrances
More than pen may write.

MASSAGE.

A MODE OF MEDICAL TREATMENT.

MASSAGE as a hygienic agent was practised from the earliest times, and is probably as old as surgery itself, or, as it would be more exact to say, as old as mankind. The word is derived from the Greek to knead, and the Arabic to press softly. A Chinese manuscript, the date of which is three thousand years before the Christian era, contains an account of operations similar to those of the present day: friction, kneading, manipulating, rolling—all the procedures now grouped together under the name of *massage*. The translator of this curious record, a French missionary at Peking, finds it to include all the characteristics of an ancient scientific mode of treatment; and it has been wittily remarked, that however it may rejuvenate those who submit to its influence, the wrinkles of time cannot be removed from its own ancient visage.

With the Egyptians, Greeks, and Romans, a form of massage was the common accompaniment of the bath, and was used as a luxury, as a means of hastening tedious convalescence, and to render the limbs supple and enduring. Rubbing and anointing were sometimes done by medical practitioners themselves, or by the priests, or sometimes by slaves. Herodotus, one of the masters of Hippocrates in the fifth century B.C., first proposed gymnastics as a cure for disease. He was the superior officer of the gymnasium at Athens; and by compelling his patients to undergo various exercises and to have their bodies rubbed, is said to have lengthened their lives, inasmuch that Plato reproached him for protracting that existence, in which, as years advanced, they could have less and less enjoyment. He himself, by the practice of his own remedies, attained the age of a hundred.

The earliest definite information regarding massage comes from Hippocrates, who says: 'The physician must be experienced in many things, but assuredly also in rubbing; for things

that have the same name have not always the same effects,*for rubbing can bind a joint that is too loose, and loosen a joint that is too rigid.' He also used the word *anatripsis*, the process of rubbing *up*, and not *down*, although not understanding the reason of it, as it was not till five hundred years later that Galen pointed out that the arteries were not filled with air, as their name would seem to imply. Asclepiades was probably not far wrong when he founded his school at Rome on the belief that diet, bathing, exercise, and friction should keep the body without disease; and Cicero affirmed that he owed as much of his health to his anointer as he did to his physician. Plutarch tells us that Julius Cæsar had himself pinched all over daily, as a means of getting rid of a general neuralgia. Celsus, at the beginning of the Christian era, advised that rubbing should be applied to the whole body, 'when an invalid requires his system to be replenished;' and Pliny availed himself of a mode of treatment which was evidently much in fashion in his day, and derived so much benefit from the remedy, that he obtained for his physician, who was a Jew, the privileges of Roman citizenship. It is related of the Emperor Hadrian that one day seeing a veteran soldier rubbing himself against the marble at the public baths, he asked him why he did so. The veteran answered: 'I have no slave to rub me.' Whereupon, the emperor gave him two slaves and sufficient to maintain them. It is quaintly added to this story, that the next day several old men rubbed themselves against the wall in the emperor's presence, when, perceiving their object, he shrewdly directed them to rub one another.

The works of Plato abound in references to the use of friction; and numberless passages might be cited from celebrated writers describing the hygienic exercises of the gymnasium, and the manner in which children were led by degrees to execute the most difficult evolutions without fear or risk of fracture. In describing the course pursued, friction, pressure, malaxation, are all in turn noticed by different authors, and strongly

recommended. The Egyptians were probably the first among civilised nations to put the system into practice, and they were copied by the Greeks and Romans. Savary, in his *Lettres sur l'Égypte*, describes part of the process: 'After the bath and a short interval of repose, whilst the limbs retain a soft moisture, an attendant presses them gently, and when each limb has become supple and flexible, the joints are cracked without effort; il masse et semble paître la chaire sans que l'on éprouve la plus légère douleur.'

In the fifteenth century, Henry II. of France decreed that a treatise should be written upon the hygienic exercises of ancient Rome. Six years later, Mercurialis took up the question from a medical point of view; after which, Ambrose Paré, the most renowned surgeon of the sixteenth century, dilated on the value of the works of Orribasius, written in the time of the Emperor Julian; and he described three kinds of friction and the effects of each, and was thought so skilful, that although a devout Huguenot, he was spared at the massacre of St Bartholomew.

To Peter Henrik Ling is given the credit of having instituted the 'Swedish movement cure.' He was even thought to have invented it; but he simply founded his system on the *Kong Fau* manuscript, which is not only the Chinese system, but that of the Brahmans, the Egyptian priests, and the Greek and Roman physicians. M. Dally has characterised his theory and practice as nothing more than a daguerrotype copy of the *Kong Fau* of Tao-ssé, and called it a splendid Chinese vase with its Chinese figures clothed in European colours. Estradère, moreover, proves that in the *San-tsai-tou-hoei*, published at the end of the sixteenth century, there is to be found a collection of engravings representing anatomical figures and gymnastic exercises; amongst these are figured frictions, pressures, percussions, vibrations—massage itself, in fact. These movements the Pekin missionaries affirm to have been in use from time immemorial, and were employed to dissipate the rigidity of the muscles occasioned by fatigue, spasmodic contractions, and rheumatic pains. The operators who practised this calling had no fixed dwelling, but used to walk about the streets, advertising their presence by the clanking of a chain, or by some sort of musical instrument.

Lepage, in his historical researches on Chinese medicine, relates that massage was a particular practice borrowed from the Indians, and that it was by such means that the Brahmans effected their miraculous cures. The word *shampooing* is of Hindu origin; but it must be borne in mind that these Old-world practices were only a faint foreshadowing of the present scientific method. In his *Dictionnaire des Sciences Médicales*, Piorry remarks that the simplest form of massage prevails wherever the people have least outgrown their primitive state; and travellers describe it as universally common in countries where nature

alone dictates the remedy for accident or disease. Captain Cook, in his voyage to Tahiti, describes that on arriving they were hospitably received, and that in the corner of a hut, carefully closed over with reeds, a large piece of matting was spread on the ground for them, and that their legs and arms were rubbed and the muscles softly pressed until all signs of fatigue had disappeared. The *Gazette des Hôpitaux*, in 1339, relates how massage is practised in the island of Tonga: 'When a person feels tired with walking or any other exercise, he lies down, and his servants go through the various operations known under the names of Toogi-toogi, mili, or fota. The first of these words expresses the action of beating constantly and softly; the second, of rubbing with the palm of the hand; the third, of pressing and tightening the muscles between the thumb and fingers. When the fatigue is very great, young children are set to tread under their feet the whole body of the patient.'

The lomi-lomi of the Sandwich Islanders is much the same thing: the process is spoken of as being that of neither kneading, squeezing, nor rubbing, but now like one, and now like the other. Dr N. B. Emerson relates that the Hawaiians are a famous race of swimmers, and to a foreigner seem amphibious. When wrecked, they sometimes swim long distances; and if one of their number becomes exhausted, they sustain him in the water and lomi-lomi him. When perfectly refreshed, they proceed upon their watery way.

Baudin, in his *Travels in New Holland*, relates that the individuals who have the greatest influence amongst the savages are the *mulgaradocks*, or medical charlatans. A *mulgaradock* is regarded as possessing power over the elements either to avert wind and rain, or to call down tempests on the heads of those who come under their displeasure. In order to calm a storm, he stands in the open air, spreads out his arms, shakes his mantle, made of skins, and gesticulates violently for a considerable time. In order to effect a cure, he proceeds much in the same way, but with rather less noise: he practises a mode of rubbing, and sometimes hits the patient with green rods which have first been heated at a fire, stopping at intervals to lot the pain pass away. The Africans follow the same fashion; and with the Russians, flagellation and friction by means of a bundle of birch twigs are resorted to. After the subject has been well parboiled in a vapour bath, a pailful of cold water is then dashed over him, the effect of which is described as electrifying. After this, he plunges into the snow, and thus prepares himself to endure the rigour of the climate with impunity. The Siberians and Laplanders also are said to indulge in these luxuries.

To France belongs the credit of giving to modern medicine a scientific system of massage; and yet, in spite of many able works, and various discussions at the Academy of Sciences and other learned societies, it remained a sort of secret practice, almost wholly under the domain of empiricism; but with the waning interest of

French physicians, the Germans and Scandinavians took up the subject; and about ten years ago, Dr Mezger of Amsterdam brought massage to be acknowledged as a highly valuable method. He placed it upon the basis of practical knowledge, thus taking it out of the hands of ignorant charlatans. He did not write much about it, but simply employed the teaching of facts. To physicians who wrote to him, for an explanation of his treatment, he only said, 'Come and see.' To Professor von Mosengeil is owing the present accurate and scientific knowledge of the subject; by his careful and painstaking observations he has brought massage into high esteem, so that it is now acknowledged as a special branch of the art of medicine.

There is, however, a pitfall to be avoided. Dr William Murrell, in his recent practical work, *Massage as a Mode of Treatment*, gives a very necessary warning to those who would use it ignorantly. He admits that it is not free from the taint of quackery, and that the so-called massage practised in some of our hospitals and under the auspices of some nursing institutions is a painful exhibition of ignorance and incompetence, being simply a degenerate form of rubbing or shampooing. Having lately witnessed the progress of a number of cases under the care of Professor Mosengeil in Germany, he remarks that the massage of 'medical rubbers' is not massage at all, as the term is understood on the continent, and has little or nothing in common with it. It is quite a mistake to think we can take John from the stables and Biddy from the wash tub, and in one easy lesson convert either into a safe, reliable, or efficient manipulator. Dr Murrell has found it successful in various kinds of paralysis; in writers', painters', and dancers' cramp; and in the cramp of telegraph office operators, who, just as they have attained to the highest point of dexterity, find that every movement is performed with effort and pain, until at last no movement is possible at all.

The chief advocates of massage have been men of note; and although it is only recently that it has gained an extensive scientific consideration, it is gradually but surely obtaining a wider circulation and a higher place as a worthy therapeutical agent.

BY ORDER OF THE LEAGUE.

CHAPTER II.

WITHOUT the city walls, hidden by the umbrella pines, and back from those secluded walks where young Rome takes its pleasure, stood the Villa Salvarino, almost under the shade of the walls, and hard by the gate of San Pancrazio. In the more prosperous days of the Eternal City, it might have been, and indeed was, the residence of some great Roman family; but aristocracies decline and families pass away; and the haughty owners were by no means averse from making a few English pounds by letting it to any traveller who had the inclination or the means to spend a few months there. The present tenant at this bright Easter-time, Sir Geoffrey Charteris, of Grosvenor Square, London, W., and

Haversham Park, in the county of Dorset, Baronet, Deputy-lieutenant, and Justice of the Peace, was a man of long descent. The pale azure fluid in his veins was not the blood of us poor mortals; his life-giving stream had been transmitted through succeeding generations from a long line of gallant warriors and gentle dames; from fearless ancestors who followed their sovereign at the call to arms, marched with Richard of the Lion-heart to the Holy Sepulchre, and maybe crossed swords with the doughty Saladin himself. The title, conferred upon a Charteris by the Black Prince, in person after the glorious field of Crécy, had known no tarnish as it passed down the long line of great and good men, soldiers, statesmen, and divines, to the present worthy representative of all these honours. Not that he had greatly distinguished himself in any field, save as an Under-secretary in a short-lived inglorious Ministry, where he had made a lasting name as the most incompetent individual ever appointed to office, though he dated every subsequent event and prefixed every after-dinner story by an allusion to the time when he was in the Earl of Muddleton's Ministry.

The reception rooms of the villa were crowded when our friends arrived. It was a kind of informal after-dinner reception, attended by most of the English visitors lingering after the Carnival, with some sprinkling of the resident aristocracy; for Sir Geoffrey liked to gather people round him, birth and genius being equally welcome. Sir Geoffrey looked every inch an English gentleman, standing there among his guests. He was apparently about fifty years of age, tall and straight, thoroughbred from his stiff gray hair to the small shapely feet, as yet untroubled by the family gout. His eyes were pale blue, and somewhat weak; his face, clear-cut and refined, with an aquiline nose and a high white forehead, but the whole marred by a mouth weak and nervous to the last degree. A connoisseur of art, a dabbler in literature, and last, but not least, a firm believer in spiritualism.

Enid Charteris, his only daughter and heiress, a girl about eighteen, must be taken for granted. Imagine in all your dreams of fair women what a golden-brown-haired girl should be, and you have Enid, with all her charms of manner and person, with that perfect expression without which the most classic features are cold. She smiled brightly as the new-comers entered. It is not given to every one to be able to disguise their likings and antipathies, and it did not need a practised eye to see her cold greeting for Le Gautier, and the instantaneous glance for Maxwell.

'I really began to think you were going to fail me,' she said; 'and this is the last of our receptions too. I shall always have pleasant recollections of my visit to Rome.'

'We have been dining with Maxwell, Miss Charteris,' Visci explained. 'Could we forget you, if we tried! And now, before you are so engaged that you can have no word for poor me, I want to ask you a favour. We are going to my country retreat on Friday, and my sister Genevieve is dying to see you. Do persuade Sir Geoffrey to come.'

'Here he is to answer for himself,' she replied,

as the baronet sauntered up to the group.—'Papa, you must promise to take me to see Signor Visci's country-house on Friday.—Do you hear?'

'Anything you say is law, my dear,' Sir Geoffrey answered with comic resignation. 'Anything you desire.—Le Gautier, I wish to speak to you,' he whispered quietly; 'come to me presently.—Salvarini, you here? I thought you had forsworn gaieties of all descriptions. Glad to see you are thinking better of your misanthropy.'

Le Gautier turned off with the baronet somewhat impatiently, leaving the rest together. Salvarini, looking on somewhat thoughtfully, almost fancied there was a look of relief in Enid's face as the Frenchman left; certainly, she was less constrained.

'We shall look forward to Friday with great pleasure, then, Signor Visci,' she said. 'I have heard you speak so much of the Villa Mattio, that I am expecting to see a perfect paradise.'

'With two Eves,' Maxwell whispered in English. Visci was not a man to misunderstand the meaning of true company, so, with a how and a little complimentary speech, he turned aside, taking Salvarini by the arm, and plunged into the glittering crowd.

'I do not understand the meaning there,' Salvarini remarked as they walked through the rooms. 'If Maxwell means'—

'Orange blossoms,' Visci interrupted laconically; 'and right, too.—Let us get into the music-room. Le Fanu is going to play.'

Maxwell remained by Enid's side, toying with her fan and discoursing in their native language in a low voice. From the expression in his face and the earnest ring in his voice, there was no doubting the power of the attraction that chained him there.

'When do you leave Rome, Miss Charteris?' he asked, abruptly changing the conversation. 'This is your last reception, I know.'

'We shall leave in the middle of next week for certain. I shall be very sorry for some reasons, for I have been happy here.'

'I shall probably return with you,' Maxwell observed. 'I have deferred my departure too long already. It would be pleasant to leave together.'

'After learning everything that Rome could teach you,' Enid put in archly. 'Then the Eternal City has no more artistic knowledge to impart?'

'Yes; I have learned some lessons here,' Maxwell replied with a tender inflection, 'besides artistic ones. I have been learning one lately that I am never likely to forget. Am I presumptuous, Miss Enid?'

'Really, Mr Maxwell, you are too mysterious. If I could understand you'—

'I think you do understand me; I fervently hope you do.'

For a moment, a little wild-rose bloom trembled and flushed on the girl's cheek, then she looked down, playing with her fan nervously. No reason to say she did not understand now. Maxwell did not follow up his advantage; some instinct warned him not; and adroitly changing the conversation, he told her of his life in Rome, each passing moment linking his chains the firmer. Gradually, as they sat talking, a group

of men gathered round, breaking in upon their tête-à-tête, laughing and talking after the most approved drawing-room fashion.

In a distant corner, Sir Geoffrey had button-holed Le Gautier, and was apparently deep in conversation on some all-absorbing subject. The Frenchman was a good listener, with that rare faculty of hearing all that was worthy of note and entirely ignoring the superfluous. He was not a man to talk much of himself, and consequently heard a great deal of family history; details and information that astute young men had found valuable on occasions. He was interested now, Maxwell thought, as he idly speculated upon his face.

'Yes,' Sir Geoffrey was saying, 'I am firmly impressed with that belief.' He had got upon his favourite topic, and was talking with great volubility. 'There are certain gifted beings who can call spirits from the vasty deep, and, what is more, the spirits will come. My dear sir, they have been manifested to me.'

'I should not wonder,' Le Gautier replied, stifling a yawn in its birth. 'I think you are quite right. I am what people call a medium myself, and have assisted at many a séance.'

'Of course you believe the same as I. Let unbelievers scoff if they will, I shall always believe the evidence of my eyes.'

'Of course,' Le Gautier returned politely, his thoughts wandering feebly in the direction of nightmare, and looking round for some means of escape. 'I have seen ghosts myself, or thought I have.'

'It is no imagination, Le Gautier,' Sir Geoffrey continued, with all the prosy earnestness of a man with a hobby. 'The strangest coincidence happened to me. My late brother, Sir Ughtred, who has been dead nearly twenty years, manifested himself to me the other night. Surely that implies some coming evil, or some duty I have neglected?'

'Perhaps he charged you with some commission,' Le Gautier observed, and pricking up his ears for any scrap of useful information.

'Not that I remember; indeed, I did not see him for years before he died. He was an eccentric man, and an extreme politician—in fact, he got into serious trouble with the authorities, and might even have been arrested, had he not removed himself to New York.'

'New York?' queried Le Gautier, wondering vaguely where he had heard of this Ughtred Charteris before. 'Was he connected with any secret society—any Socialist conspiracy?'

'Do you know, I really fancy he was,' Sir Geoffrey whispered mysteriously. 'There were certainly some curious things in his effects which were sent to me. I can show you some now, if you would like to see them.'

Le Gautier expressed his willingness; and the baronet led the way into a small room at the back of the house, half library, half studio. In one corner was an old ebony cabinet; and opening the front, he displayed a multitude of curiosities such as a man will gather together in the course of years. In one little drawer was a case of coins. Le Gautier turned them over carelessly one by one, till, suddenly starting, he eagerly lifted one and held it to the light. 'Where did you get this?' he asked abruptly.

Sir Geoffrey took it in his hand. It was a gold coin, a little larger than an ordinary sovereign, and bearing on the reverse side a curious device. 'That came with the rest of my brother's curiosities.—But why do you ask? You look as if the coin had burnt you.'

For a moment, Le Gantier had started back, his pale face aglow with suppressed excitement; but he noticed the baronet's wondering eyes upon him, he recovered himself by a violent effort. 'It is nothing'—with a smile. 'It is only the coincidence which startled me for a moment. If you will look here, you will see that I wear a similar coin upon my watch-chain.'

Sir Geoffrey looked down, and, surely enough, on the end of Le Gantier's pendant was the fac-simile of the medal he held in his hand.

'Bless me, what an extraordinary thing!' the startled baronet exclaimed. 'So it is! Perhaps you do not mind telling me where you procured yours?'

'It was given to me,' Le Gantier replied, with an enigmatic smile. 'It could not help you, if I told you.—Sir Geoffrey, may I ask you to lend me this coin for a short while? I will tell you some time what I want it for.'

'Some other time, perhaps,'—Le Gantier threw the coin into its place.—'You see, I regard it as a valuable curiosity and relic, or perhaps I might part with it. You will pardon me.—But I forgot all about our spiritualistic discourse. As you are a medium, I will ask you'—

'At some future time, with all the pleasure in life,' Le Gantier interrupted hastily. 'Meanwhile, it is getting late—past eleven now.'

As they walked back to the salon, the Frenchman was busy with his thoughts. 'What a lucky find!' he muttered. 'It is the missing insignia, sure enough, and the ill-fated Ughtred Charteris is mine host's brother. I wonder what I can make out of this? There ought to be something in it, with a feeble-minded man who believes in spiritualism, if my hand has not lost its cunning. *Nous verrons!*'

He showed nothing of his thoughts, however, as he parted from Enid with a smile and neatly turned compliment. It was getting late now; the streets were empty as the friends turned homeward, Salvarini bidding the others good-night and turning off in the direction of his apartments.

'You had better change your mind, and come with us on Friday, Hector,' Visci urged Le Gantier. 'The baronet and his daughter are to be of the party. Throw work to the dogs for the day, and come.'

'My dear Carlo, the thing is impossible. Do you think I should be chained here this lovely weather, if stern necessity did not compel? If possibly I can get over later in the day, I will not fail you.'

'I am very sorry,' Visci replied regretfully, 'because this is the last time, in all probability, our friends will meet together for some time.'

'I am sorry too, Carlo, but I cannot help it. Good-night.'

Le Gantier watched his friend along the moonlit street, a smile upon his face not pleasant to see. 'Ah, yes,' he murmured, 'it is quite impossible. Genevieve is a good little girl, but

good little girls are apt to cloy. It is getting dangerous. If Visci should find out, it would be a case of twelve paces and hair-triggers; and I cannot sacrifice myself yet—not even for Genevieve.'

ULSTER PROVINCIALISMS.

THE people of Ulster may fairly claim a larger share of public attention than has usually been accorded to them: they have rendered their province prosperous, in a country which is a stranger to prosperity; they have established and maintained great industries in a country of decayed trade and ruined commerce. In the colonies, they have risen in a remarkable degree to positions of affluence and authority; and in all the British dominions, Ulstermen are found in the van of commercial and professional life.

The Ulsterman comes of a very mixed descent. Just as the Englishman was originally a compound of Saxon, Norman, and Dane, so in the Ulsterman's veins flows the blood of Irish, Scotch, and English progenitors. The relative proportion of each element varies much according to locality and religion. On the shores of Antrim and Down, the population is in many places almost as purely Scotch as in Ayrshire or Lanark. In Belfast, Scotch blood predominates; but there was originally a large English element. In Donegal and Fermanagh, the Celtic element is in excess. Everywhere, the Protestant derives more from Scotch and English sources; the Roman Catholic, from Irish.

From the earliest times, there has been a large emigration from Scotland to the opposite Irish shore. During the reigns of Elizabeth and James I. the chief settlements from England took place; and the settlers from both countries gradually pushed back the original Irish inhabitants to the mountains and into the interior. To this day, there is a secluded district in County Antrim, known as the Glens of Antrim, where the Irish language may still be heard, although it has long departed from other portions of the same county. As we travel westward, Irish more frequently meets the ear, and in many parts of Donegal it is the prevailing tongue.

It is not surprising that in a province of such varied lineage, provincialisms should be numerous and curious. To guard against misconception, let it be understood that the educated Ulsterman speaks like educated people elsewhere—namely, with perfect correctness and scarcely appreciable accent. The peculiar words and phrases about to be enumerated are heard almost exclusively among the poorer ranks, or, if employed at all by the educated classes, it is only in jest and with a recognition of their provincial character. The majority of them are of Scotch origin; some are found in colloquial and provincial English; while others are of Hibernian extraction.*

As might have been expected, proverbs and

* We are indebted for much of the information contained in this article to an excellent glossary compiled by Mr W. H. Patterson, M.R.I.A., of Belfast.

proverbial expressions form a large class of these provincialisms. 'All to the one side, like Clogher,' is an allusion to a town in County Tyrone where all the houses and shops are on one side of the thoroughfare, the opposite side being a private demesne. 'That baugs (surpasses) Banagher' is an allusion to the great fair held at that spot. When the Ulsterman wishes to imply that a certain event is extremely improbable, he says that it will happen at 'Tibb's Eve,' adding the mysterious information that this is 'neither before nor after Christmas.' This expression is a curiously exact counterpart of the Latin phrase about the Greek kalends. 'As blunt as a beetle' refers to a species of heavy wooden mallet to which Shakespeare alludes. 'As busy as a nailer,' 'As clean as a new pin,' 'As crooked as a ram's horn,' are common Ulster expressions, which do not call for any explanation. A more mysterious expression is the curious phrase, 'As grave as a mustard-pot'—used to express preternatural solemnity. People of bilious complexion are often described with more force than elegance as being 'As yellow as a duck's foot.'

The Ulsterman has no special répute for galling, yet his simile for anything exceptionally simple is, 'As easy as kias.' His favourite phrase when about to impart some very confidential information is, 'Between you and me and the post.' A person whose sanity is open to question is often described as 'Wanting a square of being round'—a curiously inexact expression. A person who gapes with wide-mouthed wonder is said to look 'like a duck in thunder.' Similarity of political or religious opinion is expressed in Ulster by saying that two people 'Dig with the same foot.' 'A dead man's plunge' is a peculiar Ulster expression; it is applied to the short, sudden, and rather hollow sound made by a smooth flat pebble when it is tossed into the air and falls into water upon its edge.

A large class of provincialisms are made up of associative expressions. The Ulsterman often prefaces his remarks by 'Assay' (I say) or 'A'm sayin' (I'm saying). 'May I never stir' introduces some peculiarly solemn assertion. 'A month of Sundays,' and still more strongly, 'All my born days,' are emphatic expressions for long periods of time. 'Dear help your wit' expresses commiseration for the innocence and simplicity of the person addressed.

Ulster adjurations are a curious medley, 'Hoth' and 'Feth' being frequently used. 'By Jaiminie King' is a curious expression often heard in County Fermanagh. 'Holy Farmer' is another obscure form of oath. 'Hokey oh' is a phrase implying astonishment and alarm. 'Hoker' is used by Chancer to express frowardness, and 'Hoer' in Anglo-Saxon meant a reproach. These words probably contain the clue to the origin of this obscure Ulster provincialism.

Expressions conveying contempt or endearment are common. 'Bad scan to you' is a phrase of angry contempt. 'Skran' in Icelandic means 'refuse.' Milton used the word 'scranell' ('scranell pipes') to express poor or mean; and 'scranny' still survives in provincial English in this sense. 'Bad cess to you' is another Ulsterism of similar meaning, of which the origin is more doubtful; possibly 'cess' is a contraction for success. 'Give me none of your buck-talk'

is said by a superior to an inferior, meaning, 'Don't presume to argue the question with me.' A 'Tory rogue' is still commonly used in Ulster in the sense of a scamp; but it is often applied to children in a playful sense. It is an interesting relic of the original meaning of the word Tory—an Irish outlaw or freebooter. A 'tongue-thrashing' is a vigorous phrase for a severe rebuke. 'Carnaptious' means quarrelsome and fault-finding.

Some salutations are characteristic of the northern province. 'How do you get your health?' often takes the place of the more vague, 'How do you do?' 'The top of the morning to you' is a cheery way of saying 'Good-morrow.'

As might have been expected, there is a long array of peculiar botanical and zoological expressions characteristic of Ulster. Every district has its local names for flowers, plants, birds, and animals, and in these Ulster is peculiarly rich. Potatoes are known as 'spuds'; 'biller' means water-cress; 'daffydowndillies' is a lengthened form of daffodils; 'mayflower' is the marsh marigold or *Caltha palustris*. The heads of the common plantain are called 'cocks' or 'fighting-cocks,' because children make a game of striking them off in mimic warfare. The dock-plant is called the 'dockan' (Scotch), and its leaf is a popular remedy for nettle-sting; the wood-sorrel is known as 'cuckoo-sorrel.'

A still longer list of zoological terms might be made out. The bottle-nosed whale is known as the 'berring-log'; the pollack is called 'lythe'; the lobworm used by fishermen for bait is called the 'lug'; the stickleback has its name corrupted into 'spricklybeg'; the gadfly is known as the 'cleg' (which is also its Scotch name); 'yilly-yorlin' (also Scotch) is the yellow-hammer; the 'felt' is the redwing; the 'pewee' (Scotch again) means the lapwing; the 'mosscheeper' is the titlark; the cornorant is known as the 'scart.'

We now turn to some provincialisms which do not admit of a ready classification. 'Bis' is often said for 'is,' and 'bissent' for 'is not.' Here we have an instance of a very common phenomenon—an archaic form surviving as a colloquialism or provincialism. A vast number of our common vulgarisms which we are inclined to regard as branches of grammar are simply good grammar out of date; in this case, the provincialism almost exactly preserves a very ancient form of the verb. The Anglo-Saxon verb 'to be' present tense indicative mood was 'beom, bist, bið,' whence no doubt come 'bis' and 'bissent.' 'Braird,' often used in Ulster, as in Scotland, of the young springing grain, is the Anglo-Saxon 'brord,' meaning the first blade. 'Buffer' in the sense of 'boxer' is from the old French word 'bufte,' meaning a blow.

'Chew, sir,' is a form of rebuke applied to a snarling dog. 'Dwanish' means faint and sick, from 'dwam,' a Scotch word signifying a swoon or a sudden attack of illness. 'Dunt' means a blow, and is old English and Scotch; Burns says, 'I'll tak dunts frae nobody.' A 'founder,' according to our dictionaries, is a term in farriery to indicate lameness caused by inflammation within the hoof of a horse. In Ulster, the word is often used to express a chill or wetting followed

by illness. A man after being exposed to the vicissitudes of weather becomes seriously ill without knowing what is the matter, and he expresses his condition by saying that he has got 'a regular founder.' 'Head-beetler' is used in the same vulgar sense as 'Head-cock and bottle-washer' in some localities. The beetle was a 'machine for producing figured fabrics by the pressure of a roller, and 'head-beetler' probably means the chief director of this class of work. A 'heeler' is a cock which strikes out well with his heels. In Ulster, the word is sometimes used for a bold forward woman.

When a child begins to nod and look sleepy, he is told that 'Johnny Nod is coming up his back,' which is understood as a signal for going to bed. 'Potatoes and point' is a curious phrase in which the poverty of the lower classes in Ireland finds unconscious expression. The idea is, that the potatoes before being eaten are 'pointed' at a herring, which is hung up to serve as an imaginary relish to the simple fare, but too precious to be freely consumed. 'Dab at the stool' is another expression referring to eating customs; salt is placed upon a stool, and each individual, as the potatoes are taken out of the pot, takes one and 'dabs' it at the stool, to get a portion of the salt. 'Pouce' and 'poucey' mean dust and dusty, but by a common perversion of language, 'poucey' comes to mean a person in a flax-mill who is exposed to the irritation of dusty particles, and becomes in consequence short-winded and bronchitic. 'Houghness,' as in Scotland, means plenty. 'Ruction' signifies a row, a disturbance; possibly it is a contraction of ruction, from the Latin verb *ructare*. 'Skelly,' to squirt, is from the Scotch, and is found in Scott. The Danish is 'skelc.' 'Smittle,' also used in Scotland, means infectious, and is connected with the verb to smite. 'Think long' means to be homesick.

We thus see how much curious information and how many relics of the past are found in the despised vulgarisms of a provincial patois. They are the fossils of language, and speak to us of vanished peoples and of ages long gone by.

IN ALL SHADES.

CHAPTER XLVI.

THE days went slowly, slowly on, and Mr Dupuy and Harry Noel both continued to recover steadily from their severe injuries. Marian came over every day to help with the nursing, and took charge for the most part, with Aunt Clemmy's aid, of the young Englishman; while Nora's time was chiefly taken up in attending to her father's manifold necessities. Still at odd moments she did venture to help a little in taking care of poor Harry, whose gratitude for all her small attentions was absolutely unbounded, and very touching. True, she came comparatively seldom into the sickroom (for such in fact it was, the crushing blow on Harry's head having been followed by violent symptoms of internal injury to the brain, which made his case far more serious in the end than Mr Dupuy's); but

whenever he woke up after a short doze, in his intervals of pain, he always found a fresh passion-flower, or a sweet white rosebud, or a graceful spray of clambering Martinique Clematis, carefully placed in a tiny vase with pure water on the little table by the bedside; and he knew well whose dainty fingers had picked the pretty blossoms and arranged them so deftly, with their delicate background of lace-like wild West Indian maiden-hair, in the tiny bouquets. More than once, too, when Aunt Clemmy wasn't looking, he took the white rosebuds out of the water for a single moment and gazed at them tenderly with a wistful eye; and when, one afternoon, Marian surprised him in the very act, as she came in with his regulation cup of chicken-broth at the half-hour, she saw that the colour rushed suddenly even into his brown and bloodless cheek, and his eyes fell like a boy's as he replaced the buds with a guilty look in the vase beside him. But she said nothing about the matter at the time, only reserving it for Nora's private delectation in the little boudoir half an hour later.

As Mr Dupuy got better, the firm resolve seemed to have imprinted itself indelibly upon his unbending nature—the resolve to quit Trinidad for ever at the very earliest moment, when convalescence and Macfarlane would combine to allow him. He would even sell Orange Grove itself, he said, and go over and live permanently for the rest of his days in England. 'That is to say, in England for the summer,' he observed casually to Nora; 'for I don't suppose any human being in his right senses would ever dream of stopping in such a wretched climate through a whole dreary English winter. In October, I shall always go to Nice, or Pau, or Mentone, or some other of these new-fashioned continental wintering-places that people go to nowadays in Europe; some chance, I suppose, of seeing the sun once and again there, at anyrate. But one thing I've quite decided upon: I won't live any longer in Trinidad. I'm not afraid; but I object on principle to vivisection, especially conducted with a blunt instrument. At any time of life, a man naturally dislikes being cut up alive by those horrible cutlasses. You and your cousin Tom may stop here by yourselves and manage Pimento Valley, if you choose; but I decline any longer to be used as the *corpus vile* for a nigger experimentalist to exercise his skill upon. It doesn't suit my taste, and I refuse to submit to it. The fact is, Nora, my dear, the island isn't any longer a fit place for a gentleman to live in. It was all very well in the old days, before we got a pack of Exeter Hall demagogues, sent out here by the government of the day on purpose to excite our own servants to rebellion and insurrection against us. Nobody ever heard of the niggers rising or hacking one to pieces bodily in those days. But ever since this man Hawthorn, whose wife you're so thick with—a thing that no lady would have dreamt of countenancing in the days before these new-fangled doctrines came into fashion—ever since this man Hawthorn was sent out here, preaching his revolutionary cut-throat principles broadcast,

the island hasn't been a fit place at all for a gentleman to live in; and I've made up my mind to leave it at once and go over to England.'

Meanwhile, events had arisen which rendered it certain that the revolutionary demagogue himself, who had saved Mr Dupuy's life and all the other white lives in the entire island, would also have to go to England at a short notice. Edward had intended, indeed, in pursuance of his hasty promise to the excited negroes, to resign his judgeship, and return home, in order to confer with the Colonial Office on the subject of their grievances. But before he had time to settle his affairs and make arrangements for his approaching departure, a brisk interchange of messages had taken place between the Trinidad government and the home authorities. Meetings had been held in London at which the whole matter had been thoroughly ventilated; questions had been asked and answered in parliament; and, the English papers had called unanimously for a thorough sifting of the relations between the planters and the labourers throughout the whole of the West India Islands. In particular, they had highly praised the courage and wisdom with which young Mr Hawthorn had stepped into the breach at the critical moment, and single-handed, averted a general massacre, by his timely influence with the infuriated rioters. More than one paper had suggested that Mr Hawthorn should be forthwith recalled, to give evidence on the subject before a Select Committee; and as a direct result of that suggestion, Edward shortly after received a message from the Colonial Secretary, summoning him to London immediately, with all despatch, on business connected with the recent rising of the negroes in Trinidad.

Mr Dupuy had already chosen the date on which he should sail; but when he heard that 'that man Hawthorn' had actually taken a passage by the ~~same~~ steamer, he almost changed his mind, for the first time in his life, and half determined to remain in the island, now that it was to be freed at last from the polluting presence and influence of this terrible fire-eating brown revolutionist. Perhaps, he thought, when once Hawthorn was gone, Trinidad might yet be a place fit for a gentleman to live in. The Dupuys had inhabited Orange Grove, father and son, for nine generations; and it would be a pity indeed if they were to be driven away from the ancestral plantations by the meddling interference of an upstart radical coloured lawyer.

In this dubitative frame of mind, then, Mr Dupuy, as soon as ever Macfarlane would allow him to mount his horse, again, rode slowly down from Orange Grove to pay a long-meditated call at Government House upon His Excellency the governor. In black frock-coat and shiny silk hat, as is the rigorous etiquette upon such occasions, even under a blazing tropical noontide, he went his way with a full heart, ready to pour forth the vials of his wrath into the sympathetic ears of the Queen's representative against this wretched intriguer Hawthorn, by whose Machiavellian machinations (Mr Dupuy was justly proud in his own mind of that sonorous alliteration) the happy and contented peasantry of the island of Trinidad had been spurred and flogged

and slowly roused into unwilling rebellion against their generous and paternal employers.

Judge of his amazement, therefore, when, after listening patiently to his long and fierce tirade, Sir Adalbert rose from his chair calmly, and said in a clear and distinct voice these incredible words: 'Mr Dupuy, you unfortunately quite mistake the whole nature of the situation. This abortive insurrection is not due to Mr Hawthorn or to any other one person whatever. It has long been brewing; we have for months feared and anticipated it; and it is the outcome of a widespread and general discontent among the negroes themselves, sedulously fostered, we are afraid'—here Mr Dupuy's face began to brighten with joyous anticipation—'by the unwise and excessive severity of many planters, both in their public capacity as magistrates, and in their private capacity as employers of labour.' (Here Mr Dupuy's face first fell blankly, and then pursed itself up suddenly in a perfectly comical expression of profound dismay and intense astonishment.) 'It is to Mr Hawthorn alone,' the governor went on, glancing severely at the astounded planter, 'that many unwise proprietors of estates in the island of Trinidad owe their escape from the not wholly unprovoked anger of the insurgent negroes; and so highly do the home authorities value Mr Hawthorn's courage and judgment in this emergency, that they have just summoned him back to England, to aid them with his advice and experience in settling a new *modus vivendi* to be shortly introduced between negroes and employers.'

Mr Dupuy never quite understood how he managed to reel out of the governor's drawing-room without fainting, from sheer astonishment and horror; or how he managed to restrain his legs from lifting up his toes automatically against the surer person of the Queen's representative. But he did manage somehow to stagger down the steps in a dazed and stupefied fashion, much as he had staggered along the path when he felt Delgado hacking him about the body at the blazing cane-houses; and he rode back home to Orange Grove, red in the face as an angry turkey-cock, more convinced than ever in his own mind that Trinidad was indeed no longer a fit place for any gentleman of breeding to live in. And in spite of Edward's having taken passage by the same ship, he determined to clear out of the island, bag and baggage, at the earliest possible opportunity.

As for Harry Noel, he, too, had engaged a berth quite undesignedly in the self-same steamer. Even though he had rushed up to Orange Grove in the first flush of the danger to protect Nora and her father, if possible, from the frantic rioters, it had of course been a very awkward position for him to find himself an unwilling and uninvited guest in the house which he had last quitted under such extremely unpleasant circumstances. Mr Dupuy, indeed, though he admitted, when he heard the whole story, that Harry had no doubt behaved 'like a very decent young fellow,' could not but be prevailed upon to take any notice of his unhidden presence, even by sending an occasional polite message of inquiry about his slow recovery from the adjoining bedroom. So Harry was naturally anxious to get away from Orange Grove as quickly as possible, and he had made up

his mind that before he went he would not again ask Nora to reconsider her determination. His chivalrous nature shrank from the very appearance of trading upon her gratitude for his brave efforts to save her on the evening of the outbreak; if she would not accept him for his own sake, she should not accept him for the sake of the risk he had run to win her.

The first day when Harry was permitted to move out under the shade of the big star-apple tree upon the little grass plot, where he sat in a cushioned bamboo chair beside the clump of waving cannas, Nora came upon him suddenly, as if by accident, from the Italian terrace, with a bunch of beautiful pale-blue plumbago and a tall spike of scented tuberose in her dainty, gloveless, little fingers. 'Aren't they beautiful, Mr Noel?' she said, holding them up to his admiring gaze—admiring them, it must be confessed, a trifle obliquely. 'Did you ever in your life see anything so wildly lovely in a stiff, tied-up, staircase conservatory over yonder in dear old England?'

'Never,' Harry Noel answered, with his eyes fixed rather on her blushing face than on the luscious pale white tuberose. 'I shall carry away with me always the most delightful reminiscences of beautiful Trinidad and of its lovely—flowers.'

Nora noticed at once the significant little pause before the last word, and blushed again, even deeper than ever. 'Carry away with you?' she said regretfully, echoing his words—'carry away with you? Then do you mean to leave the island immediately?'

'Yes, Miss Dupuy—immediately; by the next steamer. I've written off this very morning to the agents at the harbour to engage my passage.'

Nora's heart beat violently within her. 'So soon!' she said. 'How very curious! And how very fortunate, too, for I believe papa has taken berths for himself and me by the very same steamer. He's gone to-day to call on the governor; and when he comes back, he's going to decide at once whether or not we are to leave the island immediately for ever.'

'Very fortunate? You said very fortunate? How very kind of you. Then you're not altogether sorry, Miss Dupuy, that we're going to be fellow-passengers together?'

'Mr Noel, Mr Noel! How can you doubt it?'

Harry's heart beat that moment almost as fast as Nora's own. In spite of his good resolutions—which he had made so very firmly too—he couldn't help ejaculating fervently: 'Then you forgive me, Miss Dupuy! You let bygones be bygones! You're not angry with me any longer!'

'Angry with you, Mr Noel—angry with you! You were so kind, you were so brave! how could I ever again be angry with you!'

Harry's face fell somewhat. After all, then, it was only gratitude. 'It's very good of you to say so,' he faltered out tremulously—'very good of you to say so. I—I—I shall always remember—my—my visit to Orango Grove with the greatest pleasure.'

'And so shall I,' Nora added in a low voice, hardly breathing; and as she spoke, the tears filled her eyes to overflowing.

Harry looked at her once more tenderly. How beautiful and fresh she was, really! He looked at her, and longed just once to kiss her. Nora's hand lay close to his. He put out his own fingers, very tentatively, and just touched it, almost as if by accident. Nora drew it half away, but not suddenly. He touched it again, a little more boldly this time, and Nora permitted him, unrepining. Then he looked hard into her averted febrile eyes, and said tenderly the one word, 'Nora!'

Nora's hand responded faintly by a slight pressure, but she answered nothing.

'Nora,' the young man cried again, with sudden energy, 'if it is love, take me, take me. But if it is only—only the recollection of that terrible night, let me go, let me go, for ever!'

Nora held his hand fast in hers with a tremulous grasp, and whispered in his ear, almost inaudibly: 'Mr Noel, it is love—it is love! I love you—indeed I love you!'

When Macfarlane came his rounds that evening to see his patients he declared that Harry Noel's pulse was decidedly feverish, and that he must have been somehow over-exciting himself; so he ordered him back again ruthlessly to bed at once till further notice.

A LEOPARD HUNT.

It was my good fortune, a great many years ago, to be cantoned at Julbarri. I say 'good fortune,' for so I considered it; but I am afraid, if you had asked at our mess for votes as to whether I ought to qualify the word fortune with the adjective 'good' or 'bad,' I should have got very few to vote for my word. Good fortune I considered it, nevertheless; for I was an ardent sportsman; Julbarri was almost untried ground; and the neighbouring jungles abounded in game of many kinds, among which the rhinoceros, the tiger, and the leopard were by no means few and far between. And yet I cannot deny that for any one who was not a sportsman, Julbarri was about as slow a station as could be picked out in all the length and breadth of our vast Indian empire. It was situated in an out-of-the-way corner of Bengal; and there was no large station within a couple of hundred miles of us where a man with social and gregarious tastes could go for a few days to get rid of the oft-told tales and well thrashed-out politics of the limited circle of our small mess-table. Julbarri was, alas, a single-corps station; and except a Civil officer or two, the whole society consisted of the gallant British officers of the distinguished 76th Native Infantry; a nice set of fellows enough, I allow; but still the best of listeners must in time grow inattentive to Smith's ideas on the comparative merits of Arab and English horses; and it is difficult to wage any real warfare with Jones as he challenges you for the hundredth time to defend Lord Gough's tactics at Chillianwalla.

At the time of which I write, our society was at a peculiarly low ebb. The drill season was over; the hot weather was coming on; and the leave season had begun. There was so little work to be done, that our colonel had taken pity on our isolation, and had been unusually, perhaps almost unauthorisedly, liberal in the

matter of leave; and our mess, small enough at its best, had dwindled and dwindled, until now not more than half-a-dozen unfortunates daily stretched their legs beneath its well-spread mahogany. For me, the approaching heat had no terrors, the smallness of our society no ennui, and the prospect of escape from Julharri no charms; for the beginning of the hot weather is the very time when the best shooting can be obtained, and I had long been watching the drying up of the grass in the jungles, and had been looking forward to the time when we might start a tiger with some chance of bagging him. There was one thing in which we were particularly fortunate: we had attached to our regiment nine elephants as a part of our regimental transport. I need scarcely say that it was not long before we had the elephants and their mahouts (drivers) thoroughly trained for shooting. The largest elephants we trained to carry our howdahs, and the smaller we used to form a line to beat the jungles and drive out the game. With these elephants we had lots of fun, and there were few weeks after the shooting season began in which some of us did not go out two or three times. We generally took it in turns; four of us went out, and two remained behind to look after the regiment and the station.

We kept three or four shikarees (native hunters), who were constantly going about the villages and jungles within a radius of six or seven miles of cantonments; and as soon as they heard of a tiger having killed a bullock or any other animal, or as soon as they discovered the fresh footmarks of any animal worth going after, they would come in and give the *khubber* (news); and then those whose turn it was would send the elephants and their arms on towards where the game had been seen, and would follow themselves on horseback as quickly as possible. The best kind of *khubber* was when a bullock or any other large animal had been killed. The tiger usually prowls round some village or some place where cattle is pastured and kept for the night; and when he sees his opportunity, will spring on some unfortunate animal which has got separated from the rest of the herd, or has remained out too late in the jungle, heedless of the herdsman's call home, will kill it with a blow of his paw, and drag it into some neighbouring jungle thicker and denser than that immediately around the village.

Nothing shows more the marvellous strength possessed by the tiger than the way in which he carries his victim away. I remember the first time I was shown where a tiger had dragged a full-grown bullock. I could not believe it possible; and it was not until after we had killed the robber—only an ordinary-sized tigress—and I had carefully gone over on foot the ground where she had dragged her prey, that I found that she had not only dragged the dead bullock—an animal, I should think, considerably beyond her own weight—over very rough ground and through a dense cane-brake; but that in some places, as the marks showed, she must actually have lifted the fore-quarters of the bullock off the ground in her mouth, and have walked several yards with it in that position. When the victim has been dragged to what the tiger considers a position of security, it will sit down

and make a good meal, and then retire a short distance from its prey to some particularly thick bush or tuft of grass, and there remain until the following night, and then return for another meal. In consequence of this well-known habit, 'a kill,' as it is called, is the best of all *khubbers*, and in such cases, if the tiger has not been disturbed, the sportsman is almost sure to find him lying somewhere close to the carcass; and if his arrangements are well made, is pretty sure to get a shot at him.

Our shikarees, stimulated by liberal backsheesh when their news resulted in a bag, used often to bring us in *khubber*; but sometimes the news was not very good; and when this was the case, the less ardent sportsmen of our number would frequently refuse to go out, and would make over their turn to me. I never refused, for I was young and enthusiastic enough to love the fun and the excitement of the hunt, even when our expedition resulted in no bag; and did not care for the chaff with which my sedate comrades would greet me on my return. Sometimes, however, the laugh was on my side; but I was wise enough, with a view to future contingencies, not to indulge in it too much.

We had been having very fair sport on and off for about six weeks, and the animals in the jungles close around the station seemed to have been all killed off or driven away; for a whole week passed, and no *khubber* good enough to tempt even me did our shikarees bring. It was the seventh blank day, and as we sat at our *chota haari* (early morning cup of some invigorating but harmless beverage), under the shade of a splendid mango-tree which grew conveniently close to our messhouse veranda, my clown and I were discussing the necessity of taking a week's trip across the river which skirted our station, and were trying to cajole our companions into letting us have the use of the elephants for so long a time. We had nearly succeeded in persuading them of the uselessness of expecting to get any more shooting close to Julharri, and two of the least enthusiastic of our Nimrods had actually given in, when into the compound and right up to our table who should dash but Jamal, the very best and most trustworthy of all our shikarees! Almost breathless, he stammered out: 'Sahib, sahib, two such huge tigers! Their pugs are as big as that,' and he described with the aid of the stick he held in his hand a figure in the dust, intended to portray the size of their footprints, which would have done credit to a well-grown mammoth. 'They have killed a bullock in the Kala jungle, only six miles off; and I am sure they were still there when I left half an hour ago. I ordered the elephants to be got ready as I passed the liwas.'

Here was news with a vengeance; but alas, it was my turn to stay in cantonments; and with such splendid *khubber* as this I could not, of course, even hint the suggestion of an exchange. It was the custom of those going out, to borrow all the firearms of those remaining behind; so I and Castleton, who was my comrade in misfortune, made over our Joe Manton guns and our Purdeys to our luckier companions, and wished them good speed with the best grace we could muster; and if we betrayed our feelings a little by throwing after them the parting exhortation,

'Mind you don't miss the fifteen-footer,' well, I really think we ought to be forgiven.

Castleton was a married man; and I must crave the ladies' pardon for omitting in my list of our Julbarri residents the really charming Mrs Castleton and her fascinating sister, Miss Jervoise. As soon as the hunters had gone, Castleton turned to me, and said: 'You had better come over and lunch with us, Watson. You'll only be brekening your heart over visions of those two fabulously footed tigers, if you lunch at mess alone.'

I thanked him; and two o'clock found me receiving the commiserations of the two fair ladies, while they pressed upon me the usual profuse hospitality of an Indian luncheon. We had reached the dessert stage, and Mrs Castleton was just pressing me to taste some specially delicious plantains which a neighbouring rajah had sent her the day before, when the bearer came in, and making a salaam, said to Castleton: 'A man has just come from that little hamlet of Goree; he wants the sahib log to go out and shoot a leopard which has just killed one of his kids, and is now lying eating it in a small patch of jungle. Goree is only a mile and a half from here.'

We stared blankly at each other.

'What can we do?' said Castleton.

'Do? Why, go and shoot it, of course!' exclaimed the enthusiastic Miss Jervoise.

'But, Kate dear,' broke in Mrs Castleton with wifely solicitude, 'the elephants are all away, and how can they shoot it?'

'Oh, I am not thinking about the elephants,' replied Castleton; 'but Watson and I have lent all our rifles and guns, and we haven't a single thing of any kind left.'

'There are the sepoys' rifles,' I suggested. 'We could take one of them apiece; and, you know, we can't let the leopard get off without having a try for him. Can we?'

'Yes, there are the sepoys' rifles, certainly,' replied Castleton rather doubtfully; 'but'—

'And I have got a couple of spears,' I interrupted. 'Oh, do let us go at once, before he is disturbed.'

'Well—all right; we'll try it,' said Castleton hesitatingly.

I lost no time in running home and changing into a shooting costume. Castleton sent his orderly off to the lines for our weapons; and by the time I had returned with the spears, the orderly reappeared with a couple of rifles and a packet of cartridges. So, a very short time saw us mounted on our horses and following our guide out to the little village of Goree.

'I am not very sure about the wisdom of this business,' said Castleton.

'Oh, it will be all right,' I replied. 'We must be careful not to fire until we are pretty sure to kill—that's all.'

'Hm, yes, I suppose so,' assented my comrade somewhat doubtfully.

As a matter of fact, it was not an overwise business. Our regiment was armed in those days with the short two-grooved Brunswick rifle, a muzzle loader, of course, and one in which the bullet had to be hammered into the muzzle with a small wooden hammer carried for the purpose, before it could be rammed down with the ramrod.

This rendered the process of loading so dreadfully slow that practically it would make it quite impossible for either of us to get more than one shot, and it is no easy matter to kill a leopard with one bullet, however well placed. If he were not killed, he would be pretty certain to charge, and we should be in an awkward plight.

Matters did not look much more encouraging when we reached Goree. The *khubber* was good enough: there was the place where the kid had been struck, and there were the drops of blood and footprints of a large leopard leading into a patch of dense cane-jungle about one hundred yards long and sixty yards broad, and we had very little doubt that he was in there, sure enough. We arranged, somewhat rashly, that we would enter the jungle from nearly opposite ends of the patch and work towards the centre. If either of us saw the leopard, we were, if possible, first to whistle and then to call out before shooting. We did this with a double object—first, that we might not shoot each other; and secondly, that if one of us wounded the beast and he came towards the other, we might be on the lookout for him, and not be taken unawares. So we separated; and I cautiously entered the left end of the patch, while Castleton made his entrance on the right. My end of the jungle was thicker than Castleton's; but the edge was fairly clear, and by peering under the brake, I could see four or five yards in front of me. Very soon, the cane and bushes became so dense that I had to clear away the leaves with one hand while I held the rifle ready cocked in the other. We had each a sepoy accompanying us and carrying our second weapon, the spear. To my man I gave instructions that the moment I fired, I would hand him back the rifle, and he was to give me the spear. Of course I kept him behind me, so that he should be in no danger. We had not begun our advance more than two or three minutes, and had not penetrated, at our slow and cautious pace, more than about twenty yards, when Castleton whistled. I at once stood still. After a slight pause, he called out in a sort of stage whisper: 'I see him; but it's a nasty shot. I can only see his hind-quarters, and there is a lot of jungle in the way. Shall I shoot?'

'Fire away,' I replied, in an equally melodramatic tone, heartily wishing that his chance had been mine. In about half a minute the report of Castleton's rifle rang out. It was followed by an angry roar somewhere from my right front, and there was a dead silence. The smoke from Castleton's rifle came floating over my head; but though I listened intently with my rifle half raised to my shoulder, not the sound of a footstep or the cracking of a twig could I hear. At last Castleton called out: 'I've hit him, but not badly, I think; and he has gone off in your direction.'

Giving Castleton time to reload, I again began moving forward with even greater caution than before. I had advanced only a few paces, when on pushing aside a screen of leaves thicker than usual, and thrusting my head into a bush, I met a sight that made my heart jump: there, within about six feet of me, crouched the leopard, his eyeballs glowing like balls of green fire in the dark jungle, a look of the most savage mischief on his face, and evidently just on the

point of springing straight at me. My first impulse was to throw my rifle to my shoulder and fire at once; but more quickly than a flash of lightning came the conviction, like a living voice speaking in me: 'If you do, and if you don't kill him dead, he'll kill you.' My nerves seemed to grow steady at once, and I checked my first rash impulse. Then keeping my eye fixed on his, I raised my rifle slowly and deliberately, took a steady aim, and fired. A dull groan and a desperate convulsion followed, and then in half a minute all was still. My faithful sepoy had duly obeyed my instructions; he had taken my rifle and had given me the spear, and with this spear held at the charge, ready to receive the leopard if he came my way, we waited until the convulsion subsided. Then peering in again, we found that the leopard had gone back; and it was not until we had advanced some ten yards that we came upon him lying dead. It shows the marvellous vitality of the feline race; for though the ball was a heavy one, and had crashed right through the brain, yet he had managed to go fully, eight yards from where he was crouching. Had the ball been turned aside at all by a twig, or had it glanced off his skull, he would almost certainly have made his spring, and in a jungle so dense I could hardly have hoped to keep him off or defend myself.

I called up Castleton at once, and we soon pulled the leopard out of the thicket. We found Castleton's bullet had hit him in the side, but far back, so as not to interfere in any way with his powers of attack. I congratulated myself on a lucky escape. The villagers were delighted at the death of a robber which had more than once laid their flocks under contribution, and pressed their services on us to carry him home. A procession was soon formed, and we returned to Julbarri in triumph with the leopard hanging on a pole in front of us. The other hunters had not returned; so we had ample time to exhibit our prize to the sympathetic eyes of Mrs Castleton and Miss Jervoise. In about an hour, the others returned, wearied and disgusted. The tigers had been disturbed before their arrival, and had betaken themselves to some very heavy jungle, whence, in spite of their best efforts, they were unable to dislodge them. It required a lot of good feeling on their part to make them congratulate us as heartily as they did; and I hope our sympathy with their ill-luck showed itself quite untinged with any sense of our own better fortune.

A TALE OF TWO KNAVERIES.

IN FOUR CHAPTERS.—CHAP. III.

In the course of the next three months, Mr Blackford's relations with his crazy client Willoughby entered upon a somewhat uncomfortable phase. He had continued his heartless game with the poor wretch, entertaining him with purely imaginative accounts of the superhuman exertions which were being made on his behalf, and bleeding him with a rapacity which grew with each successive extortion. He had in this way obtained nearly a hundred pounds, when

something happened which he might have foreseen had he not been blinded by his greed, and which caused him to entertain very unpleasant misgivings. Had Willoughby been a sane man, pursuing a sane object, these repeated demands for money, unaccompanied by any tangible performance, would have aroused suspicions which would have manifested themselves in the usual manner. But being as he was, his disease coloured everything which happened to him; and the perfectly natural suspicions which arose in his mind made themselves heard only by the mocking voices of his airy persecutors. So one morning he informed Mr Blackford that the persons who followed him wherever he went had adopted fresh tactics.

'They have managed to find out what I come here for,' said he, 'and they are trying to frighten me out of doing so in a very curious way. In fact,' he continued with an uneasy laugh, 'they have taken to slandering you as well.'

'And what are they good enough to say about me?' inquired the solicitor, in much surprise.

'Of course I pay no attention to it. I have every confidence in you; I am sure you are doing the best you can for me—as you are, are you not?' added the unfortunate client, with a look of pitiful appeal, which would have softened the heart of any but a necessitous and perfectly unprincipled man. As it was, Mr Blackford experienced an unpleasant spasm in the place where his conscience used to be, before it had dwindled away like an unused muscle.

'Of course I am,' he replied. 'I hope you don't doubt it?'

'Oh, certainly not; on the contrary,' returned Willoughby, with a courteous bow. 'But last night they mentioned your name in a most unpleasant way. "He went to the wrong man when he went to Blackford." That was what one of them said. And another answered: "Yes, Blackford is altogether on our side. He'll spend all his money on Blackford, and get no good whatever." And they said—they said—I can't remember everything; but it was all to the same effect. Of course that kind of thing makes a man uneasy—naturally. Isn't it disgraceful that the law can do nothing to protect one from such persecution?'

Mr Blackford thought it best to laugh the matter off. 'Well,' said he jocularly, 'if we can but catch sight of them, I'll soon disabuse them of any such idea.—Don't you pay any attention to their nonsense. Of course they would like to put you off the scent. The rascals! I'd give a good deal to get fairly at them. It won't be long, now, before I do so. We are well on their track; and once we have them before the magistrate, we'll pay them out for all the trouble they've given us.'

Willoughby rose to go. 'I hope, as you say, that it will not be long now,' said he, with a doubtful and dissatisfied air. 'You see, it is wearing me out, and I have spent a good deal of money over it, besides. One of them threatened to kill me last night. If anything of that kind is to be attempted, they won't find me an easy victim, Mr Blackford! I shall try to be beforehand with them, at any rate. I'm not a man to be played with too long.'

And there was a look in the madman's eyes

as he spoke, and a kind of quiver through his brawny muscles, which seemed to say that the moment was fast approaching when playing with him would be a very risky amusement indeed.

'By George!' said the solicitor to himself, wiping his forehead, when he was once more alone, 'this is getting rather too warm. The fellow gave me quite a turn. If he takes that notion into his head, things may become awkward.' And Mr Blackford decided that the time had arrived for communicating with Willoughby's friends in Cape Town. He would have tried to induce the police to move in the matter at once; but this remedy, as he knew, was difficult and uncertain, and should it fail, would but add to the danger. He wrote off then and there, representing in feeling language the condition of his unfortunate client, which he stated he had only just discovered, and urging that some one should come to England immediately, with a view to putting the lunatic's person and property under proper control. Of course he said nothing about the money he had extorted for his phantom services. Fortunately, it was against his principles to give receipts unless they were demanded, which in this case they had not been, and all the payments had been made in cash; so he left it to be inferred that his exertions had been gratuitously rendered entirely from a sense of duty, and delicately hinted at their continuance on a different footing. Practice 'in Lunacy' is very lucrative; and Mr Blackford was not the man to neglect such chances as came in his way.

After this, owing to certain instructions which Mr Blackford gave to his staff, Willoughby found it surprisingly difficult to obtain a satisfactory interview with his solicitor. If he made an appointment by letter, Mr Blackford had always been unavoidably called out, and the time of his return was certain only in that it would be very late. If the client called unexpectedly, he always found the lawyer putting on his hat and gloves in a violent hurry, to attend some important appointment; and the interview was restricted to a short conversation as they walked through the streets, with ready assistance at hand on all sides. Willoughby's manner under this treatment grew more and more unsatisfactory. Jobson, the clerk, who knew nothing of the business in hand, never suspected the visitor's peculiar condition, and cheerfully assured him, according to orders, that all was going on well. But this did not satisfy him; and on the few occasions of his seeing the lawyer in person, he made that gentleman extremely uncomfortable by the growing gloom and wildness of his looks, and by persistent references to the hints of treachery which his mysterious foes continued to throw out.

Suddenly, he discontinued his visits. A fortnight went by, during which he made no sign; and then something happened which drove him entirely out of Mr Blackford's mind. This was the receipt of a letter written by Lucy Wedlake, at the request of her uncle, who wished to see his solicitor at once on important business. It was added that Mr Franklin had been seriously ill, but was now much better, and it was hoped that with care he would soon recover.

Mr Blackford found his client in his bedroom, propped up with pillows in a chair by the fire-side. It was evident at the first glance that he had received a heavy blow. His face was anxious and watchful, like that of one who expects from hour to hour the advent of a dreaded enemy, and fears to be taken unprepared. It was with little trace of his ordinary rough irritability, and with a tremulous and feeble voice, that he bade the solicitor sit down, for there was a deal to talk about. He had had 'an attack,' he said; the doctors told him it was the heart, and he must be very careful. They had to say something for their money, of course; still, it might be true. We must all go some time; and his time might be short. He had committed an injustice, which must be put right at once. His niece had done her duty by him, and he had broken his promise to her. It was his wish to make a fresh will at once, leaving her the whole of his property, according to his original intention.

'I've planned it all in my mind,' said he. 'It is to be for her alone, mind you; her husband shall never touch a penny that I can keep from him. He's an impudent upstart. He spoke to me as no man ever ventured to speak before; and I doubt he's brought me to my grave, through being upset the way I was. Take that pen and paper, Blackford, and set it down just as I tell you. The money is to be invested, and the income to be paid to my niece Lucy Wedlake as long as she lives; after her death, the capital is to be divided equally among the children. If she has no children, it's all to go to the Vintners' Company. That cuts out Thomas Wedlake, doesn't it? That's all right.—Now about yourself. I suppose you consider that you're an injured man, don't you—hey?'

To this question, put with some approach to Uncle Franklin's usual manner and tone, Mr Blackford found it difficult, in the then state of his emotions, to make any reply whatever. He managed to stammer out, with a ghastly attempt at a smile, that he was aware that he had no right to expect—

'No more you had,' interrupted Mr Franklin; 'that's very true; so there's little harm done. Though I don't say but what I'll do something for you too. That has happened to me which makes a man think of things he usn't to mind. Maybe I've no right to disappoint you altogether, after what I led you to expect. I might have employed another lawyer to make this will; but I thought you were entitled to have what business was to be got out of the thing. And you shan't say I was unhandsome. Put yourself down for a thousand pounds.'

Mr Blackford expressed his gratitude as well as he could, which was not very well; but it was a great deal more than he felt under the circumstances.

'You have named no trustees,' said he, recovering himself a little; 'it will be necessary to do so. I myself should be very happy'—

'No,' said the old man; 'I don't care for lawyers as trustees; they never seem to run straight. Let me see—put down William Brown, of the Stock Exchange, and James Harborton, of Leadenhall Street, merchant. Give them each a hundred pounds for their services. They won't

refuse to act when they find their names in the will; if they were to be asked beforehand, they'd say no; so don't you tell either of them till I'm gone. And talking of that—don't let my niece or any one else hear a word about this. I shall keep the will myself this time, and you will be the only person to know where it is to be found. Otherwise, they'll all be scrabbling after it as soon as the breath is out of me—perhaps before; and it may be a whim, but I don't like the notion. Lucy's a good sort; but then she is only a woman, and curious, like the rest of 'em. I shall tell her to send for you when the right time comes; and then you can lay your hand upon the will and do what's needful—which will bring a little more grist to your mill, to console you. Get the thing ready by to-morrow at this time, and bring it here with two witnesses, as before. Bring the old will as well; I wish to destroy it myself.'

'That is hardly necessary,' said the solicitor, catching at he knew not what straw of hope; 'it will be effectually revoked by the later document.'

'Don't you argue with me; do as I tell you. I say I shall destroy it with my own hands; then there can't be any question about it.—Don't fail to come to-morrow; I want to get it over. I don't think there's much time to waste. If you were to take me anywhere near a churchyard and lay me down, I doubt I shouldn't be in a hurry to get up again.'

Mr Blackford attempted a politely deprecatory murmur, but was testily interrupted. 'Oh, I daresay you won't be sorry to get your money. I'm tired talking. Mind you do just as I have told you.—Good-day.'

It was not until he found himself sitting in his own room, staring blankly at the opposite wall, that the solicitor realised the full weight of his misfortune. He had no feeling of anger; the blow, though he had all along had a lurking presentiment of it, was too cruel and staggering, now that it had fallen, to arouse any such emotion. He was bitterly disappointed. A thousand pounds! But a few months ago, a thousand pounds would have seemed a fortune, and the windfall would have set him planning innumerable ways of turning it to the best advantage. But what was it now to him, who had been deprived of the expectation of a sum which would have rendered all planning unnecessary, only to be resorted to as a recreation, for the remainder of his life? Nothing, and worse than nothing—a mere tantalising taste of the good fortune which ought in justice—so it really appeared to him—to have been his. And must he now give up all his hopes? Must he remain forever a mere plodding man of business of doubtful reputation—even with a thousand pounds of capital? Were the delights of unlimited leisure, of freedom from thought for the morrow, of unstinted gratification of animal appetites, of worldly consideration, never to be his, after all? He was fast approaching middle life; the time remaining to him for the enjoyment of all these things was growing shorter and shorter. To the purer pleasures of honest labour, to the noble ambition of building up a modest fortune by dauntless perseverance and undeviating rectitude, in the hope that some day, with folded hands,

he might fearlessly await the end in the quiet of an old age free from reproach—to all this he was utterly a stranger; nor would the prospect, had it been suggested, have at all allured him. His life had been one of poverty tempered by knaveries too petty to attract punishment; his dream of success had been one of sudden and unearned wealth, coming without effort, to be applied only to selfish gratification. To such men, crime, as crime, presents nothing repulsive; they abstain from it only so long as it offers no advantage commensurate with the risk. Given advantage and opportunity, crime follows with the certainty of a mathematical demonstration. He would not give way without a struggle. He could not. Something must be done. But what?

He opened his safe, and took out the will which was to have made him rich, and by that time to-morrow would be a mere piece of waste paper. He read it through, dwelling on every word with the bitterness of one who takes leave of hope for ever. When he came to the end, he gave a slight start of surprise—the date was blank. It had been left blank, he remembered, when the document was signed. He had intended to fill it in on his return to the office, but he had forgotten to do so. It should have been the 25th of November. What did it matter now! He threw the will on his desk with a despairing gesture, and walked up and down, trying to think. His brain was in a whirl; he could see no loophole of escape from the impending sacrifice. Then he remembered—and it came to him as an additional stab—that he had his bread to earn; whatever else he might do, he must at present carry out his client's instructions. He must with his own hands prepare the instrument which was to rob him—so he put it to himself—of his just expectations.

As he turned to the table, his eye again fell upon the blank space at the end of the will where the date should have been inserted; and at that moment, the crime which was to come to his aid stepped up softly behind him and whispered its first hint into his ear.

It was a revelation. Mr Blackford, as he sat and thought out the details, though by no means a religious man, almost considered it to be providential. No shrinking from the cruel wrong he was about to commit, no sentiment of justice or compassion interfered with his determination to avail himself of it to its fullest extent. He set to work at once. His first step was to walk across to the law-stationer and inform him that the writer who had witnessed a will on a former occasion would be required for a like service to-morrow. The testator, he explained, was the same; he was making a fresh will; he was an eccentric old gentleman, who insisted that the very persons who had attested the old will should also attest the new one; and he took the precaution of seeing the writer himself and making sure of his attendance. As he went back to the office, he warned Jobson that he, too, would be required for the same purpose.

He got down his books and set to work. He drew the new will with the greatest care and accuracy, according to the instructions which he

had just received. Everything was vested in the trustees named, in trust to pay the income to the testator's dear niece Lucy, the wife of Thomas Wedlake, for her life, for her separate use, free from the debts, control, or engagements of her present or any future husband. After her death, the fund was to be divided amongst her children as she should direct; in default of children, the whole to be paid to the Vintners' Company of London. Nothing was neglected; all the usual and proper powers and provisos were inserted with careful attention to detail.

The previous will he had fair-copied with his own hand, instead of handing it, to his clerk or law-stationer. He did the same in this case, though the document was longer and the transcription involved considerable labour. His next proceeding, in the eyes of another lawyer, would have seemed very enrious, for lawyers are extremely particular about the preservation, for future reference, of the draft of any deed or other document which they prepare; but the draft of this will Mr Blackford tore to fragments, which he afterwards burned in the grate. He was taking unusual pains, in fact, to carry out the testator's wishes, that no one beside himself and his solicitor should be aware of the contents of the will.

It was now past his usual lunch-time; and he strolled into the outer office, and sent his boy to get him a dry biscuit and a glass of brandy-and-water. Until this arrived, he stood chatting to Jobson on indifferent subjects; and then intimating to him that he was going to be extremely busy with private affairs, and must not be disturbed on any account whatever, he retired with his spare meal. He locked the door of his room behind him; he was about to enter on an important part of his operation. He took up the old will—that which was to be destroyed on the morrow—and examined it carefully as he ate and drank. It was copied on a piece of the paper known as 'demy;' it occupied the whole of the first page and four lines of the second. Then followed the long and cumbersome attestation clause, with Mr Franklin's straggling and irregular signature against it. Taking a paper of the same size, shape, and quality, the solicitor made an exact and laboured copy, or rather fac-simile. It had the same number of lines, and each line contained the same words as in the original. One or two unimportant erasures and carelessly formed letters were faithfully repeated. The signature, 'Wm. Franklin,' was transferred by means of tracing and carbonised paper, and then gone over and touched up with the pen, until a most successful imitation was produced. Two small blots, or rather splutters, had been made by the testator in writing his name. Their positions were accurately ascertained by measurement, their outlines transferred with the tracing-paper and then filled in with ink; a final touch of which Mr Blackford was reasonably proud, as indicating real genius. The result was a duplicate, which only a very careful scrutiny could have distinguished from the original of the will which was in his own favour. This ended his labours for the present.

Next day, Mr Blackford presented himself and his two witnesses before his client with the new will for signature. The old man, who was

in much the same condition, read it through for himself and expressed his approval. The usual formalities were gone through, and the witnesses dismissed.

'Now,' said Mr Franklin, 'have you brought the other will?'

'I have, as you requested me to do so,' said the solicitor, producing it; 'though, as I said at the time, it was not necessary.'

'Never mind,' said his client, taking it from his hand; 'it's just as well out of the way. How do I know what tricks a lawyer might be up to?'

To this speech, in Mr Franklin's best style, the solicitor made no reply; he was conscious of being 'up to tricks' of a rather elaborate nature. His client read the revoked will through with the same care as he had bestowed on that which superseded it. When he came to the signature, something about it seemed to arrest his attention; he turned it to the light and inspected it closely. Mr Blackford's heart thumped uncomfortably against his ribs.

'Curious!' said Mr Franklin slowly; 'I never knew myself to miss dotting an *i* before.'

He continued to pore over the signature, making grumbling comments, in an undertone, for some seconds, during which Mr Blackford felt an almost irresistible desire to snatch the document from him and knock his venerable head against the wall. At last, to the solicitor's intense relief, he tore it across and across, and threw it upon the fire, where it was quickly destroyed.

'That's done with,' said Mr Franklin. 'The next thing is to put this one away where no one but you and I will know where to find it. I prefer to keep it here, because then I shall know it's all safe. As to the last, it didn't so much matter; you were the person most interested in its safety, so it was very well that you should have the custody of it. It's different now.—D'y'e see that half-dozen of books on the shelf in the recess? At this end, you'll find a big old, illustrated Prayer-book. Put the will ~~in~~ there, and remember the page.'

Mr Blackford took down the book, which opened of itself—casually enough—at the service for the Burial of the Dead. He did not mention this circumstance, but put the folded paper in its place and closed and replaced the volume.

'That's well,' said Mr Franklin in a weary voice. 'I'm weaker than I thought; all this has tired me out.—Good-bye, Blackford; shake hands. You'll do your part at the proper time; I shall tell 'em to send for you. Don't forget—the old Prayer-book at this end of the shelf.'

'I won't forget,' replied the lawyer; 'but I hope it may be many a long day yet before I am called on to remember.—Good-bye, sir.'

Uncle Franklin did not reply; he was lying back on his pillows with closed eyes; and so Mr Blackford left him.

The first steps of his scheme had been well planned, well carried out, and had met with entire success. He had been obliged, it is true, to forge a duplicate of the former will; but the forgery had just been put out of evidence by the testator himself. There was nothing to bear witness against him on that score. There were now two wills in existence, both bearing the

testator's genuine signature, both attested by the same witnesses, and both dated—or shortly to be dated—on the same day; the only difference between them being the trifling one, that the will which was between the leaves of the old Prayer-book was in favour of Lucy Wedlake, while that which remained in Mr Blackford's possession constituted him the sole legatee. The witnesses, having merely signed their names to two documents of very similar appearance on two different occasions, would be quite unable to say which they had last attested, for they knew nothing of the contents of either.

So far, so good. What was to be the next step? That, as Mr Blackford perceived, was a matter requiring very careful consideration.

BIG UNDERTAKINGS.

Nothing seems too big for the present age, for we are continually being startled with something new and something immense, which has either been just completed, or is about to be carried out, or, at anyrate, is projected or proposed. Within the last few weeks three new schemes have been either commenced or suggested in Switzerland, Greece, and Canada. The first-named scheme in Switzerland is proposed by an Italian engineer named Agudio, of Milan, for making a way through the Simplon, which he declares he can do by a tunnel of only six thousand and fifty metres, the traction and haulage being done by hydraulic power. He says that by this means from three to four thousand tons of goods could be safely transported without any breaking-up or transhipment of trains; while the cost of the whole proceeding would be only twenty-eight millions of francs.

Number Two project consists of the bold but practical scheme of draining the Lake of Copas, near Thebes, in Boetia, by which an area of a hundred square miles will be added to the territory of Greece. The acquiring of so very large a piece of land, which may be put to useful purposes, though undoubtedly one of vast importance, is not the only object intended to be effected by the proposal—the other being the destruction of one of the greatest fever-producing places in the country by reason of the pestilential malaria always arising from the waters of this lake. This alone would be an unspeakable blessing to the country round, and money should be readily forthcoming for the carrying out of so beneficial an undertaking. The rivers now flowing into the lake would be employed for irrigation and other purposes of practical utility.

Number Three project proposes to connect Prince Edward Island with the Canadian mainland by means of a submarine railway tunnel, by which all communication can be kept open with the inhabitants of the island during the winter, a circumstance at present almost impossible, from the terribly rigorous nature of the winter climate of Canada; but Canada is bound legally to do everything that is possible to keep open a communication with this island at all times and by all means, for the accommodation and assistance of the hundred and twenty-five thousand persons who constitute the present population. The distance of the island is only six miles and a half, and the bed of the Northumberland Straits,

under which the railway will be carried, presents no very apparent difficulties. The depth of water is on the island side thirty-six feet; and ten feet six inches on the New Brunswick side; and about eighty feet in the middle. The tunnel will be eighteen feet in diameter, and will be made of 'chilled white cast-iron,' in sections, these latter being bolted together with inside flanges, exactly in the same way in which the little tunnel for foot-passengers under the Thames, and known as the 'Tower Subway,' was constructed some years ago. The cost of this undertaking is estimated at about one million sterling. It has been well considered and highly commended, and will be brought before the Canadian parliament very speedily, when the scheme will no doubt be fully sanctioned, as it has many warm supporters in the Legislative Assembly. Canada will therefore have her 'submarine railway' long before her illustrious 'mother' on this side the Atlantic.

AUTUMN DAYS.

A WEALTH of beauty meets my eye—
Yellow and green, and brown and white,
In one vast blaze of glory fill
My happy sight.

The rich-robed trees, the ripening corn,
Bright coloured with September fire—
Fulfillment of the farmer's hope,
And year's desire.

Sweet in the air are joyous sounds
Of bird and bee and running brook;
And plenteous fruits hang ripening round,
Where'er I look.

The mellow splendour softly falls
On morning mists and evening dews,
And colours trees and flowers and clouds
With thousand hues.

O dreaming clouds, with silver fringed!
I watch ye gathering side by side,
Like armies, in the solemn skies,
In stately pride.

I love the woods, the changing woods,
Fast deepening down to russet glow,
When Autumn, like a brunette Queen,
Rules all below.

The soul of Beauty haunts the heavens,
Nor leaves for long the warm-faced Earth,
And like a mother, the kind air
To life gives birth.

But Death rides past upon the gale,
And blows the rustling golden leaves;
They whirl and fall, and rot and die,
And my heart grieves.

Farewell! O Autumn days—farewell!
Ye go; but we shall meet again,
As old friends, who are parted long
By the wild main.

PRICE 1½d.

A YEAR'S POSTAL WORK.

GOVERNMENT Blue-books, to an ordinary reader, are tedious and uninteresting enough; but even to the most ordinary of readers, the annual Report of the Postmaster-general is at once curious and interesting. Baron von Liebig once affirmed that the commercial prosperity of a country was to be gauged by the sale of chemicals. This may or may not be true; but we think the growth of the postal system in all its multifarious branches—the amount of the deposits in the savings-banks; the purchase of annuities and life policies; the amount of money transmitted by means of postal orders; the correspondence, growing by leaps and bounds, with all parts of the globe; the countless telegrams—those flashing messengers of joy and despair, good and ill—and last, but by no means least, the thousands of millions of letters annually delivered in the United Kingdom alone—all these are a sure index, not only of the commercial growth and prosperity of the nation, but also of the spread of education. A brief résumé of the Postmaster-general's Report for the year ending March 31, 1886, may prove interesting to our readers.

The number of letters delivered in the United Kingdom alone reaches the astounding total of 1,403,547,900, this being an increase of 3·2 per cent., and giving an average to each person of 38·6. If we add to this the post-cards, book-packets, circulars, newspapers, and parcels transmitted by the postal authorities, we have a grand total of 2,091,183,822, an increase of 4·2 per cent.; and an average to each person of 57·5. Of this total, 84 per cent. were delivered in England and Wales (27·4 per cent. being delivered in the London postal district alone), 9·6 per cent. in Scotland, and 6·4 per cent. in Ireland. It will be at once seen that the necessary staff for the successful carrying out of such a colossal undertaking must be on a like scale; and this is the case, the total number of officers on the permanent staff being about 51,500, showing an increase

during the past year of 3310. Of this small army 3456 are women. In addition to these there are, it is estimated, about 45,000 persons of private occupations, who are employed to assist in carrying on the operations of the department during a portion of the day. An increase of business brings a decrease in charge, this again inducing a fresh increase; thus, it has become possible to reduce the rate of postage on letters exceeding twelve ounces in weight, from one penny per ounce to a halfpenny per two ounces; a letter thus weighing fifteen ounces formerly cost 1s. 3d., whereas it can now be sent for 5d. The natural result is a large increase in the number of such letters.

We now come to the latest branch from the parent stem—the parcel post. It is highly satisfactory to learn that there has been an increase in the parcels carried of about three and a half millions, giving an increase in money of £84,000. In England and Wales, 22,198,000 parcels were despatched; in Scotland, 2,690,000; and in Ireland, 1,527,000. The list of provinces and countries to which parcels can be sent has also been enlarged. We learn that the first despatch of foreign and colonial parcels took place on the 1st of July 1885; and by the 1st of January 1886, arrangements had been completed for the interchange of parcels with twenty-seven different countries. The total number despatched up to the 31st of March was 71,900, and the number received, 40,800. The largest business was transacted with Germany, with which country in six months 46,000 parcels were exchanged. India shows a business at the rate of 36,000 parcels in the six months; and the smallest business recorded is one parcel in three months for the island of Tortola.

An amusing article might very well be written on postal curiosities, and the authorities might make a most interesting museum of the various articles committed to their care. This museum, we venture to suggest to the Postmaster-general, might be thrown open to the inspection of the public at a small fee, and might help to swell the

receipts of the department. We read that at the commencement of the parcel post with Belgium, several cages of live birds were received; but the despatch of live birds being contraband, a veto was put upon the practice. On other occasions, a live pigeon, a live fowl, and no fewer than a hundred and fifty live frogs, passed through the postal hands; while such unpleasant, not to say aggressive, passengers as wild bees and snakes were transmitted in numbers apparently 'too numerous to mention.' In all these cases the contents of the parcels were detected and retained; but it is fair to assume that many other packages containing other curiosities passed through unchallenged. Among the contents of parcels received in the Returned Letter Office in Dublin, having been stopped as contraband, were two hens, eight mice, and two hedgehogs. One of the hens was an invalid, and in a bad state of health; and was addressed to a veterinary surgeon in London, whom, doubtless, she wished to consult. Every possible care was taken of the interesting invalid, but all efforts were unavailing—she died in the office! Let us turn to the brighter side of the picture—the remaining hen, as also the mice and hedgehogs, were delivered to their owners 'safe and sound in wind and limb.' Possibly the moribund fowl was sent, to the 'Dead Letter' Office.

A few amusing incidents which have occurred in the Returned Letter Office are given in the Report. They are so curious and few, that they but serve to whet our appetite. The number of returned letters, &c., received in the office was 12,822,067, an increase of 4·7 per cent. over the previous year. Of this number, 441,765 were hopelessly unreturnable, as many as 26,928 being posted *without any address*, and of the latter number, 1620 contained in cash and cheques the astonishing amount of £3733, 17s. 6d. This reveals a carelessness which is as extraordinary as it is culpable. Should any letter or package go astray, the department is invariably blamed, and the honesty of the letter-carriers impugned; but the following instance shows where the blame should sometimes be laid. 'Complaint was made last year at Liverpool that a packet containing a bottle of wine and a box of figs had been duly posted, but not delivered. Upon further inquiry, the sender ascertained that the person to whom the packet was intrusted to post, had eaten the figs and drunk the wine.' Again, the department was blamed because a certain letter addressed to 'Mrs Jones, Newmarket, near Blyth,' did not reach its destination. It appeared, however, that no less than twenty-nine ladies residing at that place, owned that interesting but by no means uncommon name, and the postal authorities were unable to decide which was the Mrs Jones. Another letter was received in Glasgow addressed as follows: 'Mrs —, 3 miles from where the cattle is sold on the Duke of Buccleugh's ground.'

Two letters were alleged to be missing in Scotland. Inquiry was made at the address of the first letter, which, being registered, was undoubtedly delivered; when, after half an hour's search, it was discovered amongst an accumulation of twelve months' letters heaped upon a desk. The second letter was put into the box at the correct address; this box was cleared by a charwoman every Monday. Having failed to

notice it one Monday, it lay till the following Monday. Another charge was more serious. A letter containing a cheque for a considerable sum of money and duly posted was missing; the postal authorities were accused of the theft. The charge was, however, cleared up, and the letter-carrier's honesty vindicated in so strange a manner, that we quote the Report itself for authority. 'It was ultimately found amongst the straw of a kennel, torn into fragments, but no pieces missing. The postman had duly delivered the letter, having, at the request of the addressee, pushed it with others under the front-door; and some puppies had carried it to the kennel and torn it.' Moral—Do not be quick to accuse, lest thereby you condemn the innocent; and be careful to have a proper letter-box.

Perhaps, to the political economist, the most interesting portion of the Report is that which deals with the Post-office Savings-bank. It is highly satisfactory to learn that the business of this department shows a considerable increase during the year. The total amount due to depositors on the 31st of December was £47,697,838, an increase of £2,924,065 over the previous year. In addition to this, the balance of government stock held by depositors at the close of the year was £2,452,252; making the total amount due to depositors £50,150,090, this being distributed over 3,535,950 separate accounts. The greatest number of deposits made in one day was 48,568, on the 31st of January, amounting to £99,913; but the largest amount deposited in one day was on the 1st of January, and amounted to £124,843. The greatest number of withdrawals in one day, 20,835, amounting to £90,643, was on the 22d of December; but the largest amount, £86,981, was withdrawn on the 16th of December. The average amount of each deposit was £2, 6s. 5d.; of each withdrawal, £5, 15s. 10d. The number of accounts remaining open at the end of the year is thus divided:

Number.	Prop. to Pop.	Av. balance due to each depositor.
		£ s. d.
England and Wales...	3,272,701	1 to 8 13 10 8
Scotland.....	127,172	1 to 31 7 12 6
Ireland.....	135,777	1 to 36 17 19 2

The life-insurance business shows an increase during the year of 109 in number, and of £13,003 in amount.

The inland money-order business continues to diminish; this is owing to the introduction of postal orders, which took place in 1880, since which date the annual number issued has been decreased by about six millions. On the other hand, with the colonies, and in both directions with foreign countries, there has been a 'satisfactory increase.' The Report recommends the use of money orders in preference to postal orders, in spite of their involving more trouble, on the ground of the greater security. It appears there is 'a frequent or almost universal omission on the part of the public to take so ordinary a precaution as to fill in the name of the person to whom the order is payable, and the office at which it should be cashed.' It goes on to add that a proposal to reduce the rates will shortly be under consideration. The orders issued in India and the colonies show an increase of 29,000 in number, amounting to £18,000;

while the increase in the orders issued on board Her Majesty's ships is as many as 67,900, or, in cash, £43,400.

The telegraph department's figures do not so readily lend themselves to comparison, as during the last six months the sixpenny rate has been in force. Comparing the last six months with the corresponding period in the year 1884-85, we have an increase of 48 per cent., and a decrease of £40,233 in the revenue; but against this loss must be placed the sum of £18,214 received on account of the large additional number of abbreviated telegraph addresses; this reduces the loss caused by the reduced rate to £22,019. The increase in the number of local messages in London alone was no less than 74 per cent. The twenty-seven telephone exchanges have now 1255 subscribers; and since the 1st of April 1883 we are told that some 1400 miles of line have been laid, for which some 29,000 miles of wire and £64,000 worth of red fir poles from Norway have been used. The pneumatic-tube system, too, is coming still more into use, and a rate of speed has been attained varying between seventeen and thirty-four miles an hour according to circumstance.

The gross revenue for the year was £10,278,865; while the gross expenditure was £7,569,983; the net revenue, therefore, was £2,708,882, being an increase of £62,584 on the previous year.

New post-offices have been opened in 371 places in the United Kingdom, and about 860 letter-boxes been added. Not only have Her Majesty's liegesses had their letters carried and their parcels delivered with speed and almost unflinching accuracy, but, after all expenses have been deducted, the postal arrangements have been so satisfactorily carried out, that the public purse has been swelled by a profit of over £2,700,000.

IN ALL SHADES.

CHAPTER XLVII.

WHEN Mr Dupuy heard from his daughter's own lips the news of her engagement to Harry Noel, his wrath at first was absolutely unbounded; he stormed about the house, and raved and gesticulated. He refused ever to see Harry Noel again, or to admit of any proffered explanation, or to suffer Nora to attempt the defence of her own conduct. He was sure no defence was possible, and he wasn't going to listen to one either, whether or not. He even proposed to kick Harry out of doors forthwith for having thus taken advantage in the most abominable manner of his very peculiar and unusual circumstances. Whatever came, he would never dream of allowing Nora to marry such an extremely ungentelemanly and mean-spirited fellow.

But Mr Dupuy didn't sufficiently calculate upon the fact that in this matter he had another Dupuy to deal with, and that that other Dupuy had the indomitable family will quite as strongly developed within her as he himself had. Nora stuck bravely to her point with the utmost resolution. As long as she was not yet of age, she said, she would obey her father in all reasonable

matters; but as soon as she was twenty-one, Oranga Grova or no Orange Grove, she would marry Harry Noel outright, so that was the end of it; and having delivered herself squarely of this profound determination, she said not a word more upon the subject, but left events to work out their own course in their own proper and natural fashion.

Now, Mr Dupuy was an obstinate man; but his obstinacy was of that vehement and demonstrative kind which grows fiercer and fiercer the more you say to it, but wears itself out, of pure inanition, when resolutely met by a firm and passive silent opposition. Though she was no psychologist, Nora had hit quite unconsciously and spontaneously upon this best possible line of action. She never attempted to contradict or gainsay her father, whenever he spoke to her angrily, in one of his passionate outbursts, against Harry Noel; but she went her own way, quietly and unobtrusively, taking it for granted always, in a thousand little undemonstrative ways, that it was her obvious future rôle in life to marry at last her chosen lover. And as water by continual dropping wears a hole finally in the hardest stone, so Nora by constant quiet side-hints made her father gradually understand that she would really have Harry Noel for a husband, and no other. Bit by bit, Mr Dupuy gave way, sullenly and grudgingly, convinced in his own mind that the world was being rapidly turned topsy-turvy, and that it was no use for a plain, solid, straightforward old gentleman any longer to presume single-handed upon stemming the ever-increasing flood of revolutionary levelling sentiment. It was some solace to his soul, as he yielded slowly inch by inch, to think that if for once in his life he had had to yield, it was at least to a born Dupuy, and not to any pulpy, weak-minded outsider whatever.

So in the end, before the steamer was ready to sail, he had been brought, not indeed to give his consent to Nora's marriage—that was more than any one could reasonably have expected from a man of his charge—but to recognise it somehow in an unofficial dogged fashion as quite inevitable. After all, the fellow was heir to a baronetcy, which is always an eminently respectable position; and his daughter in the end would be Lady Noel; and everybody said the young man had behaved admirably on the night of the riot; and over in England—well, over in England it's positively incredible how little right and proper feeling people have got upon these important racial matters.

'But one thing I will not permit,' Mr Dupuy said with decisive curtness. 'Whether you marry this person Noel, Nora, or whether you don't—a question on which it seems, in this new-fangled order of things that's coming up nowadays, a father's feelings are not to be consulted—you shall not marry him here in Trinidad. I will not allow the grand old name and fame of the fighting Dupuys of Oranga Grove to be dragged through the mud with any young man whatsoever, in this island. If you want to marry the man Noel, miss, you shall marry him in England, where nobody on earth will know anything at all about it.'

'Certainly, papa,' Nora answered most demurely. 'Mr Noel would naturally prefer the

wedding to take place in London, where his own family and friends could all be present; and besides, of course there wouldn't be time to get one's things ready either, before we leave the West Indies.'

When the next steamer was prepared to sail, it carried away a large contingent of well-known residents from the island of Trinidad. On the deck, Edward and Marian Hawthorn stood waving their handkerchiefs energetically to their friends on the wharf, and to the great body of negroes who had assembled in full force to give a parting cheer to 'de black man fren', Mr Hawthorn. Harry Noel, in a folding cane-chair, sat beside them, still pale and ill, but bowing, it must be confessed, from time to time a rather ironical bow to his late assailants, at the cheers, which were really meant, of course, for his more popular friend and travelling companion. Close by stood Nora, not sorry in her heart that she was to see the last that day of the land of her fathers, where she had suffered so terribly and dared so much. And close by, too, on the seat beside the gunwale, sat Mr and Mrs Hawthorn, the elder, induced at last, by Edward's earnest solicitation, to quit Trinidad for the evening of their days, and come to live hard by his own new home in the mother country. As for Mr Dupuy, he had no patience with the open way in which that man Hawthorn was waving his adieux so abominably to his fellow-conspirators; so, by way of escaping from the unwelcome demonstration, he was quickly ensconced below in a corner of the saloon, enjoying a last parting cigar and a brandy cocktail with some of his old planter cronies, who were going back to shore by-and-by in the pilot boat. As a body, the little party downstairs were all agreed that when a man like our friend Dupuy here was positively driven out of the island by coloured agitators, Trinidad was no longer a place fit for any gentleman with the slightest self-respect to live in. The effect of this solemn declaration was only imperceptibly marred by the well-known fact that it had been announced with equal profundity of conviction, at intervals of about six months each, by ten generations of old Trinidad planters, ever since the earliest foundation of the Spanish colony in that island.

Just two months later, Mr Dupuy was seated alone at his solitary lunch in the London club to which Harry Noel had temporarily introduced him as an honorary guest. It was the morning after Nora's wedding, and Mr Dupuy was feeling naturally somewhat dull and lonely in that great unsympathetic world of London. His attention, however, was suddenly attracted by two young men at a neighbouring table, one of whom distinctly mentioned in an audible tone his new son-in-law's name, 'Harry Noel.' The master of Orange Grove drew himself up stiffly and listened with much curiosity to such scraps as he could manage to catch of their flippant conversation.

'O yes,' one of them was saying, 'a very smart affair indeed, I can tell you. Old Sir Walter down there from Lincolnshire, and half the smartest people in London at the wedding breakfast. Very fine fellow, Noel, and comes in to one of the finest estates in the whole of England. Pretty little woman, too, the bride—nice little girl, with such winning little baby features.'

'Ab!' drawled out the other slowly. 'Pretty, is she? Ab, really. And pray, who was she?'

Mr Dupuy's bosom swelled with not unnatural paternal pride and pleasure as he anticipated the prompt answer from the wedding guest: 'One of the fighting Dupuys of Trinidad.'

But instead of replying in that perfectly reasonable and intelligible fashion, the young man at the club responded slowly: 'Well, upon my word, I don't exactly know who she was, but somebody colonial, any way, I'm certain. I fancy from Hong-kong, or Penang, or Demerara, or somewhere.—No; Trinidad—I remember now—it was certainly either St Kitts or Trinidad. Oh, Trinidad, of course, for Mrs Hawthorn, you know—Miss Ord that was—wife of that awfully clever Cambridge fellow Hawthorn, who's just been appointed to a permanent something-or-other-ship at the Colonial Office—Mrs Hawthorn knew her when she was out there during that nigger row they've just been having; and she pointed me out the bride's father, a snuffy-looking old gentleman in the sugar-planting line, over in those parts, as far as I understood her. Old gentleman looked horribly out of it among so many smart London people. Horizon apparently quite limited by rum and sugar.—O yes, it was a great catch for her, of course, I needn't tell you; but I understand this was the whole story of it. She angled for him very cleverly; and, by Jove, she hooked him at last, and played him well, and now she's landed him and fairly cooked him. It appears, he went out there not long before this insurrection business began, to look after some property they have in the island, and he stopped with her father, who, I daresay, was accustomed to dispensing a sort of rough-and-ready colonial hospitality to all comers, gentle and simple. When the row came, the snuffy old gentleman in the sugar-planting line, as luck would have it, was the very first man whose house was attacked—didn't pay his niggers regularly, they tell me; and this young lady, posing herself directly behind poor Noel, compelled him, out of pure politeness, being a chivalrous sort of man, to fight for her life, and beat off the niggers single-handed for half an hour or so. Then he gets cut down, it seems, with an ugly cutlass wound: she falls fainting upon his body, for all the world like a Surrey melodrama; Hawthorn rushes in with drawn pistol and strikes an attitude; and the curtain falls: tableau. At last, Hawthorn manages to disperse the niggers; and my young lady has the agreeable task of nursing Noel at her father's house, through a slow convalescence. Deuced clever, of course: makes him save her life first, and then she helps to save his. Has him both ways, you see—devotion and gratitude. So, as I say, she lands him promptly: and the consequence is, after a proper interval, this smart affair that came off yesterday over at St George's.'

Once more the world reeled visibly before Mr Dupuy's eyes, and he rose up from that hospitable club table, leaving his mutton outlet and tomato sauce almost untasted. In the heat of the moment, he was half inclined to go back again immediately to his native Trinidad, and brave the terrors of vivisection, rather than stop in this atrocious, new-fangled, upsetting England,

where the family honours of the fighting Dupuys of Orange Grove were positively reckoned at less than nothing. He restrained himself, however, with a violent effort, and still condescends, from summer to summer, fitfully to inhabit this chilly, damp, and unappreciative island. But it is noticeable that he talks much less frequently now of the Dupuy characteristics than he did formerly (the population of Great Britain being evidently rather bored than otherwise by his constant allusions to those remarkable idiosyncrasies); and some of his acquaintances have even observed that since the late baronet's lamented decease, a few months since, he has spoken more than twice with apparent pride and delight of 'my son-in-law, Sir Harry Noel.'

It is a great consolation to Tom Dupuy to this day, whenever anybody happens casually to mention his cousin Nora in his presence, that he can rub his hands gently one over the other before him, and murmur in his own peculiar drawl: 'I always told you she'd end at last by marrying some confounded woolly-headed brown ruan.'

THE END.

REBEL-CATCHING.

WE were in camp, and our chief was a very distinguished officer of middle age, who had won his first spurs in the Indian Mutiny, and had been winning additional spurs ever since. We were a small party, which perhaps partly accounted for the chief's communicativeness, for to induce him to narrate any of his own experiences under ordinary circumstances was well nigh an impossibility. Be this as it may, on this occasion he did abate a little of his habitual reserve, and though he would not even hint at one of the score of incidents in which his coolness and gallantry had been almost historical, still, what he did tell us may be of some general interest. Moreover, to the best of my knowledge—and I can claim something more than a nodding acquaintance with the literature of the Sepoy Revolt—the two following stories have never been even alluded to in print. I am sorry I cannot recollect the exact words in which they were told; but I will do my best, and will only ask that any deficiencies in the narrative may be attributed to me, and not to the anonymous speaker.

'Talking of catching rebels reminds me that I had a good deal to do in that line in the Mutiny days. I was only a youngster, not much more than a boy at the time; but I suppose I was rather zealous and active, for I was given a small independent command, a troop of native cavalry and a handful of infantry, and posted near the Nepal frontier to look out for rebels. This was quite at the fag-end of the Mutiny; and my chief duty was to catch, if possible, one or two noted scoundrels who had hitherto escaped, and who, it was supposed, might try to take refuge in the Nepal valley. Amongst the objects of my especial solicitude was a subahdar [native officer] who had taken a prominent part in the massacre of women and children at Cawnpore. I had full permission to shoot this bound if only I could catch him; and I waited longingly for some tidings of his whereabouts. At last, one evening a native arrived

at my post, and declared that the subahdar was lying hid in a village some little distance off, on the Nepal side of the frontier. I had got my chance, and I was not going to lose it by delay. Getting together my troop of cavalry, I made a night-march to the village, and in the very early morning, before any of the inhabitants were stirring, I drew a cordon round it, and waited. When day broke, I sent a message to the head-man of the village and explained matters. I called upon him to deliver up the subahdar, and pointed out that I was master of the situation. To my disgust, the head-man declared that he could not give up the subahdar, for the simple reason that he was not in the village at all. However, my information had been trustworthy, and I did not like the idea of having had a long and troublesome march for nothing, so I ordered a search. This was accordingly made, but with no results except that of putting me into a rather bad temper. Finally, I said to the head-man that every single inhabitant of the place should turn out by a given time that day, or I would burn the village over their heads. The head-man sorrowfully consented; and man, woman, and child evacuated the huts, after which the troopers scoured the village in their endeavours to find their man. But not a sign of him was present, and I began to feel that I had been belied. Somewhat sick at heart, I ordered my troopers to stop searching and to prepare for the return march.

'As the troopers were trotting up to fall in, one of them happened to pass a small hut in which was a heap of most innocent-looking but not very savoury rubbish. Through the doorway the trooper casually poked his lance at this heap, more for swagger or to show his zeal than with any hope of making a discovery. Suddenly, up from the rubbish jumped a scared figure, who was promptly caught and brought to me. It was the subahdar!'

The speaker went on to say that they made short work of the scoundrel, who had reddened his foul hands with the blood of English ladies and children. He had his trial; but the evidence was conclusive, and mercy was out of the question. The subahdar was shot; and when one reads the details of the two massacres at Cawnpore, one is tempted to think that the death was too good for him. Our chief concluded this episode by noting that he subsequently had no difficulty in explaining to the Nepalese authorities his conduct towards the villagers, which had been, to say the least, somewhat brusque. These authorities looked upon the matter as rather humorous than otherwise, and certainly not worthy of serious notice.

'Another curious thing happened to me,' continued the chief, 'during the time that I was rebel-hunting. One day I caught a criminal with a very peculiar face, one that I could not help remembering rather more clearly than I generally remember the countenances of natives. This particular rebel had done something particularly bad, and had to be shot without delay. I gave the necessary orders for a firing-party to be formed, and the execution was duly carried out. Something prevented me from being actually present on the ground, but there was a native officer, and my men were presumably to be

trusted. I remember distinctly hearing the volley delivered by the firing-party, and when I subsequently inquired whether everything had been all right, it was reported to me that the man was dead.

"About a fortnight afterwards, a man was brought in to me whose face seemed strangely familiar. Suddenly it flashed on my mind that this was the very man whose death-knell I had heard only a few days ago. Looking at him closely, I said: "How is this? Who are you? Surely I had you shot a fortnight ago?"

"It is true, *sahib*," said the poor wretch. "I am the man your soldiers caught, and I was brought before your honour, and you ordered me to be shot. I was taken out, and they stood me on the edge of a *nala* [a dried-up water-course], and fired. *Sahib*, they hit me; but I was not dead, and I dropped into the *nala* and crept away. Your soldiers never came to look for me, and I escaped. By evil chance, I have been captured again. But, *sahib*, do not order me to be shot again."

"No," said I; "I will not do that—not this time, at any rate. You are free, and had better make the best use of your legs. But if I catch you again, I shall really be obliged to have you shot in downright earnest. Be off, and take care you don't fall a third time into my hands."

"And he didn't!"

Our chief commented on the native's tale of his hairbreadth escape as being what Yankees would call "rather thin." He seemed himself to think that the firing-party had been tampered with, a contingency which he had, in his subsequent rebel-catching adventures, taken care to avert.

BY ORDER OF THE LEAGUE.

CHAPTER III.

LE GAUTIER was not far wrong in his estimate of Carlo Visci. The gamester he former was playing was a dangerous one. He had met the youthful Genevieve in one of his country excursions, and, struck by her beauty, conceived the idea of finding some slight amusement in her society. It was not hard, in that quiet place, with his audacity and talents, to make himself known to her; nor did the child—for she was little more—romantic, passionate, her head filled with dreams of love and devotion, long remain cold to his advances. Friendship soon ripens into love in the sunny South, where temperaments are warmer, and the cold restraints of northern society do not exist. The Frenchman had no sinister intentions when he commenced his little flirtation—a mere recreation *pour passer le temps* on his side; but alas for good intentions; the moth may not approach too near the flame without scorching its wings. Begun in playfulness, almost sport, the thing gradually ripened into love—love such as most women never know, love encountered by keen wit and a knowledge of the evil side of life. When the story opens, Genevieve had known Le Gautier for six months—had known him, loved him, and trusted him.

But Le Gautier was already tired of his broken toy. It was all very well as a pastime;

but the gilded chains were beginning to chafe, and besides, he had ambitious schemes into which any calculations of Genevieve never entered. He had been thinking less of dark passionate eyes lately than of a fair English face, the face of Enid Charteris; so in his mind he began to revolve how he could best free himself from the Italian girl, ere commencing his campaign against the heart and fortune of Sir Geoffrey Charteris' heiress. Come what may now, he must file his fetters.

Filled with this virtuous and manly resolution, he set out the following afternoon for the Villa Mattio. It was Visci's whim to keep his sister there, along with a younger sister, a child as yet, little Lucrece, both under the charge of a sleepy old *gouvernante*. In spite of his faults, Visci was a good brother, having too sincere an affection for his sister to keep her with him among the wild student spirits he affected, fearing contamination for her mind. And so she remained in the country; Visci running down from the city to see her, each time congratulating himself upon the foresight he had displayed in such an arrangement as this, little thinking he had thus caused the greatest evil he had to fear.

Le Gautier walked on till the white façade and stucco pillars of the villa were in sight, and then, striking across a little path leading deep into a thick shady wood, all carpeted with spring flowers, threw himself upon the grass to wait. There was a little shrine here by the side of a tiny stream, with the crucifix and a rude stone image of the Virgin in a dark niche; evidently a kind of rustic woodland sanctuary. But Le Gautier did not notice these things as he lay there; and there was a frown upon his brow, and a thoughtful, determined look upon his face, which boded ill for some one.

He had not long to wait. Pushing the branches of the trees aside and coming towards him with eager, elastic step, was a girl. She was tall and slight; not more than seventeen, in fact, and her dark eyes and clear-cut features gave promise of great beauty. There was a wistful, tender smile upon her face as she came forward—a smile tinged with pain, as she noted the moody face of the man lying there, but nevertheless a smile which betokened nothing but perfect, trusting, unutterable love. Le Gautier noted this in his turn, and it did not tend to increase his equanimity. It is not easy for a man, when he is going to commit a base action, to preserve his equanimity when met with perfect confidence by the victim. For a moment she stood there, looking at him, neither speaking for a brief space.

"How ridiculously happy you look, Genevieve," Le Gautier said irritably. "It is a great compliment to me, but—"

The girl looked at him shyly, as she leant against a tree, the shafts of light through the leaves playing upon her lustrous coronal of dusky hair and showing the happy gleam in her eyes. "I am always contented when you are here, Hector," she answered softly.

"And never at any other time, I suppose?"

"I cannot say that. I have many things to do, but I can always find time to think of you. I dwell upon you when you are away, and

think what I should do if you were to leave me. Ah, yes, I know you will not do that; but if you did, I should die.'

Le Gautier groaned inwardly. Time had been when he had dwelt with pleasure on these outpourings of an innocent heart.

'You are not one of the dying order of heroines, Genevieve. By no means. And so you oftentimes wonder what you would do if I were to leave you?'

The girl half started from her reclining position, with her scarlet lips parted, and a troubled expression on her face. 'You speak very strangely to-day, Hector,' she exclaimed. 'What do you mean?'

'Precisely what I say. You are anxious to know how you would feel if I left you. Your curiosity shall be gratified. I am going to leave you.'

'To leave me! Going away, Hector, and without me?' Genevieve wondered vaguely whether she heard the words aright. She started and pressed her hand to her heart, as if to still its rebellious beating. Going away? The warmth seemed to have departed from the scene, the bright light grew dim as gradually the words forced themselves upon her; and the cold numbness of despair froze her trembling limbs.

'Yes, I am going away,' Le Gautier repeated in a matter-of-fact manner, but always with his eyes anywhere but on the girl's face. 'Indeed, I have no alternative; and as to taking you with me, it is impossible.'

'I have dreamt of something like this,' Genevieve intoned in a low vague voice, her look seemingly far away. 'It has been forced upon me, though I have tried not to think so, that you have been growing colder day by day. And now you come and tell me that you are going to leave me! There is no regret in your voice, no sorrow in your face. You will go away and forget, leaving me here in my sorrow, mourning for my lost love—leaving me here heartbroken—deceived!'

'You should go on the stage,' Le Gautier replied sardonically. 'Your talents are wasted here. Let me assure you, Genevieve, speaking as a man who has had a little experience, that if you can get up a scene like this upon the boards, there is money in it.'

'You are cruel!' the girl cried, dashing her tears away impetuously—'you are cruel! What have I done to deserve this from you, Hector? You wish to leave me; that you will not come back again, my heart assures me.'

'Your heart is a prophetic organ, then, *cara mia*. Now, do look at the thing in a rational light. I am under the orders of the League; to disobey is death to me; and to take you with me is impossible. We must forget all our little flirtations now, for I cannot tell when I may be in Italy again. Now, be a sensible girl; forget all about unfortunate me. No one possibly can know; and when the prince appears, marry him. Be assured that I shall tell no foolish tales.'

Gradually, surely, the blood crept into the girl's face as she listened to these mocking words. She drew herself up inch by inch, her eyes bright and hard, her head thrown back. There was a look of infinite withering scorn

upon her as she spoke, sparing not herself in the ordeal. 'And that is the thing I loved! she said, each word cold and clear—that is the thing to which I gave all my poor heart! I understand your words only too well. I am abandoned. But you have not done with me yet. My turn will come, and then—beware!'

'A truce to your histrionics,' Le Gautier cried, all the tiger aroused in him now, and only too ready to take up the gage thrown down. 'Do you think I have no occupation, nothing to dwell upon but romantic schoolgirls one kills pleasant hours with, in roaming about the world! You knew well enough the thing could not last. I leave for London to-morrow; so, he sensibly, and let us part friends.'

'Friends!' she echoed disdainfully. 'You and I friends! You have made a woman of me. From this moment, I shall only think of you with loathing!'

'Then why think of me at all? It is very hard a man cannot have a little amusement without such a display of hysterical affection as this. For goodness' sake, Genevieve, do he sensible!'

Stung to madness by this cruel taunt, she took one step towards him and stopped, her whole frame thrilling with speechless, consuming rage. It would have gone hard with him then, could she have laid her hand upon a weapon. Then all at once she grew perfectly, rigidly calm. She stepped to the little sanctuary, and took down the wooden cross, holding it in her right hand. 'Before you go, I have a word to say to you,' she said between her clenched white teeth. 'You are a man; I am a poor defenceless girl. You are endowed with all the falseness and deceit that flesh is heir to; I am ignorant of the great world that lies beyond the horizon. You fear no harm from me now; I shall evoke no arm in my defence; but my time will come. When you have nearly accomplished your most cherished schemes, when you have your foot upon the goal of your crowning ambition, when fortune smiles her brightest upon your undertakings—then I shall strike! Not till then shall you see or hear of me; but the hour will come. Beware of it!'

'Perfection!' Le Gautier cried. 'You only want'—

'Not another word!' the girl commanded. 'Now, go!—mean, crawling hound, base deceiver of innocent girls! Go! and never look upon my face again; it shall be the worse for you if you do! Go! and forget my passionate words; but the time will come when they shall come back to you. Go! With steady hand she pointed to the opening in the wood; and without another word he slunk away, feeling, in spite of his jaunty air, a miserable, pitiful coward indeed.

As he turned to go, Genevieve watched him down the long avenue out of sight, and then, sinking on her knees, she sobbed long and bitterly, so full of her grief and care that she was oblivious to her surroundings. Her face was deadly pale, her white lips moved passionately, as she knelt there weeping, half praying, half cursing herself in her despair.

'Genevieve!'

The word, uttered in a tone of wonder and alarm, was repeated a second time before the

agitated girl looked up. Salvarini was standing there, his usually grave face a prey to suspicion and alarm, a look which did not disguise entirely an expression of tenderness and affection. Genevieve rose to her feet and wiped away her tears. It was some moments before she was calm enough to speak to the wondering man at her side.

'I have chosen an unfortunate moment for my mission,' Salvarini mournfully continued; 'I am afraid my presence is unwelcome here.—Genevieve, there is something behind this I do not understand. It must be beyond an ordinary grief to move you like this.'

'There are some sorrows we dare not think of,' Genevieve replied with an air of utter weariness.—'Luigi, do not press me now. Some day, perhaps, I will ask you to help me.'

'I am afraid a brother is the fittest confidant in a case like this. Pardon me, if I am wrong; but when I hear you talking to a man—for his voice came to me—and then I find you in such a plight as this, I must think.—O Genevieve! my only love, my idol and dream since I first saw your face, to have given your heart to some one unworthy of you. What will Carlo say, when he hears of it?'

'But his must not hear,' Genevieve whispered, terrified. 'Luigi, you have surprised me; but you must keep my secret—I implore you.'

'I can refuse no words of yours. But one thing you must, nay, shall do—you must tell me who this man is; you must have an avenger.'

'Luigi,' the girl said, laying her hand gently upon his arm, 'I shall be my own avenger—that I have sworn by the cross I hold in my hand. If it is for years, I can wait—and hope.'

'That is a wrong spirit,' Salvarini replied sorrowfully. 'You are mad just now with your wrongs. Stay here at home, and let me be your champion. I love you too well to admire such sentiments from you yet. I shall not press you now; but all time, for good or for evil, I shall wait for you.'

'Luigi, you are a good man, far too good for me. Listen! I must satisfy my revenge; till then, all must wait. Things alter; men change; but when the time comes, and you are still the same, say "Come to me," and I shall be by your side.'

'I shall never change!' he replied as he touched the outstretched hand with his lips gently.

Slowly and sadly they walked back towards the house—Genevieve calm and collected now; Salvarini, mournfully resigned; pity and rage—pity for the girl, and rage against her deceiver—alternately supreme in his heart. For some time neither spoke.

'Will you come in?' she asked.

'Not now,' he replied, feeling instinctively that his presence would only be an unwelcome restraint. 'I had a message to bring from Carlo. He and Sir Geoffrey and Miss Charteris are coming to-morrow.—And now, remember, if you want a friend, you have one in me.—Good-bye.'

'Good-bye, Luigi,' she said mechanically. 'You are very good. I shall remember.'

Strangers coming to-morrow. The words hear on her brain like the roar of countless hammers. Strangers coming; and how was she to meet them now, with this wild sense of wrong burning within her vengeful Italian heart, bruised

but not crushed? She walked slowly up-stairs and sat down in her room, thinking, till the evening light began to wane, and the lamps of distant Rome to twinkle out one by one. The very silence of the place oppressed her.

'Are you coming down to supper, Genevieve?'

She aroused herself at these words, and looking up, saw a child standing there before her. She was regarding her sister somewhat curiously, and somewhat pitifully too; the latter, child as she was, did not fail to notice the pale face and dark-ringed eyes. She approached the older girl, throwing her arms round her neck and kissing her gently. 'What is the matter, *cara*?' she asked in her soft liquid Italian. 'Have you one of your headaches again, sister? Let me comfort you.'

'I have something more than headache, Lucrece—some pain that no soft words of yours can charm away. Run away down-stairs, child; I am not fit to talk to you now.'

'Please, Genevieve, I would rather stay with you.'

Genevieve looked out again across the landscape, lit here and there now by twinkling lights, reflected from the happy firesides, till it was too dark any longer to see aught but the ghostly shadows.

'Lucrece!' she exclaimed suddenly, 'come here.'

The child hesitated for a moment, and obeyed, taking her sister's cold damp hand in her own, and waiting for her to speak.

'Do you remember, Lucrece, the Golden City I used to tell you about when you were a little one, the blessed place far away, where there is no strife and no care, and every heart can rest?'

'Yes, I remember, sister.'

'And should you care to go with me?'

'O yes, please. I would go anywhere with you and not be afraid.'

'Then you shall go. When you go to your room to-night, do not take off your clothes, but lie awake till I come for you. Only, mind, if you say a word of this, you will not see the beautiful city.'

Through the rest of the hours, Genevieve moved about mechanically, getting through the evening meal she scarcely knew how. Gradually time passed on, one by one the members of the household retired. It was an hour later when Genevieve entered her little sister's room. 'Lucrece, are you awake?' she whispered.

'Yes, sister; I am waiting for you. Are we going now?'

'Yes, we are going now. Walk softly, and hold my hand. Come, let us hasten; we have far to go, and the way is weary.'

Silently they passed down the stairs, and out into the night-air, along the path to Rome, walking on till they were lost in the darkness of the night; Genevieve's face stern and set; the little one's, bright and hopeful.

Gradually the east flushed with the golden splendour of the coming dawn; the birds awoke to welcome up the sun; and after them, the laggard morn. The orb of day saw strange things as he rose in the vault of heaven: he saw two tired wayfarers sleeping on the roadside; and then, later, the anxious faces of a

party gathered at a pretty villa by the Tiber. As he sank to rest again, he went down upon a party searching woods and streams far and near; and as he dipped behind the shoulder of the purple hills that night, his last red glimpse flushed the faces of the stern sad-visaged group on their way to Rome. When he rose again there were no wayfarers by the roadside, but a brother on his knees praying for his lost darlings and strength to aid him in his exremity. In Sol's daily flight he saw hope lost, abandoned in despair; but as came each morn, he brought a gentle healing, but never Genevieve back to the Mattio woods again!

And so time passed on, bringing peace, if not forgetfulness.

(To be continued.)

THE MONTH: SCIENCE AND ARTS.

THE armour-plated ship *Resistance* was lately the subject of some interesting and highly practical experiments at Portsmouth. The ship's armour is four and a half inches in thickness, and this armour was backed up in various places—for the purpose of experiment—with india-rubber and asbestos, in order to see how far these materials might be relied upon as automatic leak-stoppers. A little fleet of gunboats now fired upon the vessel at short range, sending shot after shot completely through the armour, and penetrating the india-rubber backing, which measured an inch and a half in thickness. The armour when protected with an outer jacket of india-rubber fared no better. Much the same results were obtained when the shots were directed to that part of the hull of the vessel which had been provided with a backing of asbestos. The water poured so freely through the shot-holes, that they had to be plugged, to obviate the risk of the vessel sinking. In the sequel, it was unanimously agreed that both india-rubber and asbestos are quite valueless as additions to armour-plating.

Mr Mallet, of the University of Virginia, describes a most unusual phenomenon which occurred in the laboratory of that institution last winter, in the shape of explosive ice. The ice in question formed in the glass vessel of a gaseous—the familiar apparatus for charging water with carbonic acid gas. The expansion of the ice burst the vessel, after which the ice itself exploded repeatedly, and threw off fragments with a crackling sound. The effect is attributed to the pressure of the gas contained in the ice, which in the case of water would appear as simple effervescence.

Steel sleepers for railways, in lieu of the rough wooden ones formerly employed, are now coming into greatly extended use, and there are few railways where they are not being tried either experimentally or adopted permanently. In the underground workings of collieries, the maintenance of wooden sleepers forms an important item of expense, and there is every hope that steel sleepers will take their place. Mr Colquhoun, the general manager of the Tredegar Iron and Coal Company, has invented a form of steel sleeper for this particular purpose. Its sides

are corrugated, and it has two projecting fangs at each end, which clutch the ground upon which it is laid. The complete weight of the sleeper and its fittings is only sixteen and a half pounds. It has been on trial in some of the South Wales collieries, and has given every satisfaction.

The *Lancet* lately called attention to a singular tradition bearing upon infant mortality, which is widely circulated and believed in. An inquest was held upon a child five weeks old which had been found in bed suffocated beside her mother. Death was attributed to a cat getting on the bed and sucking the breath of the child. There seemed to be no evidence against the cat; indeed, the animal did not appear upon the scene. The *Lancet* points out that death was no doubt due to overlaying by the parent, and that 'breath-sucking' is probably a myth, or it would ere now have been proved by observation.

An American inventor, Mr A. Hardt, has patented an arrangement for using very small slack coal as fuel for boiler-firing. The apparatus consists of two fireclay retorts—very much after the pattern of the retorts used in gas factories—which are placed immediately above the ordinary firebox. Each retort has a slide in the bottom, which can be withdrawn so as to empty it of its contents. In addition to this, each has a tube of fireclay reaching from the back part of the retort into the fire beneath. The action of the apparatus is as follows: The retorts are charged with slack, which by the heat of the fire is gradually coked, while the gas evolved from it is carried to the fire beneath. When all the gas has been driven off, the sliding bottom of the retort is withdrawn, and the coke falls into the furnace, to form fresh fuel. Two retorts are employed, so that one can always remain at work while the other is being recharged.

Mr F. Siemens has invented a new method of repairing furnace-linings while at a white-heat, which will be found very useful in steel and glass furnaces where high temperatures are necessarily employed. Under such temperatures, the sides of furnaces become softened, and quartz powder or sand projected against the soft places will readily adhere. Mr Siemens' apparatus for compassing this end consists of a small wagon, upon which are mounted a fan and a movable pipe like a fire-hose, which can be made to direct a blast in any required direction. The nozzle attached to the pipe is introduced into the furnace-doors, and the sand is blown against the particular part of the furnace-lining which may require reparation.

The trieycle is being gradually applied to so many different purposes, that it can no longer be regarded as a means merely of healthy exercise. Traders use it largely for the delivery of small parcels; postmen in country districts depend upon it as a useful steed; the military genius of the Germans is turning it to account for the Littlefield; and in many ways its value is receiving increased recognition. Its last application is in the form of an auxiliary to the fire brigade. The trieycle in question embodies the following parts: It contains a hose reel, with a quantity of hose specially constructed to wind up into a very small compass; a light double-pump fire-engine, capable of throwing twenty-five gallons of water per

minute; a collapsible cistern to hold water; and a simple fire-escape with descending ropes and bag. Two men can run the tricycle at full speed, and the pedal action can afterwards be applied to pumping. The apparatus has been introduced by Mr Glenister, chief of the volunteer fire brigade of Hastings, in conjunction with Mr J. C. Merryweather of London.

The French scientific journal *La Nature* describes and illustrates a machine for making a product which is coming into favour in various different employments under the name of wood-wool. As its name implies, this material is simply wood cut into such fine shavings that it answers many of the purposes to which wool is commonly applied. Although it was at first intended merely as a packing material, it was soon found that it had a much more extended field of usefulness. It is being employed for stuffing mattresses, as bedding for cattle, for the filtration of liquids, &c. It is elastic like horsehair, and is beautifully clean in use. The wood used by preference is Riga fir; and the machine will produce, without any necessity for skilled labour, more than fifteen hundred pounds of 'wool' per day of ten hours.

A cart-wheel without axle, axle-boxes, grease-boxes, and journals, seems to be something akin to an impossibility; but such a thing has been produced and exhibited at the Palace of Industry, Paris, by M. Suc. Its principle is this: Suppose that we have two grooved rails, and that we place one on the ground with its groove uppermost. In this groove we then place a number of steel balls, and above them we place the other rail with its groove downwards. Thus placed, the two grooves are facing one another, while the balls are embraced by both, so that if we push the upper rail, it will slide over the lower one, owing to the simple rotation of the balls. Imagine the two rails to be bent into a circle, with the balls still between them, and we have the principle of M. Suc's axleless wheel. The inner part is fixed to the wagon; and the outer part, consisting merely of a grooved rim, works round it with the balls between. The thing seems to be wonderfully ingenious; but we doubt whether it would work so well as the old-fashioned form of wheel. A dusty road would try its powers to the utmost.

A somewhat elaborate plan for keeping railway foot-warmers hot has been devised by M. Toninasi, a French electrician. He proposes that after the foot-warmers have been charged with their hot solution of acetate of soda—as is commonly done on the French railways, and on some few lines in Britain—the heat should be kept up by electricity. The current to maintain this heat would be obtained from a dynamo driven off an axle of the carriage-wheels, and would be carried to all the foot-warmers throughout the train. We should think that it would be a far easier and less expensive plan to utilise some of the waste heat from the locomotive, which might be applied to the carriages by means of pipes. Has this plan ever been tried?

The cultivation of tobacco in Kent is an experiment which many agriculturists are observing with keen interest. So far, the experiment has been a success, and this in spite of very unfavourable weather, and the presence of unusual quantities of destructive pests in the shape of insects.

We are told that earwigs have done a great amount of damage to the plants, for they have been chewing tobacco ever since the leaves came to maturity. According to the opinion of experts, Kent is the most suitable place in this country for the culture of tobacco. Not only is the soil suited to the growth of the plant, but the same oast houses which are used for drying the hops, and whose conical tops form such a noteworthy feature of the Kentish landscape, can be readily adapted to drying the tobacco leaves. It is thought, indeed, that hops and tobacco might be grown on the same land, and form a combined industry which would pay well.

M. l'Hoste, the French aeronaut who recently crossed the Channel by means of a balloon, made use of a piece of apparatus which seems to represent some advance in the art of aerial travelling. This contrivance was dragged in the water of the Channel from a rope attached to the balloon. By this means the acrostat was kept at a certain height above the water. But it served a further purpose than this. By its means water was drawn up into the car and utilised as ballast. Formerly, ballast once thrown out of the car could not be recovered; but by this invention it can be picked up when the balloon is travelling over water. We may note that Mr Green, one of the most celebrated balloonists, made use of an inverted cone, attached to a rope, when travelling over water. This cone acted as an anchor to the balloon, keeping it at a certain height above the water, and at the same time allowing it to drift along.

A Report was lately read at the French Academy of Medicine referring to an operation which was successfully conducted by the help of a magnet. A patient who was by profession a sword-swallower at fairs, had, while at a restaurant, amused some companions by hiding a steel fork in his throat. By an accident, the fork reached to a lower point than the experimenter had reckoned for, and a surgical operation became imperative. By means of a strong magnet, the fork was moved to a position, where a simple incision soon relieved the sufferer of this unwelcome intruder.

The divers employed on the wreck of the ill-fated *Oregon* have almost finished their labours. Six men have been at work upon the wreck, each man remaining under water for from half an hour to one hour at a time. The cargo of the vessel chiefly consisted of bales of cotton; and the divers were furnished with hooks, like workmen employed in the same business on dry land, with which they could grasp and handle the bales. These were attached to steam pulleys, and hauled on board the wrecking vessel. To get at the mail-room, the aide of the submerged vessel had to be blown in with dynamite, but much of the mail-matter was spoilt by the water before this was done. The divers report that the vessel is fast breaking up; her bow has fallen over into the sand, and she is broken in two between the mainmast and the foremast, although some of her spars are still visible above water.

Dr H. J. Fox announces in the *St Louis Medical Journal* that creosote is almost a certain cure for erysipelas, for he has treated some hundreds of cases with only one fatal result.

The affected parts are kept constantly covered with cloths soaked in a solution of creosote in water—six to twenty drops of creosote to one ounce of water; or a poultice may be formed by stirring ground elm into the solution so as to make a paste.

At the Birmingham Art Gallery, a new method of illuminating the pictures is being tried. In the centre of the room is a suspended ring of ninety-six Swan incandescent lamps, each of twenty candle-power. Within this ring is a series of silvered glass reflectors bent to such a curve as will insure the pictures being well illuminated without any reflection from their surfaces. The arrangement has been devised by Messrs Chamberlain and Hookham.

A Report has recently been published by Mr Verbeck, who was deputed to inquire into the origin and character of the terrible volcanic outburst at Krakatoa, in the Straits of Sunda, two years ago. He calculates that the amount of matter ejected from the volcano was equal to a mass measuring at least ten cubic miles, and that the velocity with which this matter was thrown into the atmosphere was greater than the projecting power of the biggest of big guns. He considers that the ejected matter must have reached a height of thirty miles; that is, about six times the height of the highest mountain in the world. The explosions were heard over a fourteenth part of the earth's surface; and an atmospheric wave travelled from the scene of disturbance, and spread itself over the surface of the globe in thirty-six hours.

We are glad to see that a Society for the Protection of Birds has been instituted in New York. It seems to be akin to the Plumage League recently incorporated in our own country, while its aims are more comprehensive. Its chief object is to protect birds not used for food from destruction for incautious purposes, and it will also endeavour to secure and publish information relative to the present enormous destruction of birds for the purposes of dress, decoration, and general adaptation to fancy articles. It will also point out in its teachings the bad results which must in time accrue to agriculture from the wanton destruction of birds which prey upon insect life. The robbing of birds' nests and the destruction of eggs will also be discouraged by the Society.

Among the papyri which have recently been brought to Vienna from El Fayoum was one which, according to those who have deciphered it, mentioned the existence of a city in Lower Egypt which seems to have completely vanished. The document in question is a papyrus four feet long by one foot wide. It contains a marriage contract between one Theon and his bride Maria, with the signature of witnesses and a notary. All these people are described as belonging to the city of Justinopolis. No mention of this place can be found among any lists of places which exist. The papyrus is supposed to date from the sixth century.

The dispute as to the permanence or non-permanence of water-colour drawings has received a fresh contribution from the pen of Mr E. A. Goodall, whose father engraved a certain drawing of Turner's which is now in the national collection. It had been pointed out, as a proof of

the fugitive nature of the pigments which the great painter employed, that many details which appear in the engraving in question are not now visible in the original drawing. Mr Goodall, however, says that these details never were visible in the painting, it being the custom of Turner, when proofs were submitted to him for approval, to touch up those proofs and to introduce new effects—clouds, figures, &c., which were not in the original work.

Mr W. A. Gibbs, whose name in connection with hay-drying apparatus will be remembered, has lately turned his attention to a machine for 'withering' tea after the leaves have been curled and twisted in the rolling-mill. This is brought about by submitting the damp leaves to a current of dry air, which speedily desiccates the mass. The machine consists of a revolving fan in an iron casing mounted on a pair of wheels, with a small coke-fire in a box in front of it. There is a hand-wheel to drive the fan, and handles attached to the casing, so that the contrivance can readily be moved from place to place. There is an inlet and outlet for the air, the latter passing over the fire. In front of the inlet there is a cage, in which are placed lumps of chloride of calcium, a salt which has the property of absorbing all moisture within its reach, and which when saturated can easily be restored to its former state by heating. It can thus be used over and over again, so that first cost is the only expense. By this apparatus a dry air can be delivered without the employment of any excessive heat, and such conditions give the best results in the desiccation of tea. Mr Gibbs has also devised a machine for the rapid drying of fibrous materials, which will doubtless be found valuable in many branches of trade and manufacture.

A TALE OF TWO KNAVERIES.

IN FOUR CHAPTERS.—CONCLUSION.

UNCLE FRANKLIN drew towards his end. It soon became evident that the grim churchyard experiment which he had suggested would in his case be entirely unnecessary. As he sank lower and lower, and the cruel, icy grasp clutched his labouring heart more often and more fiercely, Lucy found herself almost a fixture at his side. He could hardly bear her absence, however short; and when the fits of palpitation were upon him, he seemed to hold on to life by her hand alone. He would talk to her when he was able—talk of business, nothing but business and money, always money, until the gold seemed to jingle in her brain as though it were the inside of a tumbler. It was very trying and wearing; but tenderness of heart and compassion for this unloved and desolate old money-worshipper, whose idol had failed him at his need, this spoiler whom a hand more ruthless than his own was spoiling, kept her staunch to her post. She thought little of her expectations, and that only for her husband's sake; in the presence of this aimless, endless money-babble from the lips of a suffering and dying man, the idea of her possible and probable inheritance had grown almost distasteful to her; and Uncle Franklin had not as yet broached the subject of his will.

There came, however, a day when, with the last words he ever spoke, he for the first time broke his silence in this respect. The doctor had paid his daily visit, and had gone away with that shake of the head and significant look which tells that human skill has done its utmost. The patient was lying in a half-dozed, and Lucy was sitting by the bedside, when he suddenly opened his eyes and fixed them full upon her. 'It's nearly over, my girl,' he said. 'You have done your duty by me, and I thank you. You'll find I have kept my promise. When the time comes, send to my solicitor, Blackford of Southampton Buildings—he'll know what to do.' He closed his eyes after speaking these words, and seemed to sleep again. That night he died, quietly and without a struggle. It was in the third week after the making of the second will.

Those were days of anxious reflection for Mr Blackford. Business was more than commonly 'slack' with him, so that he was able to give his undivided attention to his little scheme. Even Willoughby had failed to renew his visits, a circumstance which almost escaped the lawyer's notice, so preoccupied was he with things of greater moment.

What course should he now adopt? How should he best use his advantage? Nobody save himself knew of the hiding-place, or even of the existence of the later will, unless the testator should have altered his mind. Somehow or other, he must manage to substitute the earlier will for the later. But how? There appeared to be but one way in which to do what must be done; it was a way which demanded courage, self-possession, and unflinching nerve; for a moment's faltering or bungling would in all probability bring about a shameful and disastrous failure. That way Mr Blackford determined to take; and so waited as patiently as he might for the news of Mr Franklin's death and the expected summons to the house.

Both came together; the latter in a form which he did not expect, and which discomposed him a good deal—in the form, namely, of an invitation to the funeral. Lucy said in her letter that Mr Franklin had stated that his solicitor would know how to act with reference to his affairs; and that both she and her husband felt that it would be more seemly to defer any such action until the dead man had been laid in his grave. But on reflection, Mr Blackford was less dissatisfied than at first with this arrangement. It was a delicate and difficult operation which he had to perform; possibly it might be carried out with greater ease in the confusion and excitement of a crowd, than under the undistracted scrutiny of only two pairs of eyes. All that he had to do was to slightly amend his plan of action to suit the altered circumstances. He replied to the letter with graceful condolence, asking that, in pursuance of the testator's wishes as communicated to himself, all the family might be summoned to hear the will read after the funeral.

This was done accordingly; and when the company had returned from the ceremony, Mr Blackford found himself in the presence of a tolerably numerous and not too good-tempered assemblage, in Tom Wedlake's dining-room. By this general invitation, vanished hopes had been

revived, almost forgotten jealousies and suspicions had blossomed anew; and in every face, repressed truculence and ready defiance were thinly varnished over with the expression proper to the occasion. The general hostility brought itself to a focus upon Tom and Lucy, who were treated by all but the latter's own parents with severely guarded affection.

The solicitor rose from his chair and addressed the expectant relatives with decorous gravity. He had carefully weighed and rehearsed every word which was to be spoken, for he had to pass through an ordeal which would test his coolness and readiness to the utmost. It was necessary in the first place to clear his way—to make sure that there was no unsuspected information in the possession of any present which might upset all his calculations in a moment.

'It is now my duty,' said he, 'to read the will of the late Mr Franklin. But may I first ask, whether any one here happens to be aware of the intentions of the deceased with regard to the disposition of his property?'

There was no reply. All eyes were turned significantly and mistrustfully upon Tom and Lucy; but neither felt inclined to speak the word which should let loose upon them the pent-up storm.

'Mr and Mrs Wedlake,' said the solicitor—and a preparatory tremor of indignation ran through the listening group—'were, as we know, in closer communication of late with their uncle than any other members of his family; perhaps they would be able to tell us something?'

Tom answered by a shake of the head, which might signify either refusal or unwillingness. But there was an air of composure about him and his wife which was in marked contrast with the flushed expectancy generally prevalent, and which was calculated to give rise to exasperating surmises.

Mr Blackford proceeded: 'I regret this very much, for it renders my task all the more difficult and unpleasant. But that I cannot help. It is by no fault or interposition of my own that things are—as they will presently appear. Neither is it for me to question the testator's wisdom or his right to do as he pleased with his own. I can only say that I used all my powers of persuasion to divert Mr Franklin from his purpose, but unavailingly; therefore, I could only act as I was instructed.'

Curiosity was excited by these words to the highest pitch; it was evident that they portended some disaster, and an angry buzz began to make itself heard.

'The first thing to be done,' continued the solicitor, 'is to produce Mr Franklin's will. It is in his bedroom; and, with the permission of Mr and Mrs Wedlake, I will now go and fetch it.'

The words were hardly out of his mouth when, with a brisk and business-like step, he left the room, and was half-way up the stairs before any one had the presence of mind to follow him. As he went, he drew a paper from his breast-pocket and carried it cautiously just within his coat. He was in the room scarcely a quarter of a minute before Tom and Lucy, followed by the whole of the company, came hurrying after him; but those precious seconds served his purpose. They found

him looking up at the shelf of books in the recess, rather pale, a little out of breath, but entirely self-possessed. The master of the house was about to comment sharply on his strange behaviour; but the solicitor gave him no time.

'The will,' said he, 'is in one of the largest of these books; but upon my word I don't exactly remember which. Cruden's *Concordance*—yes, I think it must have been Cruden's *Concordance*. I think I should prefer, under all the circumstances, that some one else should make the search.—Mr Wedlake, perhaps, would oblige us by trying Cruden's *Concordance*?'

Tom took down the big book, held it by its covers, and shook it vigorously, producing no other result than a shower of dust.

'Dear me!' said Mr Blackford, 'it is very strange.—Will you try the next book, Mr Wedlake? It is a Prayer-book, I think.'

The same process was repeated; this time a folded paper fell to the floor. The solicitor picked it up.

'We are right this time,' he answered, reading the indorsement. 'Will of William Franklin, Esquire.—And now, I think, we may go downstairs again.'

The excited crowd, angrily expectant of they knew not what, rustled and fluttered down the stairs once more, and settled on the dining-room chairs like a flight of crows. Standing at the table, Mr Blackford opened and read the will with dignified deliberation, but with a slight tremor in his voice, and an almost imperceptible catching of the breath which he could not control, and which were perhaps excusable under the circumstances.

It is not easy to describe the scene which followed. Deceit was thrown to the winds; poor human nature stood out in startling nudity from under the conventional trappings of woe. There was a perfect storm of ejaculations and threats; the women cried, the men raved; one reverend gentleman of hitherto unapproachable behaviour actually shook his fist in Mr Blackford's face.

'It is a fraud, a forgery!' cried Dr Franklin, a younger brother of the deceased. 'William would never have made such a will. He might have left his money to some public body, rather than to his own flesh and blood; but to a lawyer—never!'

Meanwhile, Tom Wedlake, who, having consistently expected nothing, was the less disappointed, and therefore able to keep his head, had taken the document in his own hands and carefully inspected the signature. He now raised his voice above the general hubbub.

'Gentlemen, gentlemen! I think we are rather forgetting what we have been doing to-day. If you have no respect for the dead, perhaps you will be good enough to show a little for my wife's dining-room.'

These words, sharply spoken, produced a sudden lull, of which Tom took advantage.

'One thing is certain—this is no forgery. Most of you know Mr William Franklin's writing better than I do. Look for yourselves. It is a perfectly genuine signature.'

A dozen necks were instantly craned over the paper. There was nothing to be said. Every one had to confess that Tom was right; but

the fact only added fuel to the family wrath, as rendering their chances all the more desperate.

Tom continued: 'My wife's uncle has lived with us, as you know, for some months past, and my wife has taken care of him and nursed him in his last illness. He was grateful, or seemed so; and he promised to provide for her. He repeated his promise in the last words he ever spoke.'

'I suppose, sir, that you will consequently consider yourself entitled to contest the will?' fiercely interrupted the angry clergyman.

'One moment, if you please. I shall do nothing of the kind; neither will my wife, with my consent. Mr Franklin had a right to do as he chose with his money; and I must say I never put any faith in his promises. This gentleman is welcome to what he has got, if he can arrange with his conscience—which I dare say he can. How and why he has got it, I don't profess to understand; but I shall certainly not endanger my peace of mind by trying to take it from him.'

Mr Blackford had felt himself a little overborne by the general animosity; but he did not want for spirit, and now spoke up coolly and defiantly. 'If anybody thinks fit to waste his time and money in trying to upset this will, he is quite welcome. I shall defend my rights.—And my conscience is quite easy, thank you, Mr Wedlake.' Mr Blackford, having fired his shot, took himself off with his prize.

Tom had to devote the rest of the day to consoling his wife, who was fairly broken down by the revelation of Uncle Franklin's cruel duplicity.

'I can't think he would have done it, Tom,' she said. 'I really believe he did get to like me at last; and what object could he have had in behaving in such a wicked way? I am quite certain that that Mr Blackford has cheated us, somehow. Did you notice how his voice shook, and how pale he was? and what made him run up-stairs as he did, without waiting for our leave?'

Tom was silent for a few seconds. 'There is a great deal about the whole business that is strange and unaccountable,' said he—'a great deal that I can't understand—and I don't mean to try, Lucy dear. We needn't break our hearts about Uncle Franklin's money. We love one another—we are young and strong—let us put all this away from us like a bad dream, and settle down once more in the old happy way.'

Meanwhile, Mr Blackford was walking fast and far through London streets in a perfect delirium of self-gratulation, unshadowed by one thought of remorse or any dread of retribution. All was safely over; everything had fallen out well for him and his wicked scheme. The prize was fairly in his clutches at last, apparently beyond the power of any man to wrest it from him. The will by which he benefited was no clumsy forgery; it bore the testator's genuine signature; it had been executed in the presence of disinterested witnesses, and, for all those witnesses could say, on the very date which it purported to bear.

No wonder that Mr Blackford exulted in the impregnability of his position, and indulged in castle-building to a considerable extent. He could not bring himself to return at present to

his dull and dingy office, gloomy with the recollections of failure and poverty. In a very short time he would leave it for ever; he would continue his career in more cheerful quarters and under very different conditions. A professional man with plenty of money has no need to run after patients or clients; they, on the contrary, will run after him. His fortune should double and treble itself in his careful hands; municipal distinctions should be his; some day, perhaps, a seat in parliament. He would make a good marriage; he would shake hands with lords—most fascinating of dreams to him as a professed Radical—his working hours should be spent in easy and pleasant labour, and his leisure in carefully regulated dissipation. And so he strode through the lighted streets, intoxicating himself with the pleasures of imagination.

Another man, at the same time, was prowling about London streets, not through the broad and blazing main thoroughfares, but by gloomy byways, half lit by the feeble glimmer of thinly scattered lamps, where only an occasional footstep sounded upon the flags—a man who shrank from the presence of his kind, whom he insanely imagined were all leagued in a cruel and inexplicable conspiracy against his reputation and his life—a man accompanied wherever he went by mocking persecutors, who dinned into his ears, themselves unseemly, furious denunciations, hideous blasphemies, fiendish jests; daring him to face them, and eluding his every effort to do so; threatening him continually with exposure and punishment for impossible crimes; taunting him with the universal enmity of mankind. And one name formed the ever-recurring burden of this diabolical chant—the name of the man in whom he had trusted, and who had betrayed him to his foes; the name of the man who was in their secrets, and was helping them to bring their victim to ruin; who had taken his money for pretended aid, only to join his persecutors in laughing at his misery.

The unhappy wretch stood still and listened, like a hare to the yelping of the pack. Presently he turned and went away, no longer with the uneven and desperate gait which had caused several passers-by to look curiously after him, but with the rapid and determined step of a man who had a thing to do and was on his way to do it.

Mr Blackford dined sumptuously in a well-known restaurant. Afterwards, he thought, he would go to his office, there in secrecy and safety to put the finishing stroke to his fortunes by destroying, carefully and completely, the second will. He had not cared to do this anywhere else; something might be seen and suspected; a bird of the air might carry the matter. Where so much was at stake, it was not worth while to leave anything to chance. When he had dined, he sat awhile and smoked his cigar with the air and sensations of a millionaire; while his visions of the future grew yet more roscate under the influence of a bottle of old Tokay. At last he took his hat and coat and departed.

The outer door of the house in which his offices were situated was closed; all the other

occupants, with the exception of the old housekeeper, had long since gone home. He knocked and rang.

'Law! Mr Blackford, sir, I couldn't think who it could be at this time o' night,' said the woman, as she peered into his face by the light of her flaring and guttering candle. 'Are you goin' to your rooms? I'm afraid the fire's ont, some time. Shall I light it up again, sir?'

'No, thank you, Mrs Smith,' returned the solicitor. 'I shall not be very long; I have a few letters to write, that's all. Give me two or three matches to light the gas; I shall want nothing else.'

'There's been a gentleman here for you, about half an hour ago, sir,' said Mrs Smith, as she lighted him up the stairs. 'He seemed disappointed that you were gone; but I told him you wouldn't be back to-night, and he went away.'

'I should think he might have known that this was no time to find a man at his office. What sort of gentleman was he?' inquired Mr Blackford carelessly.

'Well, sir, I really couldn't say; the wind blowed out my candle as I opened the door,' said Mrs Smith. 'He was a tallish gentleman, I think; but I didn't notice no more than that.'

'Ah—well, I daresay I shall know him when I see him. I suppose he will call to-morrow.' And the solicitor entered his office and closed the door. He opened it again almost directly.

'Mrs Smith, what has become of the key?' he called sharply.

'Mr Jobson took it away with him, sir, to get a new one made. The lock is that stiff, he twisted the handle off the key trying to turn it, and he had a job to get it out again.'

Mr Blackford seemed much annoyed. 'Very careless of him. The lock has always gone well enough before. However, it can't be helped.—Mind, you don't come up here to disturb me, do you hear? My letters are important, and I want to be very quiet while I write them.'

'I'll take care, sir,' answered the housekeeper humbly; and the door closed once more.

The old woman set down her candle and put her head out into the street. A sudden desire had come over her to solace her loneliness with the luxury of a bloater for supper. There was a dried-fish shop just round the corner. She could get there and back in a minute, and she would leave the door on the latch, to save herself the trouble of fetching her key. No harm could come to the house in that time; so she set off at a shuffling run along the pavement.

A tall figure came from the shadow of the opposite houses into the middle of the road. It paused and looked up for a moment at the now lighted windows of the solicitor's office; then it advanced to the door, cautiously pushed it open, and disappeared within.

The housekeeper returned almost immediately. She did not notice that the door was a little wider ajar than she had left it; had she done so, the same high wind which had already extinguished her candle once that evening would have sufficiently accounted for the fact. Taking her light, she vanished into the subterranean

region where she lived, whence presently arose the savoury odour of the toasting bloater.

Mr Blackford, on entering his inner room, sat down at his table. He left the door slightly open behind him, in order that he might hear any footstep on the landing, any attempt to enter the outer office. Taking both the wills from his pocket, he spread them before him. Again a wild feeling of exultation surged through his brain and made his pulses bound; he could not resist the pleasure of reading through the document so unavailingly designed to rob him of his hopes, before he put it for ever beyond the power of mischief. After that, he read the will which was in his favour; then he fell once more into a delicious reverie. There was no reason for hurry; he was quite alone and in safety.

He was so absorbed that he did not hear the outer door open with a caution which might well have escaped greater watchfulness. Neither did he hear the catlike step which crossed the floor of the clerks' office, nor the tiny creak as his own door was pushed open. After this, the silence was deathlike; it was only accentuated by the slight hiss of the burning gas over his head.

Mrs Smith had long finished her bloater, and sat yawning by the dying fire in the nether regions, wondering how long it would be before 'her gentleman' took his departure, so that she might lock up and go to bed. Once already she had heard, as she thought, a footstep on the stairs, and the street door quietly closed; so sure had she been of this, that she had gone up to the first floor to see that all was right. But Mr Blackford's gas was still burning; and through the outer and inner doors, both of which, a little to her surprise, were open, she could see the figure of the solicitor seated in his chair with his back towards her, bending low and intently over his desk; so she had concluded that her old cars had deceived her, and mindful of Mr Blackford's warning, had stolen back to the basement. That was nearly two hours ago, and her patience was becoming exhausted.

At last she thought that he must either have fallen asleep over his writing, or that he had left without her hearing him; so she once more went up-stairs.

He was sitting just as she had last seen him; but this time she thought that there was something strange about his unaltered posture. He must certainly be asleep. She walked gingerly into the outer office, and spoke to him—no answer. She spoke louder—still silence. Then she went up to the motionless figure and touched it on the shoulder. The next instant, she jumped back with a ringing shriek, stumbled out on to the landing, and got herself down the stairs and into the street with an agility which would have done credit to a younger and lighter woman; and in fifteen minutes the house was in the occupation of the police.

Mr Blackford had fallen forward on his desk, the papers on which were spattered with his blood. The top and back of his head were smashed in by blows from some heavy blunt instrument. He had been horribly murdered; and before dawn the murderer was in the hands of the police—a raving maniac, flourishing the blood-incrusted life-preserver with which he had done the deed, and boasting of having

silenced for ever the most dangerous of all his foes. It was ascertained that his name was Charles Willoughby; and from the papers found at his lodgings, it was easy to communicate with his friends. He is now in a lunatic asylum, hopelessly incurable, and his property is in the hands of trustees.

Both wills were found on the dead man's table; and before many hours were over, Tom and Lucy Wedlake were informed of the interposition which had taken place in their favour. When the first shock at the terrible nature of that interposition was over, Lucy could not help triumphing a little over her husband at the complete fulfilment of her prophecy, and Uncle Franklin's execration from the suspicion of ingratitude and treachery. Tom was beyond measure astonished, and confessed to his wife's superior acumen.

They lost no time in putting themselves in competent professional hands; and the will which constituted Lucy sole legatee was established without much difficulty. There was a little trouble at first with the dead man's relations; but they were fairly respectable people, and when the hopelessness of their case was made apparent to them, they withdrew their opposition to the document which bore the clear impress of the testator's real intentions.

Tom Wedlake has purchased a partnership in a flourishing commercial house, and is now richer than Uncle Franklin ever was, and a far greater object of respect to his own and his wife's families. Towards them, however, he by no means enacts the old gentleman's ill-conditioned part, being open-handed and generous to the last degree; and he is at this moment the head of as happy a household as can be found within the four-mile radius or outside it, a fact which he prizes far beyond all his wealth.

OCCASIONAL NOTES.

THE HESSIAN FLY.

THE following suggestions have been prepared by Mr Charles Whitehead, F.L.S., F.G.S., at the request of the Lords of the Committee of Council for Agriculture, for the information of agriculturists:

The Hessian fly is terribly destructive to corn crops in the United States, Canada, and parts of Germany. In some years it has almost entirely destroyed the wheat crops in large districts in these countries. In the upper counties of Georgia Packard States 'the fly has committed such ravages upon the wheat as scarcely to leave enough seed for another year.' It had not been found in Great Britain until this present year, though in 1800 fears were entertained that it had been introduced. In 1788 the importation of wheat from America was prohibited by the British government until it was ascertained that it was not likely that the insect could be brought over in this way. Now, however, without any doubt it has appeared here, and all effort must be made, and at once made, to stamp out this dangerous intruder. To effect this, if possible, information is given below as to the nature of the attack of the Hessian fly, and a

description of it in its various stages, as well as methods of preventing it from spreading in this country.

The plants of wheat and barley infested with this insect turn yellow, and become stunted and unhealthy. Plants upon sharp gravelly patches, 'pinnocky places,' 'stone-brash,' or 'stone-shatter,' and upon the poorest parts of fields, show the attack first and most seriously. As the plants ripen, the straw becomes root-fallen and scrawled, the ears are small, and the grains misshapen and shrivelled. Corn-plants thus affected should be carefully examined, especially their leaves or blades, just at the points where they cover the second points of the stems from the ground. Upon corn-plants thus injured, either the larvæ of the Hessian fly or its pupæ will be found close to the lower joints between the stems and the leaves or blades. The larvæ, which are the authors of the mischief, as they suck out the juices of the plants, are clear, white, or translucent maggots about the fifteenth of an inch long, having stripes of a greenish hue under their skins. They remain in this state from four to six weeks, and then assume the pupal or semi-pupal form. The pupæ are called 'flax-seeds' in America, because they are like small elongated flax-seeds. They are a little longer than the larvæ, and are of a chestnut colour. It is in this state alone that the Hessian fly has been seen in England. These pupæ are unmistakable, and when once discovered, immediate steps should be taken to prevent them from transforming into flies, which would lay eggs upon the corn-plants either in the coming autumn or in the spring.

Crops of wheat and barley in whose straw the 'flax-seeds' have been found should be cut above the second joint, either by setting the reaping-machines high, or by reaping them by hand, so as to leave a long stubble. Where barley is short and must be cut with scythes, the mowers should be instructed to keep them as high as possible. Land upon which the crops have been infested should be cultivated or broad-shared immediately after harvest. The stubble and rubbish should be collected most carefully and burnt; after this the land should be deeply ploughed, or the stubble might be ploughed in at once deeply. Straw from infested fields should be closely inspected when thrashed. If pupæ are found, the straw should be used on the spot if possible for litter, and all passed through 'mixens,' that beat may destroy them. The chaff and 'cavings' from such straw should be burnt, and the corn screened in the most careful manner. Corn from infested fields should on no account be used for seed. Where manure is obtained from the cow-sheds and stables of London and other cities and towns, it should be 'mixed' for some time, as it is very probable that the pupæ of the insect might be imported in packing-cases and with straw crates from America and Canada. Wheat-plants and barley-plants that show yellowness and other signs of disorder in the autumn or spring should be closely examined for larvæ or pupæ of the Hessian fly. Should it be discovered that the larvæ or maggots are injuring young wheat-plants in November, or that pupæ 'flax-seed'—are present upon these, it would be well to feed them down hard with sheep.

THEORIES OF DEW.

Referring to our recent article on 'A New Theory of Dew' (No. 126), a correspondent at Beaumaris writes as follows:

'You will see from the following experiment, one of many carried out by Mr Du Fay in Paris towards the end of last century, that Mr Aitken's ideas regarding the origin of dew are not strikingly new, and only go to prove the old adage that "There is nothing new under the sun."—"Mr Du Fay, at Paris, placed two ladders against one another, meeting at their upper ends, and spreading wide asunder below. Their height was thirty-two feet. To the several steps of these he fastened large panes of glass, so disposed as not to overshadow one another. With this apparatus exposed to the air, he found that the lower surface of the lowest pane of glass was first wetted with dew, then its upper surface, then the lower surface of the pane next above it was wetted, and so on, until all the panes to the very top of the ladders became covered with dew. Mr Du Fay maintained that this was an unanswerable proof that dew was formed from vapours ascending from the earth during the night, rather than from the descent of such as had been raised in the course of the day." Dr Wells's theory is doubtless the more generally accepted; but many men, more especially such as have sojourned in tropical climes, hold to Du Fay's opinion, namely, that the moisture causing dew emanates more from the soil than from the circumambient air.'

SOLITUDE.

Not in the deepest tangles of the wood,
The turtle's haunt, the timid squirrel's lair;
Not on the ocean benches, rough and bare
With never-ending battles, unsubsided
In war of winds and waters hoar and rude;
Not in the mountain-passes, where the air
Sobs low, and life is like a long despair—
Thy home is not in these, O Solitude!
But in the busy concourse, long and loud,
Where not one pulse of human sympathy
Beats through the grasping spirits of the crowd—
Where each is rapt in snatching greedily
His brother's portion—neath a shallow shroud,
We know thy truest haunt, and weep for thee.

ARTHUR L. SALMON.

The Conductor of CHAMBERS'S JOURNAL begs to direct the attention of CONTRIBUTORS to the following notice:

- 1st. All communications should be addressed to the Editor, 339 High Street, Edinburgh.
 - 2d. For its return in case of ineligibility, postage-stamps should accompany every manuscript.
 - 3d. To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, should have the writer's Name and Address written upon them IN FULL.
 - 4th. Offerings of Verse should invariably be accompanied by a stamped and directed envelope.
- If the above rules are complied with, the Editor will do his best to insure the safe return of ineligible papers.

TRUTH IN THE MARVELLOUS.

ANTIQUARIAN research, conducted in the prosaic spirit of the present day, has dealt cruel blows at many time-honoured traditions. We are taught that the story of the siege of Troy was a mere romance—that Troy itself never existed; that Arthur's Round Table was a myth; that the accidental appearance of a Countess's garter at a ball was not responsible for the institution of the highest order of knighthood; that a certain other Countess never freed the citizens of Coventry by riding through their streets with innocence for her only dress; that the Maid of Orleans was never burned, but married, and lived happy ever afterwards. We hardly know what historic relation we are to be allowed to believe. While, however, historical inquiry has discredited many pleasant stories, hard science has come to the aid of romance, and has testified to the veracity of some narrators who have been accused of imposing on the credulity of the ignorant and superstitious by the relation of wonders unworthy of credence in enlightened times. The stories of the appearance in the heavens of blazing sceptres, fiery serpents, and swords of fire dipped in blood, when read in the light of the calm and unbiased observations of some meteors in recent times, are descriptions of physical phenomena sufficiently rare to be accounted supernatural by nations whose acquaintance with the heavenly bodies did not extend beyond the regular movements of the sun, moon, and planets. There is no doubt that the authors of these accounts related truthfully what they saw, employing the language which best conveyed their impressions.

With what awe the visit of a meteorite may be regarded, even in this nineteenth century, by unlearned country-folk, may be gathered from the account of one which fell at Juvenas, in Ardèche, on the 15th of June 1821, and which formed the subject of a curious *procès verbal* drawn up by the mayor of the commune. It was first seen at three P.M. as a fireball, in a

clear sky, while the sun was shining brightly; and it sunk five feet into the ground. The inhabitants were so alarmed, that it was more than a week before they could make up their minds to search for this strange visitant. 'They deliberated for a long time whether they should go armed to undertake this operation, which appeared so dangerous; but Claude Serre, the sexton, justly observed that if it was the Evil One, neither powder nor arms would prevail against him—that holy-water would be more effectual; and that he would undertake to make the evil spirit fly;' after which reassuring speech, they set to work and dug up the aerolite, which weighed over two hundred pounds.

We read in the classic poets that on certain momentous occasions, statues have been so affected as to perspire, as if they were living human beings. These stories have been passed over as mere poetic fictions; but probably they rest on a substantial foundation. The phenomenon is doubtless that which is observed when a fire has been lighted for the first time in a room which has for a lengthened period been allowed to remain cold: the walls and other objects are seen to run down with moisture, which appears as if exuded from their surface. The same thing occurs when a long-continued frost is succeeded by mild weather. The appearance is familiar enough to us, who are accustomed to sudden variations of temperature; but in warmer and more equable climates, the requisite conditions are probably rare; and the appearance of copious moisture on statues composed of substances* on which dew is not commonly found, may well have been accounted a prodigy.

We may not be disposed to admit that the fiery cross seen by Constantine was a miraculous intimation; but we cannot set aside the account as necessarily apocryphal; for a celestial cross was seen in Migné, near Poitiers, in December 1826. It was observed during a religious service, and the preacher in his sermon had referred to the cross of Constantine. The awe-struck

congregation, on perceiving the visible cross in the sky, of shining silver, edged with red, immediately fell upon their knees, accepting the sign as a divine testimony to the truth of what had just been told them. The source of the phenomenon was afterwards found in a wooden cross which had been erected near the chapel, the shadow of which had been cast by the declining sun on a rising mist.

The Flying Dutchman was obviously another instance of atmospheric reflection, and similar phantom ships have been described by modern travellers. The Enchanted Island, or Isle of Ghosts, which had its place in old charts in the mid-Atlantic, and so perplexed the mariners of the middle ages by its varying appearance, defying all attempts to reach its shores, has since been recognised as a fogbank.

Among the wonders recorded in the reign of William Rufus, it is said that on a night in 1095, the stars seemed falling like a shower of rain from heaven to earth, or, according to the Chronicle of Reims, were driven like dust before the wind. A tradition is recorded as prevailing in Thessaly that on a certain night in August the heavens were opened and burning torches were seen through the aperture. These are clearly but highly coloured accounts, by persons of limited knowledge of natural phenomena, of specially brilliant displays of shooting-stars. The last corresponds with the August meteors.

Bartholin, in his *History of Anatomy*, speaks of a patrician lady of Verona, Catherine, wife of J. Franciscus Rambaldus, whose skin sparkled with fire when slightly touched. 'This noble lady,' he says, 'the Creator endued with so stupendous a dignity and prerogative of nature, that as oft as her body was but lightly touched with linen, sparks flew out plentifully from her limbs, apparent to her domestic servants, as if they had been struck out of a flint, accompanied also with a noise that was to be heard by all. Oftentimes, when she rubbed her hands upon the sleeve of her smock that contained the sparks within it, she observed a flame with a tailed ray running about, as fired exhalations are wont to do. . . . This fire was not to be seen but in the dark or in the night, nor did it burn without itself, though combustible matter was applied to it.' This description of electric sparks is such as would be given by a person who saw the phenomenon for the first time and was ignorant of its cause. The same appearance is sometimes seen by persons of the present generation when 'divesting themselves of tight-fitting underclothing, and especially when combing their hair with a vulcanite comb; but probably it shows itself only with persons of peculiar constitution.

It is hardly necessary to advert to the part which comets have played in the annals of supernatural manifestations. In classic times, however low the state of knowledge may have been in other departments of physical science, the celestial bodies were never without intelligent observers, and the ancient astronomers no doubt acknowledged comets as having their place in the planetary or sidereal economy. But this knowledge was confined to the learned; to the common people, comets were chariots of fire conveying departed heroes to the abode of

demigods. A splendid comet luckily appeared after the death of Julius Cæsar, and confirmed his title to divine honours. In the dark ages, comets were celestial portents, presages of revolution or pestilence. Throughout the sixteenth and seventeenth centuries, it was accounted profane scepticism to attribute their appearance to natural causes; and even as late as the beginning of the eighteenth century, we find an intelligent writer on the natural curiosities of the world adopting the view that these bodies are not allowed to appear except with the special permission of Divine providence, for a specific purpose, in opposition to the theories of astronomers, who are twitted with assigning long periods to the orbits of comets in order that the predictions of their reappearance may not be falsified in the lifetime of the persons making them.

Whether it was owing to the improved means of spreading intelligence afforded by the invention of printing, or to the excitement of men's minds consequent upon the political and social events of the time, the sixteenth century was prolific in stories of wonderful sights in the heavens and on the earth. Of the many marvellous accounts then circulated, we select the following, which forms the subject of a tract by Abraham Fleming, and purports to have been taken from the evidence of eye-witnesses. The account is titled, 'A Strange and Terrible Wunder wrought very late in the Parish Church of Bungay—namely, the fourth of this August in the yeere of Our Lord 1577 . . . with the appearance of an horrible shaped thing sensibly perceived of the people then and there assembled.' The account is couched in terms appropriate to the solemnity of a special manifestation from the spiritual world, and is interspersed with ejaculations expressive of the awe which filled the people's minds at their witnessing the occurrences described; but the incidents, briefly told, are as follows: A storm of extraordinary fury was raging while the congregation were assembled at divine service; rain came down like a deluge, lightning flashed, and thunder pealed, so that not only dumb creatures were disquieted, but 'senseless things void of all life and feeling shook and trembled;' in other words, the fabric and furniture of the building were shaken by the violence of the storm. While the tempest was at its height, a visitor from the lower regions (as the narrator evidently believed) made his appearance in the midst of the congregation, in the form, 'as they might discern it,' of a dog, of a black colour; 'the sight whereof, together with the fearful flashes of fire which then were scene, moved such admiration in the mindes of the assemblie that they thought doomes day was already come.' The 'Evil One in such a likeness' ran with extraordinary speed down the body of the church among the people. Passing between two persons who were on their knees apparently engaged in prayer, he wrung the necks of both of them in an instant, so that they died where they knelt. As he passed by another man he 'gave him such a gripe on the back that therewithal he was presently drawn together and shrunk up as it were a piece of leather scorched in a hot fire; or as the mouth of a purse or bag drawn together with a string.' This man,

however, did not die. Meanwhile, the parish clerk, who was cleaning out the gutter of the church, also saw the 'horrible shaped thing,' and was struck to the ground with a violent clap of thunder, but beyond his fall, was not harmed. The stones of the church and the church door, on being afterwards examined, bore evidence of the power of the demon in the marks of his claws or talons; and all the wires, the wheels, and other things belonging to the clock, were wringing in sundor and broken in pieces.

A similar occurrence is stated to have been witnessed the same day at Blibery, a village seven miles from Bungay. In this case, the demon planted himself upon the roof-loft, from which he flung himself down into the church, and after killing two men and a lad, and burning the hand of another person, flew out of the church 'in a hideous likeness.'

Refuso dismissing this story as a fable, bred of the imagination of people terror-stricken by the storm, let us compare it with the account of an occurrence which took place on Malvern Hills on the 1st of July 1826. A party had taken refuge in an iron-roofed hut from an impending storm, and were about to partake of refreshment when the storm came on. A gentleman who was standing at the eastern entrance—the storm had come from the west—saw what seemed to him to be a ball of fire moving along the surface of the ground. It came up and entered the hut, forcing him, as it did so, several paces forward from the doorway. An explosion followed, described by the inhabitants of the village at the foot of the hill (Great Malvern) as terrific. On going in, as soon as he had recovered from the shock, to look after his sisters, he found them on the floor, fainting, as he thought, from terror. Two of them had died instantly; and a third lady, with others of the party, were injured. An examination of the hut showed a large crack in the side opposite to that at which the fireball had entered, leading up to a window, and the iron roof above this was indented.

The correspondence of the leading circumstances of this account with Fleming's story is remarkable; and had the Malvern incident occurred in the superstitious sixteenth century instead of the scientific nineteenth, it would no doubt have been regarded as a supernatural visitation, and have furnished just such a marvellous story as that of Bungay. In both cases, something was seen to enter a building during a thunderstorm, killing two persons instantly and injuring others, disappearing with a noise described in the one case as a violent clap of thunder, and in the other as a terrific explosion, and leaving behind visible marks of its progress in the material of the building. In each instance, too, a person stationed outside saw something which drove him from his place, but otherwise did not harm him; and in both cases the body, whatever it was, which seemed to be the immediate source of the mischief had a progressive motion, which, though swift, could be followed by the eye. The chief point of difference is in the appearance presented by the vehicle of the destructive agent. In the one case it is likened to a black dog, and in the other to a ball of fire, and it may be said that no two things could be more unlike. As to the form

of the so-called dog, little need be said. It is admitted that the church at the time was in such a state of 'palpable darkness' that one person could not perceive another; and in the dark, any ill-defined object that can be perceived at all has a tendency to assume a fantastic shape. It was accompanied by 'fearful flashes of fire,' which seem to be distinguished from the lightning, and the effect on those who were touched by it was that of scorching or burning. Whether the vehicle which brought the destructive force into the church, and which was thought to be a fiend, was a mass of highly charged smoke or dust, or a miniature cloud of the kind which, on a grand scale, passed over Malta on the 28th of October 1757, the effects described correspond so entirely with those known to result from a particular kind of thunderstroke, that we cannot accuse the author of writing otherwise than in good faith. The supernatural colouring may fairly be ascribed to want of knowledge in regard to a subject which, even now, is but imperfectly understood. The Malta storm-cloud, which destroyed nearly two hundred lives, and laid in ruins almost everything in its way, is described by Brydone as being at first black, afterwards changing its colour till it became like a flame of fire mixed with black smoke; but he reports that despite the scientific explanations of this extraordinary storm-cloud, the people declared with one voice that it was a legion of demons let loose to punish them for their sins. There were, says he, a thousand people in Malta that were ready to take their oath that they saw the fiends within the cloud, 'all as black as pitch, and breathing out fire and brimstone.'

Besides those mentioned above, many other strange stories might be instanced which, at the time, were accepted as true accounts of supernatural appearances; and afterwards, when the general belief in spiritual manifestations declined, were denounced as false, because contrary to nature, but have since been recognised as consistent with natural laws. By taking into account the surrounding circumstances, the state of knowledge at the time, the customary modes of expression, &c., we may, from many stories at first sight incredible, arrive at a substratum of truth which may form a valuable addition to the sum of human knowledge. Imbued with a sense of their own superior wisdom, learned men, and others who have thought themselves learned, have sometimes rashly pronounced as impossible, and therefore untrue, phenomena which have since been accepted as facts. In Arago's *Popular Astronomy* is an account of a meteorite which struck the earth at Lucé, in the year 1769. It was perceived in the sky by several persons, who watched its progress until it reached the surface of the earth, when it was at once picked up and preserved; but the Academy of Sciences pronounced it impossible for a solid body to have fallen from the heavens. On the 24th of July 1790, a quantity of these stones fell at St Juliar—in the fields, on the roofs of the houses, and in the streets of the village. The fall was preceded by what is described as the passing of a great fire, after which was heard in the air a very loud and extraordinary noise. The facts were certified by the

municipality of the place and by some hundreds of the inhabitants; but the affair was treated in the public journals as a ridiculous tale, calculated to excite the compassion not merely of savants, but of all reasonable persons.

Modern scientific research, while continually giving us fresh revelations of that order in nature which is its enpreme law, is at the same time constantly narrowing the domain of the impossible. Even the wild dreams of the alchemist appear, to the chemist and physicist of to-day, less groundless than they did eighty or a hundred years ago. The present century, the age of the railway, the electric light, the telegraph and telephone, is certainly not less replete with marvels than any of its predecessors. Many of the achievements of applied science, to which we have now become habituated, if they could have been related to a person living in the middle ages, would make as great demands upon his credulity as the most wonderful stories of past times do upon ours, and problems which have baffled the genius of all past ages, and the insolubility of which had come to be regarded as a matter of faith, have been solved in our own time. And yet we have no ground for assuming that we have approached a limit in the field of discovery, or for claiming finality in our interpretations of nature. We have lifted a corner of the curtain, and are enabled to peep at some of the machinery by which her operations are effected, but much more remains concealed, and we know not what marvels may yet in course of time be made clear to us. There are doubtless more things in heaven and earth than are dreamt of—even in our philosophy.

BY ORDER OF THE LEAGUE.

BY FRED. M. WHITE.

IN TWENTY CHAPTERS.—CHAP. IV.

FIVE years have passed away, bringing strange changes and startling revolutions—years, to some, fraught with misery and regret; years, to others, which have been pregnant with fame and honour; but to the suffering, patient world, only another step nearer to eternity. Five years later, and night in the small German town where honour is wrecked and lives are lost on the hazard of a die. The Kursaal at Homburg sparkling with the glitter of ten thousand lights. Men of all nations were gathered there, drawn together by the strongest cords which bind human destiny—the power of gold. No type of face was wanting; no passion, no emotion that the human visage is capable of, but had its being there: rage, despair, misery, exultation—the whole gamut of man's passions and triumphs. Women were there too. The bluest-blood recorded in the *Almanach de Gotha* did not disdain to rub elbows with the last fancy from the Comédie Française; my lord, cold, indifferent, and smiling, sat side by side with the reckless plunger who would have bartered his honour, had that commodity remained to him, for the gold to place upon the colour. On the long green tables, the glittering coins fell with a subdued chink sweeter than the

finest music to the hungry ears; a republic the most perfect in the universe, where rich and poor alike are welcomed, with one great destiny—to lose or to gain. There were no wild lamentations there; such vulgar exhibitions were out of place, though feeling cannot be disguised under the deepest mask, for a tremor of the eyelid, a flash of the eye, a convulsive movement of the fingers, betray poor human nature. As the game proceeded with the monotonous cry of the croupier, it was awful to watch the intentness of the faces, how they deepened in interest as the game was made, bending forward till at length 'Rouge perd et couleur' came from the level voice again.

The croupiers raked in the glittering stacks of gold, silently, swiftly, but with as much emotion as a child would gather cowslips, and threw the winning on each stake as calmly, knowing full well that in the flight of time it must return. The piles were raked up, and then arose a murmur, a confusion of tongues, reminding the spectator of what the bewilderment at Babel must have been, a clamour which died away to silence at the thrilling 'Faites votre jeu.'

Now the hands clawed at the sparkling treasure; eager, trembling avarice in every fingertip; from the long, lean, yellow claw of the old withered gamester, to the plump little hand of the bride, who is trying her fortune with silver, fearful lest, driven by despair, some less fortunate player should lay felonious fingers upon the piled-up treasure.

Standing behind the all-absorbed group was a young man with pale, almost ghostly features, and a heavy dark moustache. From his attitude and smile, it was hard to say how fortune had served him, for his face was void of any emotion. He held one piece of gold in his hand, placed it on a colour, waited, and lost. A trifling movement of his lips, pressed tightly together under the dark moustache—that was all. Then for a moment he hesitated, pondered, and suddenly, as if to settle the matter quickly, he detached a coin from his watchchain and leaned forward again. Under him, seated at the table, was a woman winning steadily. A pile of gold was before her; she was evidently in the luckiest vein. The man, with all a gambler's superstition, placed the coin in her hand. 'Stake for me,' he whispered; 'you have the luck.'

Mechanically, she took the proffered coin, and turned it in her hand; then suddenly a wave of crimson, succeeded by a deathly whiteness, came across her face. She held the coin, then put it carefully aside, and staked another in its place. Then, apparently forgetting her emotion in the all-absorbing interest of the game, she looked at the table. 'Rouge gagne, et couleur perd,' came the chant of the croupier. The stakes were raked in, and the money lost. Under his breath, the man uttered a fervent imprecation, slightly shrugged his shoulders, and turned to watch the game again. From that moment the woman lost; her pile dwindled away to one coin beyond the piece of metal tendered her to stake,

but still she played on, the man behind watching her play intently. A little varying luck, at one moment a handful of napoleons, at another, reduced to one, the game proceeded. At length the last but one was gone, save the piece tendered to her by the man behind the chair; that she never parted with. As she sat there, words came to her ears vaguely—the voice of the man behind her, and every time he spoke she shivered, as if cold breath were passing through her heart. A temporary run of luck came to her aid, and so she sat, listening and playing.

The new-comer was another man, evidently an Italian, fine, strong, with an open face and dark passionate eyes. He touched the first man upon the shoulder lightly, speaking in excellent English.

There were four actors there, playing, had they but known it, a ghastly tragedy. The two men were players; the listening woman was another; and across the table, behind the spectators, stood a girl. She had a dark southern face of great beauty—a face cleanly chiselled, and lighted by a pair of wondrous black eyes—eyes bent upon the two men and the woman, playing now with the keenest interest. She shrank back a little as the new-comer entered, and her breath came a little quicker; but there she stayed, watching and waiting for some opportunity. Her look boded ill for some one. Meanwhile, the unconscious actors fixed their attention on the game. The last arrival touched the other man upon the elbow again, a little roughly this time.

‘You have been playing again, Hector?’ he said.

‘I have been playing my friend—yes. It is not in my nature to be in such a place without. What would you have me do, Luigi? I am dying of ennui from this inaction—kicking up my heels here waiting for orders.’

‘I should have thought you could have found something better to occupy your time,’ the man addressed as Luigi returned. ‘Our work is too stern, too holy, to be shared with such frivolity as this. Gold, gold, with no thoughts of anything but this maddening scramble!’

‘My dear Luigi, pray, control yourself. Are you not aware that this sort of thing has been done to death? Do not, as you love me, descend to the level of the descriptive journalist, who comes over here to coin his superlative condemnatory adjectives into money—to lose at this very interesting game. John Bull holds up his hands in horror as he reads the description in his *Telegraph*, and then he comes to try his luck himself. I, Hector le Gantier, have seen a bishop here.’

‘How fond you are of the sound of your own voice,’ Luigi Salvarini returned. ‘Come outside; I have something important to say to you.’

‘Something connected with the League, I suppose,’ Le Gantier yawned. ‘If it was not yourself I was talking to, I should say, confusion to the League.’

‘How rash you are!’ Salvarini returned in a low tone, accompanied by an admiring glance at his companion. ‘Consider what one word spoken lightly might mean to you. The attendants here, the croupier even, might be a Number in the League.’

‘Very likely,’ Le Gantier replied carelessly; ‘but it is not probable that, if I should whisper the magic words in his ear, he would give me credit for a few napoleons. I am in no mood for business to-night, Luigi; and if you are the good fellow I take you for, you will lend me—’

‘One Brother must always aid another according to his means, says the decree. But, alas! I have nothing.—I came to you with the intention?’

‘Oh, did you?’ Le Gantier asked sardonically. ‘Then, in that case, I must look elsewhere; a few francs is all my available capital.’

‘Hector,’ the Italian exclaimed suddenly, in a hoarse whisper, ‘where is the?’—He did not finish his sentence, but pointed to the watchchain the other was idly twirling in his fingers.

Le Gantier smiled sarcastically. ‘It is gone,’ he said lightly—‘gone to swell the bloated coffers of the bank. Fortune, alas! had no favour even for that mystic coin. Sacred as it should have been, I am its proud possessor no more.’

‘You are mad, utterly mad!’ Salvarini exclaimed. ‘If it were but known—if it has fallen into the hands of the bank, or a croupier happens to have a Number, think of what it means to you! The coin would be forwarded to the Central Council; the signs would be called in; yours missing!’

‘And one of these admirable German daggers would make acquaintance with my estimable person, with no consolation but the fact of knowing what a handsome corpse I shall make. Bah! A man can only die once, and so long as they do not make me the posthumous hero of a horrible tragedy, I do not care. It is not so very serious, my Luigi.’

‘It is serious; you know it is,’ Luigi retorted. ‘No Brother of the League would have had the sublime audacity, the reckless courage!’

‘Laudace, l’audace, toujours l’audace,’ Le Gantier returned. ‘I sigh for new temptations; the sight of the gaming-table is to me what the smell of battle afar off is to the war-horse. I came here intending to risk a louis; I have lost everything. There is nothing like courage at the tables; and as it had a spice of danger in it, I risked!’

‘Your life! You do not seem to comprehend the danger.’

‘But, my dear friend, it is exactly that spice of danger that gives the thing its nameless charm. Come, you are ripped, out of sorts. You see the duties of the Order in every action; you see the uplifting of the avenging dagger in every shadow that trembles on the wall. Be a man!’

‘I am all the more disturbed,’ Salvarini observed with moody, uneasy face, ‘that the orders have come. That is the principal reason I am here to look for you. We are translated to London.’

‘That is good news, at any rate,’ Le Gantier exclaimed briskly. ‘I have been literally dying to get back there. By the bright eyes of Enid—What is that?’

Above the clamour of tongues and the rattle of the gold pieces, a low laugh was heard distinctly close to the speaker’s elbow. He turned sharply round; but there was no one within a

few feet of them. Apparently, it had not disturbed the intralled players, though the croupier swept his cold eye around to discover the author of this unseemly mirth.

'Strange!' Le Gautier observed. 'I seem to have heard that laugh before, though I cannot remember where.'

'And so have I,' Salvarini whispered hoarsely—'only once, and I hope that I may never hear it again. It is horrible!'

Le Gautier looked at his companion, amazed to see the agitation pictured on his face. It was white and drawn, as if with some inward pain. Salvarini wiped his damp brow as he met the other's piercing gaze, and tried to still the trembling of his limbs.

'A passing fancy,' he explained—'a fancy which called up a remembrance of my boyhood, the recollection of a vengeance as yet unpaid.—But I am idling; let us get outside. The orders have come, as I tell you, for London. We are to meet the Head Centre at the old address.'

'And how did the orders come?' Le Gautier asked.

'The old mysterious way,' was the impatient reply; 'secrecy and darkness; no trust in any one, however worthy he may have proved—the old suspicion, which drags us down, and holds our hands even in the act of striking. I found them on my table when I got in. You and I are to get to London, and there await orders. Our instructions bear the crossed daggers, indicating extreme secrecy and a mission of great danger.'

In spite of his *sang froid*, Le Gautier could not repress a slight start; and a smile of covert sarcasm, pity almost, rose to his lips as he looked in his companion's eager, enthusiastic face; the same sort of pity the sharper feels for his unconscious victim when he has him within the toils. Not that the younger man noticed this; his eyes were full of some far-away project, something noble, by their expression.

'The old story of the monkey and the chest-nuts,' Le Gautier observed with his most sinister smile; 'the puppets run the risk, and the Head Centres get the glory. If we fall, it is in freedom's name. That is sufficient epitaph for us poor, silly, fluttering moths.'

'But the glory of it!' Salvarini cried—'think of that!'

'The glory, yes—the glory of a felon's grave! The glory lies in the uncertainty. What do we gain, you and I, by the removal of crowned heads? When the last tyrant fell at our leader's dictate, how much did we benefit by the blow? He was not a bad man; for a king, he was just.'

'You are in a bitter mood, to-night, Hector,' Salvarini answered. 'What will you say when I tell you the appointment has come with your nomination as a Deputy, with a seat at the Council of the Crimson Nine?'

'My appointment at last! You are joking, Luigi. Surely they had need of better men than I. What of Le Fontaine?'

'Dead,' Salvarini responded grimly. 'Treachery was suspected, and it was necessary to remove him.—But what I tell you is true; you are ordered to be present at the next Council at Warsaw, two months hence, when you will give

up your badge as an Avenger, and take the premier order.'

'And I have staked it to-night on the hazard of a die!' Le Gautier exclaimed, pallid over beyond his usual deathly whiteness. 'Fool, fool that I was! How can I prevent it becoming known? I am undone!'

'You do not know the worst,' Salvarini replied. 'Come closer, and let me whisper in your ears; even the walls carry such tidings. The Supreme Director is here!'

Le Gautier turned faint and sick as he looked furtively round the room, with its long mirrors and barbaric splendour.

'Suppose you lend me yours?' he suggested. 'You will not want it now. What a mad fool I have been! I wonder if there is any way of recovering it? for I must have it, come what will. With a penalty of?—'

'Death!'

The word, abruptly, sternly uttered, was followed by the same low mocking laugh they had heard before. They looked around in alarm, but no trace of any one could be seen. Standing in the recess of a window, they looked out; but no sign of the mysterious warning, so strangely given.

'Let us get away from this,' Le Gautier groaned. 'I am stifled! Come outside into the open air. My nerves must be unstrung to-night.'

They walked out through the high folding-doors, and disappeared in the darkness. As they left, the woman who had been playing rose from her seat and followed them. Apparently, she was too late, for they had vanished; and with a sigh, she abandoned her evident intention, turning into the Kursal gardens and throwing herself into a seat. Directly she quitted the saloon, the woman with the dark eyes followed, and tracked the other to the quiet retreat. For some time she stood behind the shadow of a tree, watching her. It was a brilliant moonlight night—clear, calm, and peaceful. Without there, the lighted windows of the gambling saloon could be seen; and ever and anon the murmur of the croupier, the scrape of the rakes, and the subdued clink of the gold, might be heard. But the figure on the seat did not heed these things; she was looking at a coin in her hand, making out as she best could the devices that it bore, strange and puzzling to her.

It was merely a gold coin, in fine a moldere of Portugal; and upon the reverse side, the figure had been rubbed down, and an emblem engraved in its place. There was a figure of Liberty gazing at a rising sun, her foot upon a prostrate dead body, and underneath the words, 'I strike.' Over the rising sun, in tiny letters, was the device, 'In Freedom's name'; and at the top, two letters in a monogram. The seated figure noted these things, but, from the expression on her face, they represented nothing to her. Behind the shadow of the tree, the watcher crept closer and closer, trying in vain to get a glimpse of the golden coin. As the seated figure bent over it, tears began to gather in her eyes, overflowing at last, and the passion of sorrow seemed to rise, till her frame was shaken with the sobs she did not strive to master. The woman looking on stepped out from her shelter and crossed the open grass

to the other's side. Her face, on the contrary, was eager, almost hopeful, as she bent forward and touched the weeper on the shoulder. She looked up, surprise mastering her grief for a brief moment.

ARMY PANICS:

BY ONE WHO HAS BEEN IN THEM.

FEW men have gone through a campaign of any duration without having experienced some one or more of those strange incidents of warfare which are known under the name of Panics. Those who have been in them know but too well their peculiarity—how a sudden access of fear seizing upon a body of troops, and communicating itself from man to man with a rapidity that can only be compared to a conflagration in a city built of wood, spreads so quickly that it is impossible to detect its cause, and the coolest observer cannot tell whence the contagion had its origin. Amongst raw levies or young and inexperienced soldiery, such panics are naturally more frequent than amongst tried troops; but history tells us that even the oldest veterans are not proof against their attack.

Napier, in his *Peninsular War*, devotes but some eight or nine lines to an account of the most remarkable recorded incident of this nature, in which Robert Crauford's celebrated Light Division—consisting of those three distinguished regiments, the 43d, the 52d, and the 95th—were seized and put to flight by an attack of fear so sudden and careless that the historian makes no attempt whatever to ascribe a reason for it. 'The Light Division,' he writes, 'encamped in a pine-wood, where happened one of those extraordinary panic attributed in ancient times to the influence of a god. No enemy was near, no alarm given, when suddenly the troops, as if seized with a frenzy, started from sleep and disappeared in every direction; nor was there any possibility of allaying this strange terror, until some persons called out that the enemy's cavalry were amongst them, when the soldiers mechanically ran together, and the illusion was dissipated.' It seems odd that so diffuse a writer should have seen fit to say so little of so extraordinary an occurrence, more especially when we remember that this same Light Division was the flower of the British army in the Peninsula, and that he writes of it not many pages before as 'composed of three regiments singularly fitted for difficult service. Long and carefully disciplined by Sir John Moore, they came to the field with such a knowledge of arms, that six years of warfare could not detect a flaw in their system, nor were they ever overmatched in courage and skill.'

The public has been made acquainted with a goodly number of panics during the last few years, the military annals of which have been so replete with the warlike operations of the British arms. Many of us have thrown up our hands and sighed over the decadence of the pristine virtue of our soldiers, or prophesied darkly the downfall of the whole British race. The reason why the world nowadays is more familiar with

many of the shortcomings and failings of our troops is not very difficult to find. As, before Agamemnon, lived many brave men whose virtues have not been handed down, so too, perhaps, many little indiscretions on the part of the soldiers of Marlborough and Wellington have passed into oblivion through want of a 'special war correspondent.' In spite of press censorship on the part of military officers, sooner or later these lynx-eyed gentlemen, being in the midst of the fighting-men, have seen and recorded in the columns of the daily press very many incidents, the seriousness of which has not been lessened in the telling. Amongst soldiers themselves, a natural pride would make them reticent in such matters; and *l'esprit de corps* has probably caused more than we know of to be buried in the bosoms of the members of some particular corps.

This reminds us of an unrecorded case of 'panic' pure and simple, which was communicated to us, years after its occurrence, by an officer in the regiment concerned. When he spoke of it, he did so with the air of a man fearful of breaking a sacred trust, which even then he seemed to feel hardly justified in betraying, though the regiment had changed its title, and scarcely one of the members in it at the time still remained. Sufficed it to say that the regiment was a distinguished infantry one, composed almost entirely of veterans, who had added lustre to their former glories by the courage and bravery with which they had behaved throughout the trying times of the Indian Mutiny. It was shortly after this terrible outbreak had been quelled that the regiment in question was marching from the scene of some of the bloodiest outrages to a new station in a comparatively undisturbed portion of India. Then, as now, marches in that country were usually carried out at night, the sun in the hot season rendering exposure to its influence more or less unsafe to Europeans. They had almost reached the spot where they were to halt for the night—which, by-the-by, was an exceptionally dark one—in fact, the advance-party had already arrived, when suddenly some sort of commotion and press of men from the rear was noticed by the officers. Before they could divine the cause, the confusion increased, and the regiment, without paying any heed to the commands of the officers, broke its ranks, and fled precipitately into the jungle on either side of the road. As usual, the officers, and even the senior non-commissioned officers, had not shared the general terror, and some few of the privates had at first called upon their comrades to remain steady—hnt all to no avail. They were regularly broken, and scarcely a man remained. Very soon, an explanation was forthcoming. A number of loose horses came galloping down the road. It was the noise of their hoofs over the hard ground, breaking the stillness of the Indian night, that had mysteriously magnified itself into a vague but all-mastering terror. How complete the panic was may be imagined from the fact that many of the men had fled so far into the jungle that they did not return till the following morning. Every inquiry was made by the colonel into the case; but no one was ever made responsible as the originator; and the regiment mutually agreed to keep the whole affair a profound

secret. So well did they do so, that it never leaked out till years afterwards, when time had blunted the sting of publicity.

In South Africa, the disaster of Isandhlwana gave the soldiers' nerves a severe shaking, and it often happened that false alarms at night led to the rousing of whole camps, and sometimes even to a reckless discharge of firearms. In some cases, 'friendly' natives or even comrades were taken by the excited imagination of a sentry for enemies; in others, unoffending cattle, even a bush or a shrub, became the innocent cause of a fusillade sufficient to have dealt widespread destruction to a host of Zulus.

An odd incident, illustrative of the slightness of the cause—or even, perhaps, of the absence of any cause at all—that gives rise to a panic, occurred on the night of Tel-el-Kebir, amidst a small corner of the force that was bivouacking on the battlefield. The narrator had crawled into a marquee in which, with other commissariat stores, were the rum casks from which the troops had received their liquor ration after the fatigues and excitement of the day's fight and previous night-march. Besides one or two commissariat issuers in charge of the stores, several 'odds and ends' of other corps had found their way into the marquee, preferring to rest under its shelter amidst the casks and biscuit-hoxes, than under the open sky with the sand for a bed. Suddenly, in the middle of the night when all were sleeping, a noise and commotion began in the bivouac outside. Before the inhabitants of the tent were sufficiently awake to understand its cause, the curtains were thrust aside by a red-coated soldier, who shouted to us to get up: 'The Arabs are in the camp—they are upon us!' Then he disappeared as rapidly as he had come. Every one sprang to his arms, and probably experienced that especially uncomfortable sensation that is caused by a vague feeling of an unseen though imminent danger against which one is ignorant how to guard. Outside, every one around was aroused and up, eagerly striving to discover from what quarter attack was to be expected. Nothing, however, more unpleasant occurred than the advent of a staff-officer asking the cause of the confusion. Probably the truth never did reach headquarters. Afterwards, however, a report gained ground—no other or better reason was ever forthcoming—that the alarm arose from the screams of a sleeping soldier, who, overwrought perhaps by the horrors of the day, had been fighting his battle over again in his dreams!

It is perhaps as well that all cases of panic should be brought forward and investigated. Hashing them up may be satisfactory to those who feel that the credit and reputation of their particular regiment or corps are at stake; but, like all undeclared and secret evils, they are best dealt with by being dragged to light. How else can the soldier learn their absurdity—how else learn to recognise them and reason on the moment whether he be in the presence of a causeless panic or a real danger?

One lesson certainly the few lines of Napier quoted above teach us. The cry of some one that the enemy's cavalry were amongst them caused the Light Division to rally—it was the dissipa-

tion of a vague terror by the substitution for it of a substantial danger.

Enough has been said to show that panics will occur. It is easy to see how fatal may be their results, and how detrimental they are to the morale of an army. A recognition of this fact must convince us of the necessity that exists for neglecting no step that may tend to minimise their occurrence, or, if they must occur, to meet efficaciously and speedily counteract their effects. Long since, sailors learnt by experience that real or imagined outbreaks of fire on shipboard were too apt to cause panic and confusion, and thereby increase tenfold the horrors of the situation. To provide against this, the fire-alarm is frequently sounded, with a view to accustoming the crew to take up rapidly their allotted posts, when fire actually does occur, with the calmness and despatch bred of familiarity. This system of accustoming men to sudden alarms of attack was practised with success in the Marine Camp round Suakin, and they probably owed the idea in some measure to their naval training. At any rate, their camp was particularly free from needless night-alarms, and their sentries earned the somewhat rare distinction of never having been forced throughout the whole campaign.

GEORGE HANNAY'S LOVE AFFAIR.

CHAPTER I.—TOO LATE!

THERE was a sharp but not unpleasant smell of frost in the air; the small shrubbery around the way-side station of Lochenbreck was covered with a slight coating of hoar-frost, which was being gradually dissipated by the golden rays of the sun, now two or three degrees above the horizon. The bustle of the Twelfth had passed. The 'knowing ones' who prefer Wigtownshire moors to those of the West and North Highlands, as being lower rented and yielding quite as good sport, had come and gone, for it was now the latter end of September. It was about eight o'clock A.M.; the South train was due, and it was timed to stop here for five minutes; not so much on account of any passenger or goods traffic it might deposit or receive, as to allow the iron horse to take a huge drink, sufficient to carry it in comfort to Stranraer. That this particular morning, however, there was some passenger traffic expected was evident. Outside the station stood a wagonette, a pony-cart, and a smart ostler in charge of both; inside was the station-master, a porter, and a young lady. The two former were listening for the clang of the signal-bell announcing the train; the latter, in prosaic truth, was endeavouring to keep her feet warm, by pacing rapidly up and down the limited platform. She was a very pretty girl, with a clear, pinky freshness of complexion, a finely chiselled nose, and a small, sweet, though firm mouth.

The signal-bell clanged, and the train came grandly sweeping in. There was but one passenger, but that was the one the young lady was

waiting for. When he alighted, she ran forward and gave him her hand, which he shook heartily.

'Alone?' she cried.

'Yes, Nan, alone this time! You're not sorry, are you?'

'Oh, no, no! I'll have you all to myself! And you'll have such lots of new London stories to tell, and none of your awfully clever city friends to laugh at me.'

The new arrival's portmanteau, fishing-rods, &c., were put in the pony-cart, and assisting the young girl into the wagonette, he took the reins and started at a smart trot towards Locheneck Inn, some eight miles away over the purple moor.

While they are enjoying the heather-scented air, and the delightful moorland scenery, from which the sun had now dispelled the early morning's mist, it may be as well that the reader should know who the occupants of the wagonette were. *Place aux dames*; Anne Porteous, aged nineteen, was the daughter of Robert Porteous, innkeeper at Locheneck. Robert, however, was not an ordinary innkeeper. He certainly took in guests for bed and board, and, as was said by some, charged very highly for the accommodation; but beyond this, he was proprietor of a loch, and most of the moor encircling it, and could thus give free angling and shooting privileges to his guests. He was quite independent of innkeeping as a means of living; but his father and grandfather before him had kept the inn, and why should not he? Early in life he was left a widower, and Anne was his only daughter. She received an excellent education at S— Academy, and really took charge of the inn business, for her father was crippled with rheumatism. Her management, however, was an unseen one, for she did not come personally in contact with the guests. But there were exceptions to that rule. One of them was her present companion, George Hannay, the editor of the London magazine, the *Olympic*. But then the case with him was different from that of an ordinary guest. Her father and he were old friends, and he had been coming about the place since she was a girl in short frocks. The editor was a very keen angler, and as the sport could best be pursued off a boat, when Anne grew older and strong enough, it was her whim and pleasure to row him about while he wielded the rod. Thus they grew great friends; and his autumn visit was looked forward to with joyous expectancy by little Nan. Little, she was not now; years had glided away, and she had almost emerged into womanhood; but still the old friendly relations were kept up between the two. Last summer she had spent with her father's sister, who kept a *pension* in Brussels, and it is about her experiences there that the pair are chatting gaily as the vehicle rolls homewards over the leaf-bestrewn road.

As for the editor, he was a tallish, well-developed man, with dark hair, whiskers, and moustache considerably more than sprinkled with gray. At first sight you would guess his age at about fifty. But having regard to his light springy step and genial smile, you might have set him down at about forty, and still have been wrong, for in

truth he was only thirty-eight. It was a grand relief for him to leave the Metropolis and his editorial worries behind once a year, and spend a glorious autumn holiday at Locheneck—fishing, talking with his old friend Robert, and—well—yes! (of late years, that is to say) enjoying a chat with his pretty little daughter. It was not accidentally that he came alone this time. Usually he brought a roistering squad of literary bohemians, who made the ceiling of the private parlour ring with jest and song till unseemly hours of the morning. And the reason was, he came prepared to offer his heart and hand to the fair Nan! He did not imagine for a moment he was in love with her. Oh, no! he was too old and sedate for such nonsense as that. In his professional capacity he had dissected and analysed so many excruciatingly sentimental love tales, that he imagined himself Cupid-proof. But things had driven his thoughts towards matrimony. He had got tired of his lady-housekeeper, with her Cockneyfied vulgar airs. Now, if he could only get rid of her, he thought, pension her off, or get another situation for her, and place this Scotch girl at the head of his table, how much brighter life would seem to him! Would she take him? Well, he thought she would. Of one thing he was certain, she was really fond of him; there was no rival in the way; and the father was certain to favour the match. He did not care for girlish gush; sound lasting affection, and purity and singleness of mind, were what he wanted.

The wagonette had now arrived at the inn—a quaint old crows-stepped edifice, half covered with ivy, and surrounded by a garden-wall. Old Mr Porteous was at the door, and bade his guest a hearty welcome. Then Anne set to work, and in less than half an hour there was a tempting breakfast smoking on the private parlour table, which Mr Hannay did excellent justice to. To keep him company, his host and hostess sat at table with him, and made believe to partake of the dainties before them; while the truth was, they had had a hearty breakfast three hours before. The sun, which till now had brightened up the room, became overcast, and a few drops from a passing shower rattled against the diamond-paned window. Mr Hannay rose from his chair and looked out. A splendid day for fishing. 'Come, Nan, my lass,' he said, 'let's to work. It's a shame to sit here idling, with the loch in such fine trim for troutin'.'

'Well, sir, I suppose I must obey orders,' she rejoined, and tripping up-stairs, soon returned arrayed in an old frock, and a head-piece of stiff white calico, resembling in design a sou'wester, and suited to protect from sun, rain, or wind. Half an hour later they were floating on the loch; Nan slowly paddling along, her companion industriously whipping the water; both keeping up a desultory conversation. Her experiences at Brussels naturally formed the chief topic. On this subject she spoke with enthusiasm. She had never seen Paris, therefore its miniature presentment impressed her all the more vividly. Hannay was pleased to hear scenes described with her fresh girlish fervour, to which he had long been blasé.

Apart from the warm feelings he had towards her, her conversation had a literary charm for him, for she was a horn narrator. She took him with her in all her rambles and escapades, and her six months' residence in the gay little capital seemed exposed to his mental vision as clearly as if he had been her companion. Yet the shy little damsel forgot, quite innocently of course, to tell him of sundry moonlight walks with a certain Scotch student, under the laden trees of the Boulevard des Allées.

The fishing was progressing but slowly. Perhaps there was thunder in the air; or possibly the angler's mind was abstracted, and he was thinking of matters of weightier import, than the capture of a few silvery trout. After missing excellent 'offers' on two or three occasions, his companion burst into a merry laugh, and asked him if his wits had gone a wool-gathering, 'I am afraid,' she continued, gravely shaking her head, 'that you are still in love with that wicked Mademoiselle Sylvestre.'

Now, the lady referred to was an aged ex-prima donna of the English opera, and a warm friend of his. It pleased Nan, however, to make-believe that their relationship to each other was of a strongly amorous nature, and she missed no opportunity of teasing him about her. Now was a chance to broach the matter he had at heart. For, strange to say, this experienced man of literature and society, this ornament of London drawing-rooms, felt oddly embarrassed in his new relationship of suitor to a simple country girl. True it was, she had no idea of the terrible designs he had on her heart and liberty; but that seemed only to make the matter worse in his eyes. There was not an atom of self-consciousness about her. Her clear gray eyes were crystalline; he fancied he could read every thought of her soul in their transparent depths. No thoughts of love there evidently. It looked almost brutal to disturb their sweet maidenly repose—almost like shooting a trusting, tame rabbit. If there had been but the least spice of coquetry about her, it would have been so much easier for him to have unburdened himself of his heart's secret—at least so he thought. He never felt so morally limp in all his life, and it was with the courage of despair that he wound up his reel and determined to know his fate then and there. A few intermittent drops of rain began to fall, and seating himself beside her on the thwart, he shared his water-proof with her. He never yet had spoken, save in the language of rallery; how on earth was he now to address her in accents of love and sentiment? However, it must be done; and he took 'a header.'

'My dear Nan,' he began, 'it is really too bad of you to mention that estimable old lady. I like her very much, as I am sure would you if you knew her. But she might easily be my mother! Ah, Nan,' he continued, slipping his arm round her waist underneath the water-proof—'ah, Nan, there is only one girl in all the world I care a pin for, and it is your own sweet self! Nan—will you be my wife?'

As he spoke the last few words, Nan's face grew deadly pale; then the traitor blood rushed back to her cheeks tumultuously, flushing them carmine.

'Oh, no, no!' she piteously cried as she shrunk from him, and gently disengaged his arm from round her waist; 'oh, no! Mr Hannay, that can never, never be! O how stupid and foolish I've been. Forgive me, forgive me, my dearest of friends! But—but—indeed I never looked on you in any way like that. I have been very imprudent—I have been far too free with you—but it was all thoughtlessness. Tell me you don't for a moment believe I was so wicked as to have done it purposely.'

She put her hands over her face, and sobbed aloud. Here was a nice position for a lover to be in, who an hour ago was confidently dreaming of years of sweet companionship with her who now told him in language not to be misunderstood that such could never, never be. These were not the simulated tears and sobs of a heartless coquette; the honest simple girl had evidently never dreamed of the possibility of him being a wooer. He was too old—that was it. And what a fool he had made of himself! Well, he would just require to swallow it all, and comfort himself with the reflection that no one knew of his folly, for he knew *she* would never tell. His heart went out in pity to her. He told her never to mind. He even went the length of pretending that he was almost glad she had refused him, for he was so wedded to city life, with its clubs, greenrooms, and what not, that he was certain he would have been a very careless, inattentive husband, and she a neglected, heart-broken wife. In such wise did he comfort the girl, who dried her eyes and tried to look quite gay and cheerful. There was no more fishing; they rowed slowly back to the hotel. Nan insisted on taking the oars; her rejected lover sat musing at the stern. Suddenly he raised his head, and said with a sedate smile: 'Some one else, eh, Nan?'

His question was not very intelligibly put; but she understood well enough what he meant. Drooping eyelids, a face slightly averted, and a faint blush for answer. After a pause, 'Papa does not know—at least not yet,' she timidly said; 'you'll not tell him?'

'Oh, of course not!' he answered, and biting the end of a fresh cigar, began smoking vigorously. A few minutes, and they were at the Inn jetty, and to old Mr Porteous' extreme astonishment, without a fin to show for their three hours' work.

Dinner past, father and daughter and guest adjourned to the private parlour. Anno retired early under the plea of headache. Host and guest continued to enjoy a cheerful glass and gossip all to themselves.

'By-the-bye, Mr Porteous,' said the latter as he was lighting his candle preparatory to going up-stairs to bed, 'I forgot to say my stay this time will be but a brief one. I am expecting every day to have a letter from a friend at Lucerne who wants me to join him in the fishing there. He says the sport is excellent, and I promised to go if he found such to be the case. Good-night!'

The landlord was astonished, but was too well bred to press him to stay. The truth is, our friend had been far more seriously 'hit' by simple Nan than he had supposed, or was even yet inclined to admit. Try as he would, sleep

refused to come to his tired brain; mocking visions of 'what might have been' flitted through his waking dreams; and he arose in the morning more tired than when he went to bed. The post brought him two letters; one of them, he said, required his instant presence in London on an important matter of business; after that, he would go to Switzerland to join his friend in the fishing; and meantime, he would have reluctantly to bid them farewell. Porteous was both surprised and vexed; his daughter was neither, for she felt it would be happier for them both to be apart—at least for the present.

LANDSLIPS.

SCARCELY less alarming than the fall of an avalanche, and sometimes, indeed, far more destructive, are those sudden descents of earth and other materials commonly known as landslips. The cause of these remarkable calamities—for such they commonly are—may be briefly described. The strata of a mountain or lesser elevation are often found to deviate considerably from a horizontal position; and if shale or any other substance pervious to water forms the lowest stratum, a landslip may take place. For instance, if there be an abundance of rain or melted snow, which percolates down so as to soften the lower stratum, the upper strata are liable to be loosened, and, in process of time, to slide away. Such was the case in Shropshire towards the close of last century, as related by Mr Fletcher of Madeley. This took place at a spot on the Severn between the Grove and the Birches. 'The first thing that struck me,' says Mr Fletcher, 'was the destruction of the little bridge that separated the parish of Madeley from that of Buildwas, and the total disappearing of the turnpike road to Buildwas Bridge. Instead of which, nothing presented itself to my view but a confused heap of bushes and huge clouds of earth, tumbled one over another. The river also wore a different aspect; it was shallow, noisy, boisterous, and came down from a different point. Following the track made by a great number of spectators who came from the neighbouring parishes, I climbed over the ruins and came to a field well grown with ryegrass, where the ground was greatly cracked in several places, and where large turfs—some entirely, others half-turned up—exhibited the appearance of straight or crooked furrows, as though imperfectly formed by a plough drawn at a venture. Getting from that field over the hedge into a part of the road which was yet visible, I found it raised in one place, sunk in another, concave in a third, hanging on one side in a fourth, and contracted as if some uncommon force had pressed the two hedges together. But the higher part of it surprised me most, and brought directly to remembrance those places of Mount Vesuvius where the solid stony lava had been strongly marked by repeated earthquakes; for the hard beaten gravel which formed the surface of the road was broken every way into huge masses, partly detached from each other, with deep apertures between them, exactly like the shattered lava. This striking likeness of circumstances made me conclude that the similar effect might proceed from

the same cause, namely, a strong convulsion on the surface, if not in the bowels, of the earth.'

This conjecture was not confirmed by facts and circumstances related by others; indeed, the latter part of his description proves, almost beyond question, that the various results described were occasioned by a landslip, and not by a shock of an earthquake, of which no one heard anything.

He continues: 'Going a little further towards Buildwas, I found that the road was again totally lost for a considerable space, having been overturned, absorbed, or tumbled, with the hedges that bounded it, to a considerable distance towards the river. This part of the desolation appeared then to me inexpressibly dreadful. Between a shattered field and the river, there was that morning a bank, on which, besides a great deal of underwood, grew twenty-five large oaks; this wood shot with such violence into the Severn before it, that it forced the water in great volumes a considerable height, like a mighty fountain, and gave the overflowing river a retrograde motion. This is not the only accident which happened to the Severn, for, near the Grove, the channel, which was chiefly of a soft blue rock, burst in ten thousand pieces, and rose perpendicularly about ten yards, heaving up the immense quantity of water and the shoal of fishes that were therein.'

John Phillips in his work on *Older* alludes to Marcle Hill as the scene of a landslip:

I nor advise, nor reprehend, the choice
Of Marcle Hill; the apple nowhere hangs
A kinder mould; yet 'tis unsafe to trust
Deceitful ground; who knows but that, once more,
This mount may journey, and, his present site
Forsaking, to thy neighbour's bounds transfer
The goodly plants, affording matter strange
For law debates.

Marcle Hill is near the confluence of the Lug and Wye, about six miles east of Hereford. In the year 1595, it was, says Mr Brown, the editor of White's *Selborne*, 'after roaring and shaking in a terrible manner for three days together, about six o'clock on Sunday morning put in motion, and continued moving for eight hours, in which time it advanced upwards of two hundred feet from its first position, and mounted seventy-two feet higher than it was before. In the place where it set out, it left a gap four hundred feet long, and three hundred and twenty broad; and in its progress it overthrew a chapel, together with trees and houses that stood in its way.'

That interesting naturalist, Mr White of Selborne, gives at length, in one of his letters to the Honourable Duimes Barrington, an account of an extraordinary landslip in his own neighbourhood, at a date corresponding with that of the landslip in Shropshire. He says: 'The months of January and February 1774 were remarkable for great melting snows and vast glutts of rain, so that, by the end of the latter month, the land springs, or *levants* [eastern; so called, I suppose, because of the prevalence of easterly winds at this season], began to prevail, and to be near as high as in the memorable winter of 1764. The beginning of March also went on in the same tenor, when in the night between the 8th and 9th of that month, a

considerable part of the great woody hanger [a local term for an overhanging woody cliff] at Hawkley was torn from its place and fell down, leaving a high freestone cliff naked and bare, and resembling the steep side of a chalk-pit. It appears that this huge fragment, being perhaps sapped and undermined by waters, founded, and was engulfed, going down in a perpendicular direction; for a gate which stood in the field on the top of the hill, after sinking with its posts for thirty or forty feet, remained in so true and upright a position as to open and shut with great exactness, just as in its first situation. Several oaks also are still standing [written in 1775 or 1776] and in a state of vegetation, after taking the same desperate leap.

'That great part of this prodigious mass was absorbed in some gulf below is plain also from the inclining ground at the bottom of the hill, which is free and unencumbered, but would have been buried in heaps of rubbish, had the fragment parted and fallen forward. About a hundred yards from the foot of this hanging coppice stood a cottage by the side of a lane; and two hundred yards lower, on the other side of the lane, was a farmhouse, in which lived a labourer and his family; and just by, a stout new barn. The cottage was inhabited by an old woman, her son, and his wife. These people, in the evening, which was very dark and tempestuous, observed that the brick floors of their kitchens began to heave and part, and that the walls seemed to open and the roofs to crack; but they all agree that no tremor of the ground indicating an earthquake was ever felt, only that the wind continued to make a tremendous roaring in the woods and hangers. The miserable inhabitants, not daring to go to bed, remained in the utmost solicitude and confusion, expecting every moment to be buried under the ruins of their shattered edifices. When daylight came, they were at leisure to contemplate the devastations of the night. They then found that a deep rift, or chasm, had opened under their houses, and torn them as it were in two, and that one end of the barn had suffered in a similar manner; that a pond near the cottage had undergone a strange reverse, becoming deep at the shallow end, and so vice versa; that many large oaks were removed out of their perpendicular, some thrown down, and some fallen into the heads of neighbouring trees; and that a gate was thrust forward with its hedge full six feet, so as to require a new track to be made to it. From the foot of the cliff, the general course of the ground, which is pasture, inclines in a moderate descent for half a mile, and is interspersed with some hillocks, which were lifted in every direction, as well towards the great woody hanger as from it. In the first pasture the deep clefts began, and running across the lane and under the buildings, made such vast shelves that the road was impassable for some time; and so over to an arable field on the other side, which was strangely torn and disordered. The second pasture-field, being more soft and springy, was protruded forward without many fissures in the turf, which was raised in long ridges resembling graves, lying at right angles to the motion. At the bottom of this inclosure, the soil and turf rose many feet against the bodies of some oaks that obstructed their

further course, and terminated this awful commotion.'

Passing by a number of catastrophes of this nature occurring at earlier dates, we propose to give some interesting particulars concerning one which took place in the early part of this century in Switzerland, where they are very frequent.

In one corner of the canton of Schweitz are the lakes Wallenstadt, Zug, and Lowert. 'Near the last is a mountain called the Righi, and a smaller one, the Rossberg. The latter is composed of strata of freestone, pudding-stone—a conglomerate of coarse sandstone, with silicious pebbles, flints, &c.; and clay, with frequent blocks of granite, in the lower part. On the 2d of September 1806, a large portion of this mountain—a mass about a thousand feet in width, a hundred feet in depth, and nearly three miles in length—slipped into the valley below. It was not merely the summit or a projecting crag which fell, but an entire bed of strata extending from the top to nearly the bottom. A long continuance of heavy rains had softened the strata of clay, which sloped downwards; and so the mass was set free, and slipped into the valley, a chaos of stones, earth, clay, and clayey mud. For hours before the catastrophe there had been signs of some convulsion approaching. Early in the morning and at intervals during the day there were noises as if the mountain were in the throes of some great pang, so that it seemed to tremble with fear; so much so, that the furniture shook in the houses of the villages of Arth and St Ann. About two o'clock, a superstitious farmer, who dwelt high up the mountain, hearing a strange kind of cracking noise, and thinking it was the work of some demon, ran down to Arth to fetch the priest to exorcise the evil spirit. There were now openings in the turf, and stones were ejected in a few instances. In the hamlet of Unter Rothen, at the foot of the mountain, a man was digging in his garden, when he found his spade thrust back out of the soil, and the earth spouted up like water from a fountain. As the day advanced, the cracks in the ground became larger, portions of rock fell; springs began to flow, and frightened birds took wing in confusion, uttering discordant screams.

About five o'clock, the vast mass of material set loose began to move. At first the movement was slow, and there were repeated pauses. An old man sitting at his door smoking his pipe, was told by a neighbour that the mountain was falling. He thought there was plenty of time, and went indoors to fill his pipe again; but his neighbour ran down the valley, falling repeatedly by reason of the agitation of the ground, and escaped with difficulty. When he looked back to the village, the old man's house had disappeared. In the space of about three minutes, the vast mass, separated into two portions, had descended three miles, sweeping everything before it. The smaller portion took a course towards the foot of the Righi, destroying the hamlets of Spitzbühl, Ober and Unter Rothen. Its velocity was such as to carry enormous fragments to a great height up the opposite mountain. A peasant who survived the calamity, was engaged in cutting down a tree near his house, when a noise like thunder arrested his attention; he felt

the ground tremble under his feet, and he was immediately thrown down by a current of air. Retaining his presence of mind, a dreadful scene presented itself; the tree he had been cutting down, his house, and every familiar object, had disappeared, and an immense cloud of dust enveloped him.

The ruin effected by the descent of the larger portion was more terrible. It took the direction of the Lake of Lowertz. Among its first victims were nine persons belonging to a party which had come from Berne to climb to the top of the Righi. Besides the village of Goldan, the adjacent villages of Bussingen and Hussloch, and three-fourths of the village of Lowertz, were overwhelmed. But the destruction did not stop here. The larger of the two portions filled up nearly one-fourth of the Lake of Lowertz. The body of water thus displaced formed a wave which swept over the little island of Schwanan in the lake, rising to the height of seventy feet, besides doing a great deal of mischief along the shore, especially to the village of Seewen.

By this disaster nearly five hundred persons lost their lives, and damage was done to the amount of one hundred and twenty thousand pounds. Of all the inhabitants, about twenty were taken alive from the ruins. Two out of a family of seven were saved as by a miracle. At the moment of the catastrophe the father was standing at his own door with his wife and three children. Seeing the mass rolling towards him, he caught up two of the children, bidding his wife follow him with the third. Instead of doing so, however, she turned back into the house to fetch the remaining child, Marianne, and Frances Ulrich, the servant-maid. Frances seized the little girl by the hand, and was leading her out, when the house, which was of timber, seemed to be torn from its foundations, and to turn over and over like a ball, so that she was sometimes on her head and sometimes on her feet. A storm of dust made the day dark as night. The violence of the shock separated her from the child, and she hung head downwards. She was squeezed and bruised a good deal, and her face was much cut and very painful. After some time she released her right hand, and wiped the blood from her face. She then heard Marianne groaning, and calling 'Frances, Frances!' The child said that she was lying on her back among stones and bushes, unable to rise; that her hands were at liberty, and that she could see the daylight and the green fields. Frances had imagined that they were buried a great depth underground; and thought that the last day was come.

After remaining in this state some hours, Frances heard a bell, which she knew to be that of the village church of Steinen, calling the survivors to prayer. The little girl was now crying bitterly from pain and hunger; and the servant-maid tried in vain to comfort her. From sheer exhaustion, however, the cry became weaker, and then ceased entirely. Meanwhile, Frances herself was in a most painful position, hanging with her head downwards, enveloped in the liquid clay, and cold almost beyond endurance. By persevering in her efforts, she at length got her legs free, and so obtained partial relief. A silence of some hours followed. When the dark hours

of that terrible night had passed and morning came, she had the satisfaction of knowing that the child was not dead, but had fallen asleep. As soon as she awoke, she began to cry and complain. The church bell now went again for prayers; and Frances heard also the voice of her master making lamentations over his loss. He had succeeded in escaping and rescuing the two children he had with him, though one was for a time partly buried in the fringe of the landslip. Seeking for the other members of his family, he had found the lifeless body of his wife with the child she had taken in her arms, at a distance of more than a quarter of a mile from where his house had stood. All of her that was visible was one of her feet. While digging out her body, he heard the cries of little Marianne. The child was at once disinterred from her living grave; and though one of her legs was broken, she seemed more anxious for the release of Frances than for her own comfort. The maid was soon extricated; but she was bruised and wounded in a frightful manner. For a long time her recovery was very doubtful. Even after she was out of danger, she was unable to bear the light, and was for a lengthened period subject to convulsions and seasons of extreme fear and terror.

A traveller who visited the district about a week after the catastrophe has given an interesting description of his visit: 'Picture to yourself a rude and mingled mass of earth and stone, bristling with the shattered remains of wooden cottages, and with thousands of heavy trees torn up by their roots and projecting in all directions. In one part you might see a range of peasants' huts, which the torrent of earth had reached with just force enough to overthrow and break in pieces, but without bringing soil enough to cover them. In another were mills broken in pieces by huge rocks, separated from the top of the mountain, which were even carried high up the Righi on the opposite side. Large pools of water were formed in different places; and many little streams, whose usual channels had been filled up, were bursting out in various places.'

THE WHITEBOYS OF SIXTY YEARS AGO.

THERE is living in our neighbourhood an old man, the son of a once famous 'Whiteboy.' As such, his bringing-up must have been strangely in keeping with the moonlighting propensities of the present day, and of which we unfortunately hear so much. But not so. 'Barry,' as we shall call him, has a horror of Land-leaguism, and will have nothing to do with it. His experience of the Whiteboys, or Moonlighters of sixty years ago, is interesting—at least to me; and I hope the following account will prove so to those who are not quite *au fait* with the doings of these confederations in Ireland sixty years ago.

Some time since, on the death of a relative, besides other effects willed to me, was a box containing several *curios*. Amongst them was a genuine letter written in 1823 by Captain Rock, in those days the Moonlight leader of

the Whiteboys. Knowing from Barry that his father had been not only an admirer of Captain Rock, but a follower of his, I showed him the letter, hoping that in doing so I would also verify its authenticity. It was as follows:

1 PEREVAL OF THE PEAK. 1

Notis.

Notis to Mistres H— And all Whoe it May pearsarn that Whin Capton Rock and His Adicongs visot yu next you Will take Kare to Have plenty of Mate and Prateses not Forgetting a Smol drop of the Crater.*

Sind—J. Rock. R.T.L.

given at our counsil this
10th day of April 1823.

'Sure, and that's a real letter, and no mistake,' said Barry, handing it back to me after perusal. 'I remember when I was a gorsoon [boy], my father writing letters just like it, when he and the Boys would meet of nights at our house. Many is the queer thing I heard them plan, when they thought I was asleep in bed; and though I forgets most of their doings now, I remembers a few; and I'll tell them same to you and welcome, if you likes to hear them. The Whiteboys, and the Bloodsuckers, and the Molly McGuire's resembles the Moonlighters of the present day; though they were not, so to say, as bad entirely, still they were fidgety creatures enough. 'Tis nigh on sixty years since my father died, and I was a tidy bit of a lad then. He was a follower of Captain Rock, the leader of what we called one kind of Whiteboys, in those days. Captn Rock was, you know, only an imaginary name, just as Captn Moonlight is in these times. I would not say as the Whiteboys in my father's time was as bad as those as followed them. They said nothing against paying the rent; and a good drop of the crater would do wonders with Captn Rock and his followers. Sure, 'twas hard in name he was, as my father used to say, and not in nature.

'The Bloodsuckers, who came next, were frightful creatures. They were so called because they took money to inform. 'Twas the price of blood, you see.

'The famine of 1845 had a demoralising effect on the people, and many and many the poor creature hreaking stones on the roadside had a pistol or some weapon of defence hid in the heap beside them. There was one gentleman you would like to hear about, maybe, who met with great troubles at the hands of the Boys. I knew him well, for many a pocketful of apples he gave me; and he was as hard-working and honest a creature as you'd meet with in a day's walk. The Boys had no ill-will against himself personally; but they thought to frighten him from taking a farm as was "useful to them," said Barry, with a knowing wink. 'The first thing they did was to send him a threatening

letter. Then a man as I knew full well—for many's the time he and my poor father laid their plans together—he was turned off to shoot him. He stood inside the road-wall where there was an old archway half built up—a mighty convenient place, as he afterwards said, to rest a gun on. But for all that, he didn't fire the shot that night, for reasons which you'll hear presently. The Boys were so disappointed, that two of them went at dusk one evening to the gentleman's own hall door and knocked. Sure enough, just as they thought, he opened it himself for them. On doing so, he saw the two Boys, one with a pistol, the other with a blunderbuss.

"Come out; you are wanted," says they to him.

"Yes," replied he; "but wait till I get my hat."

"Don't mind your hat," was the answer; "you'll do for us without it."

Just then the Missis came into the hall, and hearing the noise, off they went.

'Weeks afterwards, these men told the Master (as I shall call him, seeing I never likes to mention names) that had he gone in for his hat as he wanted to, they'd have shot him dead just where he stood, for they would have been afraid he was going for help.

"Why didn't you shoot me the night you were behind the old archway on the old Moiveen road?" he asked one of them.

"The night was cold," replied the Boy; "and the drop of the crater as the Captn sint me was that strong that it set me to sleep. I axes your pardon now for going to shoot you at all, for you are such a 'dacent' [plucky] man, you might be one of the Boys yourself. And to show you I has no ill-will agin you, if there is any little job as you wants done before marning' (meaning murder, of course), 'I'll do it for you meself and welcome."

'However, this didn't see the poor Master at the end of his troubles; there was more before him. A short time after, as the man was ploughing in the field, four of the Boys came and told him to stand aside. Then two of them held him, while the other two put a bullet through the head of each horse, and the poor creatures died the same night. The Boys broke the plough afterwards and warned the man away. They tied notices on it forbidding any one to plough for the Master till he gave up the idea of taking the farm, as Captn Rock wanted it for his own use.

'But the Master, he was an iligant man surely. Many's the time, gorsoon though I was, I'd have given my two eyes to help him; but though I was no Whiteboy, and I hated their dirty work, I was the son of one, and you know, "There is honour among thieves."—Well, as I was saying, the Master was an iligant, foinc man. Being a hit handy, he mended his plough, took it in his own hands, and with his loaded gun laid across it, did all the ploughing himself. Maybe you won't hardly credit me when I tell you that he did most of the work with a mule; and sometimes, to help the poor baste, when the ground was light, he yoked himself with her, whilst an old man who lived with the Master guided the plough. After this, the Boys,

* Irish poteen whiskey.

seeing they could not frighten him, let him alone.

'When the Bloodsuckers had had their day, next came the Molly M'Guire. 'Twas them as had the big blunderbuss called "Roaring Mag," which maybe you have heard tell of. There was an Englishman who came over to Ireland and laid down a weir to catch our salmon; but the Molly M'Guire would not have any foreigners con-fa-fishing to our shores, so they cut away the nets and destroyed the weir. Whenever they performed a bould feat such as this, they made poetry of it, writing it out, and giving a copy to the principal Molly M'Guire Boys. 'Tis many a year ago since four of the Boys, long since dead, wrote the piece I allude to; and I doubt if there is any one alive but meself who could repeat it for you; but I always had a good nimory,' concluded Barry proudly.

MOLLY M'GUIRE.

WRITTEN AND COMPOSED FOR THE
BOYS, BY FOUR OF 'EM.

approved of
by our council

Sind—MOLLY M'GUIRE.

'Twas of a Sunday morning,
All by the break of day,
When Molly M'Guire and her army
Came sailing down the say.
She heard 'Tom Spratt's' got down a weir
The salmon to insure.
But soon she did them liberate,
Once more to sport and play.

When Molly M'Guire came into the weir,
The salmon to ber did say:
'If you don't us liberate,
We'll surely die this day.'
But Molly bein' a commander bold,
She soon did give them orders
The salmon to liberate.

Pat Munster the spy
He scampered the police to bring down,
Sayin', there is an armed party
Came sailin' to this town
With their guns and bagnets screwed and fixed,
Besides the 'Roaring Mag;'
For they surely will cut down the weir;
They seem to be all mad.

The sargent cries: 'Come on, me boys;
We'll fire at them some shots.'
But Molly M'Guire made them soon retire,
Her army stood so brave.
She chases the police to their dens,
Like dogs that lost their tails;
For Molly M'Guire will rise the birc,
An' cut away the weirs.

'That's a fine piece of poetry, isn't it?' asked Barry, as he concluded this extraordinary medley, which cannot, I fear, be dignified by the name of rhyme, much less poetry. 'A grain of powder and shot and a glass or two of the crater would make a Molly M'Guire your friend for life, maybe. Sure, and many's the curious thing I've known, and many's the plan made in my hearing by the Boys and my father; but I would never tell on them, though I never had ought to do with their intrigues, as I call them. But though my poor father was a real Whiteboy, he never had, as I knows of, the

dark deeds on his conscience that some of them Moonlighters of the present days has. These is no times to be talking, leastways I keeps my thoughts to meself; but as you seemed anxious-like to hear of them that went before the Moonlighters, I am glad to oblige you. I have been able to do that without mentioning names; and there isn't many alive who could tell you as well as meself of the doings in Old Circland of sixty years ago.'

CONCISE AND TO THE POINT.

SPARTAN brevity* of speech is still sometimes amusingly illustrated. A most worthy man, unaccustomed to public speaking, being suddenly called upon to address a Sunday school, rose to his feet, and, after vainly struggling for utterance, at last hoarsely muttered: 'Dear children, don't over play with powder.'—The following gallant toast was lately given at a military dinner in Carolina: 'The ladies—our arms their protection—their arms our reward.'

'Don't eat stale Q-cumbers. They will W np,' is the terse advice of some wit.—Announcements on shop-signs expressed in the succinct style of one connected with a certain restaurant in New York, should serve as startling advertisements: 'Lunch, 75 cents; square meal, 1 dollar; perfect gorge, 1 dollar 25 cents.'—In the same city, a shopkeeper is said to have stuck upon his door this laconic advertisement: 'A boy wanted.' On going to his shop next morning, he beheld a smiling little urchin in a basket, with the following pithy label: 'Here he is!—A penny-a-liner would hardly find much employment on the Kansas paper which informed the public that 'Mr Blank of Missouri got to owning horses that didn't belong to him, and the next thing he knew he couldn't get his feet down to the ground.' Lynched, probably.—A Western writer, speaking of a new play just written by a gentleman of Cincinnati, says: 'The unities are admirably observed; the dullness which commences with the first act, never flags for a moment until the curtain falls.'

The characteristics of several nations have been summed up in the following concise form: The first thing a Spaniard does on founding a colony is to build a gallows; a Portuguese, to build a church; an Englishman, a drinking-booth; and a Frenchman, a dancing-floor.

A cobbler visited one of the large manufacturing the other day, and for the first time in his life saw shoes made by machinery. 'V'hat do you think of that?' asked the foreman.—'It heats awl,' was the laconic and significant reply.—A 'sensible' woman, as Dr Abernethy would have called her, was discovered by a shy man, who made her a rather original proposal. He bought a wedding ring, and sent it to the lady, inclosing a sheet of notepaper with the

* The big blunderbuss taken in Clare.

brief question, 'Does it fit?' By return of post he received for answer: 'Beautifully.'

It is related that Makart, the great Viennese painter, is even more taciturn than Von Moltke, the man who is silent in seven languages. An American, who had been told that the best way to get on friendly terms with the artist would be to play chess with him at the café to which he resorted nightly, watched his opportunity, and, when Makart's opponent rose, slipped into his chair. At last his dream was about to be realised, he was to spend an evening in Makart's society. The painter signed to him to play, and the game began, and went on with no other sound than the moving of the pieces. At last the American made the winning move, and exclaimed, 'Mate!' Up rose Makart in disgust and stalked out, saying angrily to a friend who asked why he left so early: 'Oh, I can't stand playing with a chatterbox!'

The expressions used by some boys and girls if written as pronounced would look like a foreign language. Specimens of boys' conversation like the following may be called short-hand talking: 'Warejejo lasnight?' 'Hadder skate.'—'Jerfind the ice hard'nood?' 'Yes; hard'nough.'—'Jer goerlone?' 'No; Bill'n Joe wenterlong.'—'Howlate jerstay?' 'Pastate.'—'Lemmeknow wenyergoin, woneher? I wantergonshower howto skate.'—'H—n, sicood'n skate bettor'n you I'd sell out 'uquit.' 'Well, we'll tryerace nseefyercan.'

The well-known answer of the Greeks to the Persian king before the battle of Thermopylae, was rivalled by the despatch of General Suvaroff to the Russian Empress: 'Hurrah! Ismail's ours!' The Empress returned an answer equally brief: 'Hurrah! Field-Marshal!'

The message from Lord Charles Beresford to his wife from the fort near Metemneh was pithy enough: 'Quite well and cheerful. Privations have been severe; thirst, hunger, battles desperate; but things look better.'

There are some quaint and pithy epistles on record. Quin, when offended by Rich, went away in resentment and wrote: 'I am at Bath.' The answer was as laconic, though not quite so civil: 'Stay there.'

Sibbald, the editor of the *Chronicles of Scottish Poetry*, resided in London for three or four years, during which time his friends in Scotland were ignorant not only of his movements, but even of his address. In the longrun, his brother, a Leith merchant, contrived to get a letter conveyed to him, the object of which was to inquire into his circumstances and to ask where he lived. His reply ran as follows: 'DEAR BROTHER—I live in So-ho, and my business is so-so.—Yours, JAMES SIBBALD.'

Concise and to the point was the enrious letter sent by a farmer to a schoolmaster as an excuse for his son's absence from school: 'Cepatomtogo-atatrin.' This meant, kep' at 'ome to go a-taterin' (gathering potatoes). A Canadian freshman once wrote home to his father: 'DEAR PAPA—I want a little change.' The fond parent replied by the next post: 'DEAR CHARLIE—Just wait for it. Time brings change to every one.'

Briefer than these was an epistle of Emile de Girardin to his second wife, with whom he lived on most unfriendly terms. The house was large

enough to permit them to dwell entirely separate from one another. One day, Madame de Girardin had an important communication to make to her husband. Taking a small sheet of paper she wrote: 'The Boudoir to the Library: Would like to go to Switzerland.'—M. de Girardin, imitating her concise style, responded: 'The Library to the Boudoir: Go.' That was all.

One of the most laconic wills on record ran thus: 'I have nothing; I owe a great deal.—the rest I give to the poor.'—A similar terse epitaph to the following would have suited that will-maker: 'Died of thin shoes, January 1839.'

PARTED.

Once more my hand will clasp your hand;
Your loved voice I shall hear once more;
But we shall never see the land,
The pleasant land we knew of yore;
Never, on any summer day,
Hear the low music of its streams,
Or wander down the leafy way
That leadeth to the land of dreams.

Still, borne upon the scented air,
The songs of birds rise clear and sweet,
As when I gathered roses there,
And heaped their glories at your feet;
And still the golden pathway lies
At eve across the western sea,
And lovers dream beneath those skies,
Which shine no more for you and me.

No more, ah, nevermore! and yet
They seem so near, those summer days,
When Hope was like a jewel set
To shine adown Time's misty ways;
I sometimes dream that morning's light
Will bring them back to us once more,
And that 'tis but one long dark night
Since we two parted by the shore.

We parted with soft words and low,
And 'Farewell till to-morrow,' said;
From sea and sky, the sunset's glow
A golden halo round you shed;
Then as you went, I heard you sing,
'Haste thee, sweet morrow'—parting thus,
How could we dream that life would bring
Not any morrow there for us?

We parted, and that last farewell
Its shadow on our life-path cast;
And Time's relentless barriers fell
Between us and our happy past;
And now we meet when cares and tears
Have dulled the parting and the pain,
But never can the weary years
Bring back our golden dreams again.

PRICE 1½d.

HOUSES WITH SECRET CHAMBERS.

THOUGH we have on former occasions referred to houses with lurking-places, or secret chambers, the subject seems to be of such interest as to warrant our giving some further examples.

Plowden Hall, county of Salop, with 'its gable ends, high chimneys, its floors, staircases, and doors of solid oak, and walls covered with oak panelling,' is described as being full of nooks and corners. There is a hiding-hole in the closet of one of the bedrooms, where the boards of the flooring are so arranged as to be easily moved; and underneath is a trap-door, by which a small ladder leads down into a dark hole where there is just room enough for a man to change his position with ease from a standing to a sitting posture. There is a shelf, on which the concealed person could eat his food. Tradition states that a priest was actually concealed there for a fortnight whilst Cromwell's soldiers were posted outside the gates; and that these were obliged to leave without having discovered him. Besides this hiding-place, there is an escape about the width and form of a chimney, reaching from one of the bedrooms down to the ground-floor of the house, to which a man might be lowered by means of a rope. There is also an outlet over the chapel through two trap-doors on to the roof, where a person might escape between the eaves of the house; and a portion of the flooring of the chapel is so formed as to lift up and cover a hiding-place below for concealing the sacred vessels.

Raglan Castle, Hallam, Derbyshire; Maple-Durham House, Oxon; Oxburgh Hall, Norfolk; Coughton Hall, Warwickshire; Harrowden, the seat of the Lords Vaux; and the old Manor-house, Long Clawson, each has its lurking-places and secret chamber. That in the last named quaint, old, picturesque-looking house is reached by the chimney of one of the sitting-rooms.

'White Welles House, which lies on the borders of Enfield Chase, is said to have been' full of holes, dark mysterious vaults, and subterranean passages.

Recusants and priests found refuge in Little Malvern Court in the days of their persecution, the position of one or two hiding-places in the roof being still pointed out.

A secret chamber in Lowstock Hall, in the parish of Bolton, Lancashire, which was pulled down in 1816, was associated with blood-stains on the hearthstone of one of the rooms, and the supposed murder of a priest in the troublous times.

In connection with Yorkshire, the old Red House is made mention of as having had a secret chamber and gallery underneath the roof. These were brought to light some years ago when workmen were employed in making repairs and alterations on the mansion. The noted royalist, Sir Henry Slingsby, lay for a time concealed in the hiding-place thus skillfully contrived; but venturing forth one moonlight night to enjoy the freedom of a walk in his garden, he was seen by a servant-man, who betrayed him to his enemies; and soon after the gallant old colonel was seized, conveyed to London, and beheaded on Tower Hill.

Kingerby Old Hall, situated in the same county, was also possessed of one or more secret chambers.

Ashbourne Place, in Sussex, which was said to have been built by a brother of Bishop Juxon, was often made use of as a place of refuge by that persecuted prelate after the death of Charles I. At the time when his royal master was beheaded, Juxon was Bishop of London and Clerk of the Closet; and being implicitly trusted by his royal master, to whom he was devotedly attached, he received his last confidences on the scaffold, and his George, with the oft-referred-to word, 'Remember!' The father of the present proprietor of Ashbourne, in opening a communication between the back and front chambers, discovered a room, the existence of which was previously unknown, and to which access could only have been gained through the chimney. In all probability, this curious retreat was Bishop Juxon's hiding-place.

There is a gallery situated in the attic story of the mansion at Stanford Court, in Worcestershire, in which Arthur Salwin—an ancestor of the present proprietor of the estate, who lived in the reigns of Elizabeth and James I.—and his four sons and seven daughters, together with others of their kindred, are portrayed on the oak-panelled walls of the room in the costume of the day; the ladies in embroidered dresses, with jewelled ornaments. Underneath each figure is a motto in Latin. Behind the panels are secret passages, which, previous to the alterations of modern times, extended over a great part of the mansion.

Sanston Hall, the seat of the ancient family of Huddleston, in Cambridgeshire, was destroyed on account of the owner's adherence to the ancient faith, and rebuilt in the time of Queen Mary, when the precaution was taken to erect a chapel in the roof. It is approached by a winding staircase, which also gives access to a secret chamber. In the hiding-place near the chapel in the roof at the top of the old winding staircase, there were found some oyster-shells; and a fowl's bone was picked up in the one belonging to Lydiate Hall—relics of some poor prisoner's solitary meal.

Upton Court, near Reading, the former residence of the Perkyns family, has also its hidden retreat, which is difficult of access, being approached by a trap-door in the midst of a chimney-stack near the lesser Hall.

About the beginning of the present, or the end of last century, a secret chamber was accidentally discovered in the ancient mansion of Bourton-on-the-Water, a 'large rambling house of many gables,' situated in Gloucestershire. The door appeared on tearing off the paper which was about to be removed. It was on the second (or upper) floor landing-place, and opened into a small chamber about eight feet square, containing a chair and a table. On the back of the former lay a black robe; and the whole had the appearance as if some one had recently risen from his seat and left the room. On the same floor there were several other apartments, of which three only were in use, the other (called the Dark Room) having been locked up for many years. Of the three in use, one was styled the Chapel, and another the Priest's Room. The former had a vaulted roof or ceiling. All three were supposed by the villagers to be haunted, and they had been known by the above appellations in the family long anterior to the discovery of the door. This interesting old mansion was sold in 1608 to Sir Thomas Edwards, treasurer of the royal household, and subsequently privy-councillor to Charles I., and it was probably during his occupancy that Charles is said to have passed the first night there on his way from Oxford. Since 1834, this house—except a small part of the south front—was pulled down, the fine old trees in which it was embosomed felled, the shrubberies made away with, the pleasure-

grounds converted into pasture, and the remains of the house into a dispensary!

The hiding-place in Heale House, near Amesbury, in Wilts, for several days formed a retreat for King Charles II. after the battle of Worcester.

In the course of this century, a movable panel was discovered in a small panelled room in the old manor-house of Chelvey, county of Somerset. This aperture, for some unexplained reason, was closed up hastily, and the spring by which it was opened was said to be lost. In an adjoining room, which was much larger, and panelled in a similar manner, there was a cupboard, the floor of which—afterwards nailed down—had been formerly movable. Underneath was a short flight of steps, which again ascended, and led to a pretty long but very narrow room at the back of the fireplace. This concealed chamber was furnished with an iron sence projecting from the wall, to hold a candle, and was also provided with a small fireplace.

Parham, which belongs to the Curzon family, has a secret chamber close to the chapel in the roof of the house, and the way down to it is through a bench standing out from the wall.

Captain Dutly, in his *History of Hampshire*, says 'that the old house at Hinton-Ampner, in that county, was subjected to the evil report of being haunted; that strange and unaccountable circumstances did occur there, by which the peace and comfort of a most respectable and otherwise strong-minded lady, at that time occupier of the mansion, were essentially interfered with by noises and interruptions that to her appeared awful and unearthly, and which finally led to her giving up the house. Afterwards, on its being taken down, it was discovered that in the thickness of the walls were secret passages and stairs not generally known to exist, which afforded peculiar facilities for any one carrying on without detection the mysteries of a haunted house.'

The following extract, taken from a state paper in the public Record Office, is preserved among others relating to the Rebellion of 1745, and obviously has reference to the search that was being made all over the country for suspected persons. Worksp Manor as it then stood is said to have been burned down in 1761. Examination of Elizabeth Brown, taken upon oath before Richard Bagshaw, the 24th November 1745.—'Who says that nine years ago last spring, upon that Easter Monday, she, Catherine Marshall, and another young woman, went to Worksp Manor to see Elizabeth Walkden, who lived as a servant with the Duke of Norfolk there; and desiring to look at the house, she said Elizabeth Walkden, she believed, showed them, most of the rooms of the house; and at last coming upon the leads of the house, and walking and looking about them, she said Elizabeth Walkden said she would let them see a greater variety than they had yet seen; after which she raised up the ledge of a sheet of lead with her knife till she got her fingers under it, and then she

desired them to assist her, which they did; and then under that she took up a trap-door where there was a flight of stairs, which they went down, into a little room which was all dark; that the said Elizabeth Walkden opening the window-shutter, there was a fireplace, a bed, and a few chairs in the said room; and asking her what use that room was for, she said it was to hide people in trouble—sometimes. Then the said Elizabeth Walkden went to the side of the room next to the stair-foot; and opened a door in the wainscot about the middle of the height of the room, which they looked into, but it being dark, they could not see anything in it; but the said Elizabeth Walkden said they could not go into it, as it was full of arms; upon which the said Elizabeth Walkden shut the door, and they went up-stairs; and then she shut the trap-door, and laid down the sheet of lead as it was before, which was so nice she could not discern it from another part of the lead, and believes she could not find it if she were there again.

In a very old house entered from the High Street of Canterbury, and nearly facing Mersey Lane, which leads straight to the cathedral, one of the rooms had a window opening into an adjoining church. In the thickness of the walls there were two or three secret stairs. It was said to have been a nunnery formerly; and that a subterranean passage, it was ascertained, used to unite it with the cathedral.

Woodcote, Hampshire; Coldham House, Suffolk; Watcomb and Maple-Durham, Berkshire; Stonyhurst in Lancashire; Treaga, Herefordshire; Harborough Hall, situated midway between Hagley and Kidderminster, all had their secret chambers; and the ancient seat of the Tiebournes was similarly provided, together with a complication of secret passages and stairs.

Compton Wynnyates, a remote and picturesque mansion belonging to the Marquis of Northampton, has an upper chapel in the topmost gable, with ancient wooden altar, three staircases leading to the Priest's room in the lower story, secret passages, and hiding-places behind the wainscoting spacious enough to hold one hundred persons in case of alarm. The existence of such a chapel sufficiently indicates that the rites of the old religion were practised in private, although the Protestant place of worship remained open below.

In Essex, the Wisemans of Braddox or Broad-oaks were of the number of those who suffered during the reigns of Elizabeth and James for their noted 'harbouring of priests.' In *P. R. O. Dom. Elizabeth*, vol. 244, n. 7, may be seen two forms of indictment of Richard Jackson, priest, for saying mass at Braddox, and of various members of the Wiseman family for being present at mass on the 26th August and the 8th of September 1592. Again: 'Mr Worseley and Mr Newall have been to Widow Wiseman's house in Essex, and found a mass preparing; but the priest escaped.' There were two hiding-places in Braddox: the most important of these adjoined the chapel, and was constructed in a thick wall of the chimney, behind a finely laid and carved mantel-piece.

In connection with the old mansion of the Carylls at West Grinstead, the Abbé Denis tells us that it also has two hiding-places. 'One of these is between the mantel-piece and ceiling of

the dining-room; and the way to get to it is to go up the flue of the chimney as high as the ceiling of the room on the second floor; and then, by an aperture in the side of the chimney or flue, to drop down into the hiding-hole. Another opening also exists in the chimney of the room above. The second place of concealment is quite underneath the roof of the house. It had likewise two ways of access—the one from an attic, the other from a closet or small room underneath.' In Denton, the original seat of the Carylls in Sussex, there is one on the ground-floor between two kitchen chimneys, which is entered by an opening in the room at the back. At New Building, a house more recently erected by the Carylls, there are also two secret rooms; one on the second floor, formed in the thickness of the wall between two chimneys, but entered by a concealed door in one of the two adjoining rooms. The other is in the opposite gable, and is entered from the room on the ground-floor below, through the top of a cupboard which stands in the wall close to the chimney.

The walls of the 'ancient moated and turreted mansion' of Lyford, Berks, were 'pierced with concealed galleries and hiding-places'; one of the latter was excavated in the wall above the gateway.

Several 'hiding-holes' have also come to light in the fine old house of Sutton Place, near Guildford, Surrey; and some years ago, a 'most beautifully embossed leather casket, iron-bound, containing relics of some of the martyred priests,' was found in one of these places of concealment behind the wainscot panelling of the chapel. A curious printed volume entitled *A Sure Haven against Shipwreck* was found concealed 'between the floor and the ceiling.' It would seem that Brother Nicholas Owen, alias Little John, S.J., 'that useful cunning joiner of those times,' was the constructor of many of these secret rooms, to be found in the greater portion of our 'stately homes of England,' for we read in *Records of the English Provinces* that 'he was divers times hanged upon a Topcliff rack in the Tower of London, to compel him to betray the hiding-places he had made up and down the land.' This said 'skilful architect' was afterwards seized, according to the same authority, in company with Fathers Garnet and Oldcorne, in one of the numerous hiding-places in Hendlip House, near Worcester, already referred to in No. 1040 of this *Journal*. The secret chamber in which these Jesuit Fathers were concealed is thus described in Lingard's *England*: 'The opening was from an upper room through the fireplace. The wooden border of the hearth was made to take up and put down like a trap-door, and the bricks were taken out and replaced in their courses whenever it was used.' The former Westons of Sutton Place were well known to government as shelterers of priests. It was searched on the 5th of November 1578, by order of the Privy-council, for 'popish priests;' and again on the 14th of January 1591, for one Morgan, a 'massing priest,' supposed to be 'lurking there in secret sort.'

The far-famed 'Burlleigh Park by Stamford Town' is also in possession of a secret chamber. This concealed apartment, of whose existence the

family were altogether unaware, was brought to light in the course of this century through the instrumentality of the law agent, and was found to contain furniture of an old-fashioned description, together with several framed engravings. These latter, when agitated by the wind, which found its way in through a broken window-pane, struck against the wall, thereby producing a flapping noise, which had long procured for the adjoining sleeping apartment the designation of 'the Haunted Room.'

The grand old historic mansion of Knebworth, Herts, like others of similar age and importance, possessed trap-doors, hiding-places, &c.; and underneath a room adjoining the so-styled 'Haunted Chamber,' and belonging to one of the square towers of the gateway, there was a mysterious room or *oubliette*, of which the late Lord Lytton thus speaks: 'How could I help writing romances, when I had walked, trembling at my own footsteps, through that long gallery with its ghostly portraits, mused in these tapestry chambers, and passed with bristling hair into the shadowy abysses' of the secret chamber. This portion of Knebworth was pulled down in 1812.

Referring to houses north of the Burder having secret chambers, Sir Walter Scott says: 'There were few Scottish houses belonging to families of rank which had not such contrivances, the political incidents of the times often calling them into occupation.' 'The concealed apartment opening by a sliding panel into the parlour, in the old mansion-house of Swinton, is made good use of by Sir Walter in his beautiful novel of *Peveril of the Peak*.

Some ten or twelve years ago, while workmen were employed in making alterations at the house of Nunraw, near the village of Carvald, Haddingtonshire, they came upon a secret chamber in the depth of one of the walls, which on inspection was found to contain some mummies, pictures, and other property. In olden times, Nunraw was a nunnery belonging to the priory of Haddington, and though modernised, still exhibits evident marks of great antiquity.

There is an apartment now used as a bedroom in Sir George Warrender's house at Brunsfield, near Edinburgh, which, however, can hardly be called a secret chamber, inasmuch as it possesses windows and two external walls, but having the interior walls on both sides of the entrance of great thickness. The history of this room is somewhat obscure. It is said to have been used as a place of concealment for certain Jacobites after the rebellion of 1745; and blood-stains, which are still distinctly visible on the floor, point remotely to this theory. Another story is that a cadet of the house of Warrender returned from Carlisle about 1760, and shortly afterwards died in this room, which was immediately bricked up, so that all evidences of the event might be removed. In any case, the room had remained sealed up beyond the recollection of any one familiar with the house, and the ivy with which the walls were at this time covered, had almost entirely obliterated any external traces. It was rediscovered about sixty years ago by Lee, the English landscape painter, who, when sketching the house, found himself putting in windows of which he could not remember the rooms. When opened, the room presented the appearance of

having been left hurriedly, by a departing guest, everything being in disorder, even to the ashes left undisturbed in the grate. Brunsfield House dates from 1605.

BY ORDER OF THE LEAGUE.

CHAPTER V.

THE weeping woman looked up, and beheld the loveliest face she had ever seen. The girl standing before her possessed all the attributes of southern beauty. Her hair, which was long and luxuriant, hung in one thick plait down her back, and lay in careless waves upon a forehead pure as chiselled marble; her face was full, with deep red flushed under the transparent skin; her features exquisitely moulded; whilst her eyes, deep as running water, conveyed an air of pride and power—a sense of passion equally capable of looking implacable hate or fondest love. They were commanding now, as the woman looked up in the stranger's face.

'Who are you?' she asked wonderingly.

'Men call me Isodore,' the stranger replied in a voice singularly sweet. 'I have no other name. Will you let me look at the coin you have in your hand?'

Never dreaming of refusing this request, the woman handed over the gold piece to the girl, who looked at it long and intently. Her eyes were hard and stern when she spoke again. 'Where did you get this?' she asked.

'It was given me to stake at the table. I noticed that it bore some device, and I exchanged it for a coin of my own.'

'It has no meaning to you! It is not possible you are one of us!'

'I do not understand you,' the woman replied. 'It is a curious coin. I have seen one once before—that is all I know of it.'

'Listen!' the girl said in a hushed voice. 'You do not comprehend what its possession means to you. It is the symbol, the sign of membership of the strongest political Brotherhood in Europe. If it was known to be in your possession, your life would pay the forfeit; it would be regained at all hazards. If one of the Brotherhood knew another had deliberately parted with it, I would not give a hair for his life.'

'And he is in danger of his life!' the woman cried, starting to her feet. 'Give it me, that I may return it to him.'

'No!' was the stern reply; 'he does not get off so easily. We do not temper the wind thus to traitors.—Woman! what is Hector le Gautier to you, that you should do this favour for him?'

'He is a man, and his life is in danger. It is my duty.'

'Mark me!' Isodore replied with stern emphasis. 'I have not the eyes of a hawk and the bearing of a hare for nothing. I was opposite you in the saloon, and I know that something more than womanly sympathy prompts you. I saw the struggle in Le Gautier's face; I saw you start and tremble as he spoke to you; I saw you change the coin for one of yours, and I saw you weeping over it just now. Woman! I ask again what is he to you?'

Slowly the words came from the other's lips,

as if forced from them by some mesmeric influence. 'You are right,' she said; 'for—heaven help me—he is my husband! I am Valerie le Gautier.—Now, tell me who you are.'

'Tell me something more. How long has he been your husband?'

'Nine years—nine long, weary years of coldness and neglect, hard words, and, to my shame, hard blows. But he tired of me, as he tires of all his toys: he always tires when the novelty wears off.'

'Yes,' Isodore said softly, 'as he tired of me.'

'You!' exclaimed Valerie le Gautier, starting—'you! What! and have you, too, fallen a victim to his treachery? If you have known him, been a victim to his perfidy, then, from the bottom of my heart, I pity you.'

'And I need pity.'

For a short space neither spoke, as they sat listening to the murmur of the leaves in the trees, broken every now and then by the sounds of play or laughter within the glittering saloon. Isodore's face, sad and downcast for a moment, gradually resumed its hard, proud look, and when she spoke again, she was herself.

'We have a sympathy in common,' she said.

'We have a debt to pay, and, by your help, I will pay it. Justice, retribution is slow, but it is certain. Tell me, Valerie—if I may call you by your name—how long is it since you saw your husband till to-night?'

'Seven years—seven years since he deserted me cruelly and heartlessly, leaving me penniless in the streets of Rome. I had to live how I could; I even begged sometimes, for he has squandered the little money I brought to him.'

'Do you think he knew you to-night?' Isodore asked.

'Knew me?' was the bitter response. 'No, indeed. Had he known I was so near, he would have fled from my presence.'

'He laughs at us, no doubt, as poor defenceless women. But time will show. I can ever find an hour in the midst of my great work to watch his movements. I have waited long; but the day is coming now.—Would you know the latest ambition of your honourable husband? He intends to get married again. He has dared to lift his eyes to Enid Charteris.'

'Hector dares to marry again!' Valerie exclaimed, 'and I alive? Oh, I must take vengeance, indeed, for this.'

She drew a long breath, shutting her lips tightly. The passion of jealousy, long crushed down, rose with overwhelming force; she was no longer a weak defenceless woman, but a fury, maddened and goaded to the last extremity.

Isodore watched her, well pleased with this display of spirit. 'Now you speak,' she said admiringly, 'and I respect you. All your womanhood is on fire within you to avenge the wrongs of years, and it shall be no fault of mine if they slumber again. Yes, your perfect husband designs to wed again.'

'I believe you are a witch. You have roused my curiosity; you must tell me more than this.'

'Hector le Gautier is in love,' Isodore replied, 'a world of quiet scorn running through her

words, 'and, strange as it may seem, I believe true. An English girl—Enid Charteris, with the blue eyes and fair hair—has bewitched him; satiated as he is with southern beauty.—You look surprised! I have the gift of fern-seed, and walk invisible. All these things I know. The Order is to be betrayed when the pear is ripe, and the traitor will be Hector le Gautier. The price of his treachery will enable him to become respectable, and lead a quiet life henceforward with his loving fair-haired bride. Poor, feeble, calculating fool!' The bitter scorn in these words was undecipherable, and round the speaker's lips a smile was wreathed—a smile of placid unrelenting hate and triumph strangely blended.

'It shall never be,' Valerie cried passionately, 'while I can raise my voice to save an innocent girl from the toils of such a scoundrel!—Yes,' she hissed out between her white clenched teeth, 'it will be a fitting revenge. It would be bliss indeed to me if I could stand between them at the altar, and say that man is mine!'

'He is ours,' Isodore corrected sternly; 'do not ignore that debt entirely. Be content to leave the plot to me. I have worked out my scheme, and we shall not fail. Five years ago, I was a child, happy on the banks of my beloved Tiber. It was not far from Rome that we lived, my old nurse and I, always happy till he came and stole away my heart with his grand promises and sweet words. Six short months sufficed him, for I was only a child then, and he threw away his broken plaything. It made a woman of me, and it cost me a lover worth a world of men like him. I told him I would have revenge. He laughed then; but the time is coming surely. I have a powerful interest in the Brotherhood; he knows me by name, but otherwise we are strangers. To-night, I saw my old lover in his company. Ah, had he but known!—Come, Valerie; give me that coin, the lucky piece of gold which shall lure him to destruction. Come with me; I must say more to you.'

Mechanically, Valerie le Gautier followed her companion out of the Kursaal gardens, through the streets, walking till they got a little way out of the town. At a house there, a little back from the road, Isodore stopped, and opened the door with a pass-key. Inside, all was darkness; but taking her friend by the hand, and bidding her not to fear, Isodore led her forward along a flagged passage and up a short flight of steps. Opening another door, and turning up the hanging lamp, she smiled. 'Sit down,' she said, 'my sister that is to be. You are welcome.'

The apartment was somewhat large and lofty. By the light from the silver lamp, suspended from the ceiling in an eagle's beak, the stranger noticed the room with its satin-wood panels running half way up the walls, surmounted by crimson silk hangings, divided over the three long windows by gold cords; a thread of the same material running through the rich upholstery with which the place was garnished. The floor was paved with bright coloured woodwork of some mysterious design; and heavy rugs, thick and soft to the feet, scattered about sufficient for comfort, but not enough to mar the beauty of the inlaid floor. Pictures on china plates let into the hangings

were upon the walls; and in the windows were miniature ferneries, a little fountain plashing in the midst of each. There was no table in the room, nothing whereon to deposit anything, save three brass stands, high and narrow; one a little larger than the rest, upon which stood a silver spirit-lamp under a quaint-looking urn, a chocolate pot to match, and three china cups. There were cosy-looking chairs of dark massive oak, upholstered in red silk, with the same gold thread interwoven in all. A marble clock, with a figure of Liberty thereon, stood on the mantel-piece.

Isodore threw herself down in a chair. The other woman took in the scene with speechless rapture; there was something soothing in the harmonious place. 'You are pleased,' Isodore said with a little smile of pleasure, as she surveyed the place. 'This is my home, if I can call any place a home for such a wanderer; but when I can steal a few days from the cares of the cause, I come here. I need not ask you if you like my apartments?'

'Indeed, I do,' Valerie replied, drawing a long breath of delight. 'It is absolutely perfect. The whole thing surprises and bewilders me. I should not have thought there had been such a place in Homburg.'

'I will give you another surprise,' Isodore laughed, 'before the evening is over. I am the princess of surprises; I surprise even the followers who owe me loyal submission.'

'Ah! had I such a paradise as this, I should forswear political intrigue. I should leave that to those who had more to gain or to lose by such hazards. I should be content to let the world go on, so that I had my little paradise.'

'So I feel at times,' Isodore observed with a little sigh. 'But I am too deeply pledged to draw my hand back now. Without me, the Order is like an army deprived of its general; besides, I am the creature of circumstance; I am the sworn disciple of those whose mission it is to free the down-trodden from oppression and to labour in freedom's name.' As she said these words, the sad look upon her brow cleared away like mist before the sun, and a proud light glistened in the wondrous eyes. Half ashamed of her enthusiasm, she turned to the stand by her side, and soon two cups of chocolate were frothed out of the pot, filling the room with its fragrance. Crossing the floor, she handed one of the cups to her new-found friend. For a moment they sat silent, then Isodore turned to her companion smilingly.

'How would you like to go with me to London?' she asked.

'I would follow you to the world's end!' was the fervid reply; 'but there are many difficulties in the way. I have my own living to get, precarious as it is, and I dare not leave this place.'

'I permit no difficulties to stand in my way,' Isodore said proudly; 'to say a thing, with me, is to do it. Let me be candid with you, Valerie. Providence has thrown you in my path, and you will be useful to me; in addition, I have taken a fancy to you. Yes,' she continued fervently, 'the time has come—the pear is ripe. You shall come with me to London; you have a wrong as well as I, and you shall see the height

of Isodore's vengeance.' Saying these words in a voice quivering with passionate intensity, she struck three times on the bell at her side. Immediately, in answer to this, the heavy curtain over the door parted, and a girl entered.

She was Isodore's living image; the same style and passionate type of face; but she lacked the other's firm determined mouth and heughtness of features. She was what the lily is to the passion-flower. Her eyes were bent upon her sister—for she was Lucrece—with the same love and patient devotion one sees in the face of a dog.

'You rang, Isodore?' she asked; and again the stranger noticed the great likeness in the voice, save as to the depth and ring of Isodore's tones.

'Yes, Lucrece, I rang,' the sister replied. 'I have brought a visitor to see you.—Lucrece, this lady is Hector le Gautier's wife.'

'Le Gautier's wife?' the girl asked with startled face. 'Then what brings her here? I should not have expected'—

'You interrupt me, child, in the midst of my explanations. I should have said Le Gautier's deserted wife.'

'Ah!' Lucrece exclaimed, 'I understand.—Isodore, if you collect under your roof all the women he has wronged and deceived, you will have a large circle. What is she worth to us?'

'Child!' Isodore returned with some marked emphasis on her words, 'she is my friend—the friend of Isodore should need no welcome here.'

A deep blush spread over the features of Lucrece at these words, as she walked across the room to Valerie's side. Her smile was one of consolation and welcome as she stooped and kissed the other woman lightly. 'Welcome!' she said. 'We see both friends and foes here, and it is hard sometimes to tell the grain from the chaff. You are henceforward the friend of Lucrece too.'

'Your kindness almost hurts me,' Valerie replied in some agitation. 'I have so few friends, that a word of sympathy is strange to me. Whatever you may want or desire, either of you, command me, and Valerie le Gautier will not say you nay.'

'Lucrece, listen to me,' said Isodore in a voice of stern command. 'To-morrow, we cross to London, and the time has come when you must be prepared to assist in the cause.—See what I have here!' Without another word, she placed the gold moldire in her sister's hand.

Lucrece regarded it with a puzzled air. To her simple mind, it merely represented the badge of the Brotherhood.

'You do not understand,' Isodore continued, noticing the look of bewilderment. 'That coin, as you know, is the token of the Order, and to part with it knowingly is serious'—

'Yes,' Lucrece interrupted; 'the penalty is death.'

'You are right, my sister. That is Le Gautier's token. He staked it yonder at the Kursaal, giving it to his own wife, though he did not know it, to put upon the colour. The coin is in my hands, as you see. Strange, how men become fortune's fool!'

'Then your revenge will be complete,' Lucrece

suggested simply. 'You have only to hand it over to the Council of Three, or even the Crimson Nine, and in one hour'—

'A dagger's thrust will rid the world of a scoundrel.—Pah! you do not seem to understand such feeling as mine. No, no; I have another punishment for him. He shall live; he shall carry on his mad passion for the fair-haired Enid till the last; and when his cup of joy shall seem full, I will dash it from his lips.'

'Your hate is horrible,' Valerie exclaimed with an involuntary shudder. 'I should not like to cross your path.'

'My friends find me true,' Isodore answered sadly; 'it is only my enemies that feel the weight of my arm.—But enough of this; we need stout hearts and ready brains, for we have much work before us.'

Three days later, and the women drove through the roar and turmoil of London streets. They were bent upon duty and revenge. One man in that vast city of four or five million souls was their quarry.

CHAPTER VI.

Mr Varley, Sir Geoffrey Charteris's valet and factotum, and majordomo in the baronet's town residence, Grosvenor Square, was by no means devoid of courage; but the contents of the note he was reading in the hall one fine morning early in May were sufficient to put to flight for the moment any vengeful schemes he was harbouring against the wily gentleman who has just quitted the house, and that gentleman no less a person than our old friend Le Gautier.

Timothy Varley was an Irishman, and had been in his youth what is termed a patriot. In his hot blood he had even joined a League for the 'removal of tyrants;' but the League, in spite of its solemn form and binding oaths, had died a natural death. At times, however, the recollection of it troubled Mr Varley's conscience sorely. It was destined to be brought to his mind now in a startling manner.

'G. S. I. You will be at the corner of Chapel Place to-night at nine. A girl will meet you, and show you the way. You are wanted; your turn has come. Do not fail.—NUMBER XI.'

Never did Boh Acres, in that celebrated comedy, *The Rivals*, feel the courage oozing from his finger-tips as did Timothy Varley now. He turned the missive over in his fingers; but no consolation was to be derived from that; and bitterly did he revile the juvenile folly that had placed him in such a position at this time of life.

'It is no sham,' he muttered to himself. 'God save Ireland—that is the old countersign; and to think of it turning up now! I had forgotten the thing years ago. This comes of joining secret societies—a nice thing to bring a respectable family man to! Now, by the powers! who was Number Eleven? That used to be Pat Mahoney; and a mighty masterful man he was, always ready with his hands if anything crossed him. O dear, O dear! this is a pretty thing. Maybe they want to mix me up with dynamite; but if they do, I won't do it, and that's flat. I suppose I shall have to go.'

Giving vent to these words in a doleful tone of voice, he betook himself to his private sanctum. His spirits were remarked to be the reverse of cheerful, and he declined a glass of sherry at lunch, a thing which roused much speculation below stairs.

Punctual to the moment, Timothy Varley stood in Chapel Place waiting for his unknown guide. Just as he was beginning to imagine the affair to be a hoax, and congratulating himself thereon, a woman passed him, stopped, and walked in his direction again. 'God save Ireland!' she said as she repassed.

'Amen, not forgetting one Timothy Varley,' he returned piously.

'It is well,' the woman replied calmly, 'that you are here. Follow me!'

'With the greatest of pleasure.—But hark here; my legs are not so young as yours: if we are going far, let us have a cab, and I'll stand the damage.'

'There is no occasion,' the stranger said in a singularly sweet voice. 'We have not a great distance to travel.'

'Not good enough to ride in the same carriage with a gentleman's gentleman,' Varley muttered, for he did not fail to note the stranger's refined tones.

His guide led him along Tottenham Court Road, and thence to Fitzroy Square. Turning into a little side-street, she reached at length a door, at which she knocked.

In a room on the first floor, Isodore and Valerie le Gautier were seated, waiting the advent of Lucrece and the stranger. Varley began to feel bewildered in the presence of so much beauty and grace; for Isodore's loveliness overpowered him, as it did all men with whom she came in contact. Scarcely deigning to notice his presence, she motioned him to a chair, where he sat the picture of discomfiture, all traces of the audacious Irishman having disappeared.

'Your name is Timothy Varley?' Isodore said.

'Yes, miss; leastways, it was when I came here, though, if you were to tell me I was the man in the moon, I couldn't say nay to you.'

'I know you,' Isodore continued. 'You were born near Mallow, joined the United Brotherhood thirty years ago, and your Number was Twenty-six. If I am wrong, you will please correct me.'

'For goodness' sake, miss—my lady, I mean—don't speak so loud. Think what might happen to me if any one knew!'

'No wonder your countrymen fail, with such chicken-hearts among them,' Isodore observed scornfully. 'I do not want to do you any harm; quite the contrary. There is an advertisement in to-day's *Times*. Your mistress is in search of a maid. Is that so?'

Timothy Varley began to breathe a little more freely. 'Yes,' he answered glibly; 'she does want a maid. She must be honest, sober, and industrious; ready to sit up all night if necessary, and have a good temper—not that Miss Enid will try any one's temper much. The last girl was discharged.'

'Now, Mr Varley, I know a girl who must fill that vacancy. I do not wish to threaten you or hold any rod of terror over your head;

but I shall depend upon you to procure it for my protégée.

The conversation apparently was not going to be so pleasant. Timothy Varley's mind turned feebly in the direction of diamond robberies.

'Well, miss—that is, my lady—if I may make so bold as to ask you a question: why, if the matter is so simple, don't you write to my young mistress and settle the matter that way?'

'Impossible,' Isodore replied, 'for reasons I cannot enter into with you. You must do what I ask, and that speedily.—You have a certain Monsieur le Gautier at your house often?'

This question was so abruptly asked, that Varley could not repress a start. 'We have,' he growled—'a good deal too often, to please me. My master dare not call his body his own since he first began to come to the house with his signs and manifestations.—You see,' he explained, 'servants are bound to hear these things.'

'At keyholes and such places,' Isodore smiled. 'Yes, I understand such things do happen occasionally. So this Le Gautier is a spiritualist, is he; and Sir Geoffrey is his convert?'

'Indeed, you may say that,' Varley burst out in tones of great grievance. 'The baronet sees visions and all sorts of things.'

'Is it possible,' Valerie whispered to her friend, 'that Hector has really succeeded in gaining an influence over this Sir Geoffrey by those miserable tricks he played so successfully at Rome?'

'It is very probable,' Isodore murmured in reply. 'This Sir Geoffrey is very weak in intellect.—Tell me, Mr Varley, she continued, turning in his direction, 'does the baronet keep much of Monsieur le Gautier's company? Does he visit at his rooms?'

'I believe he does; anyway, he goes out at nights, and always comes back looking as if he had seen a ghost. Whatever his game may be—and sure enough there is some game on—it's killing him by inches, that's what it's doing.'

'And this change you put down to Le Gautier? Perhaps you are right. And now, another question. Is not there another reason, another attraction besides discussing spiritualism with Sir Geoffrey, that takes him to Grosvenor Square?'

Varley so far forgot himself as to wink impressively. 'You might have made a worse guess than that,' he said. 'I am not the only one who can see what his designs are. Miss Enid is the great attraction.'

'And she?'

'Hates him, if looks count for anything.—And so do I,' he continued; 'and so do all of us, for the matter of that. I would give a year's salary to see his back turned for good!'

'Mr Varley,' Isodore said in grave tones, 'I sent for you here to work upon your fears, and to compel you, if necessary, to do my bidding. That, I see, is not necessary, for we have a common bond of sympathy. For reasons I need not state here, we have good reasons for keeping a watch over this Le Gautier; but rest assured of one thing—that he will never wed your mistress. I shall hold you to secrecy.—And now, you must promise to get my protégée this situation.'

'Well, I will do my best,' Varley replied

cheerfully. 'But how it is going to be done, I really can't see.'

'Irishmen are proverbial for their inventive powers, and doubtless you will discover a way.—The new maid is a French girl, remember, the daughter of an old friend. Perhaps you would like to see her?' With a gesture she indicated Lucrece, who came forward, turning to the Irishman with one of her most dazzling smiles. 'The feeling of bewilderment came on again.'

'She!' he cried; 'that beautiful young lady a servant?'

'When she is plainly dressed, as suitable to her lowly station, she will appear different.'

'Ah, you may pull the leaves from the flowers, but the beauty remains to them still,' Varley replied, waxing poetical. 'However, if it must be, it must; so I will do my best.'

Varley's diplomacy proved successful, for, a week later, Lucrece was installed at Grosvenor Square.

MINERAL SUBSIDENCE.

THE alarming subsidence which took place some time ago in Scotland, on the North British Railway near Prestonpans, and which was fortunately unattended with any accident, has doubtless added a fresh source of fear to the nervous railway passenger. That the permanent way of a railway for a distance of about fifty yards should suddenly sink to the extent of two feet is almost incomprehensible at first; and had this subsidence occurred whilst the train was passing, instead of immediately afterwards, the consequences might have been disastrous. It is the case, however, though it may not be generally known, that subsidences—fortunately only gradual, and comparatively inappreciable—are taking place over many of our railway lines, and that 'minerals' are actually being extracted from underneath nearly every line of railway under which there is any mineral to get.

The damage done to the line at Prestonpans was reported to have been caused by coal-workings which were there long before the railway was laid; but if it was caused by them at all, it was on account of their being influenced by the working of a seam of coal below them, which was going on at the time the subsidence occurred. It is the fact, however, that when a Railway Company acquires ground under its parliamentary powers, the minerals underneath the ground do not pass along with it. This may seem a little surprising at first; but it is not so when it is considered that very frequently the proprietor of the surface of the ground and the proprietor of the minerals underneath it are different persons. Of course the proprietor of an estate under no reservations is proprietor as high as he can sell or as deep as he cares to go; but he may sell or lease the minerals and retain the surface, or *vice versa*. Thus it is that a Railway Company has only, as it were, a right of passage over the surface; and that its right goes no deeper, except for the construction or up-keep of its lines. By Act of Parliament, however, the proprietor of minerals below any railway line, before proceeding to work them, must give notice to the Railway

Company of his intention to do so, so as to give the Company an opportunity of buying him off, should it feel disposed. If it does not declare its option to purchase the minerals, the workings proceed, and the railway has to take its chance. The mineral owner will, however, be held liable, should any damage occur owing to improper working.

The subsidence of a railway line underneath which the minerals have been worked is as a rule very gradual, and extends over some length of time. Many railway passengers must have noticed the walls of waiting-rooms disfigured by ungainly cracks, the stone lintels displaced, the hearthstones awry, and many other signs, which are caused by the working of minerals underneath. Some station-masters can show you on the stone face of the platform the number of inches the line has sunk. As a matter of fact, were it not for the gangs of surfacemen the Railway Companies employ to watch any irregularities in their lines, in a very short space of time the permanent way would in many places probably represent something like the proposed line of the Undulating Railway, a fantastical scheme of long ago. The railway in Ayrshire which runs over the old workings of the famous Wishaw coal-seam, especially suffers in the way of subsidence; and some parts of the railway in the west of Fifo are known to have gradually sunk to an extent of over ten feet.

But railway lines are not the only parts of the surface which are subsiding owing to the working of minerals. The whole surface of the land surrounding the many pits and mines which are continually belching forth their wagon-loads of coal or other mineral, is gradually subsiding as the extraction of the mineral proceeds; and damage amounting to thousands of pounds is annually being done to the surface and the buildings on it owing to mineral workings. As the period and extent of the subsidence and the damage following on it depend greatly on the method employed in working the coal, a word or two here on this subject may not be out of place.

There are two recognised methods of working out coal. The old method is what is known as the 'stoop-and-room' or 'pillar-and-room' system; and the method introduced into Scotland about the beginning of the present century is known as the 'longwall' or 'Shropshire' system of working. The first system explains itself by its name. After the bed of coal is struck, 'rooms' are worked out, leaving 'pillars' or 'stoops' to support the superincumbent strata. The object to be attained in this system, as practised in the olden times, was to have as large a room worked out, and as small a stoop or pillar of the coal itself left, as was consistent with the safety of the mine and the support of the surface, while the mine was open. But this system entailed the entire loss of the pillars so left. To obviate this loss, the method now generally adopted is to drive narrow rooms or passages, seldom exceeding fourteen feet, through the seam, leaving large pillars—about seventy-five per cent. of the mineral—until the extremity of the available coal is reached. When, however, no regard is to be had for the surface, and the coal has been thus worked out as far as can be done, the miner commences

to work backwards, taking out the stoops or pillars as he goes. The whole roof of the mine then comes down; and this is the most dangerous kind of subsidence. It does not only take effect immediately above the place where 'stooping' has been going on, but it also 'draws' round about it.

The 'longwall' or Shropshire method of working is what is known as the system of complete excavation; that is, the miner takes out the whole coal as he proceeds, leaving only perhaps a foot on the roof, should the overlying strata be soft, and props up a passage with wooden supports as he proceeds, to enable him to keep an open way to the face of the coal. The portions worked out are packed on each side of the 'road' with the waste material taken out with the coal. This method of working, though it necessarily implies subsidence, is on the whole the safest for the surface, and is generally the one adopted. In fact, as mineral landlords are paid, in lieu of rent, a royalty or lordship on every ton of coal or other mineral brought to the surface, and as the tenant can more quickly extract the mineral by the wooden props method, he is generally bound in his lease to work in this manner, when practicable.

Should the coal be worked on the stoop-and-room system, and pillars of coal of sufficient size be left in the surface will not be injured to any appreciable extent, at least not for many years. As is often the case, however, seams of coal are worked out one below the other; and when the lower one gives way, the pillars above may fall like a pack of cards. There is no saying where the subsidence would reach in such a case. If the pillars do not break, the way in which the 'rooms' close up, if the floor is soft, is rather peculiar. The roof does not all fall in, as would be expected; but the enormous weight of the superincumbent strata pressing on the pillars causes the floor between them to rise up or 'creep,' and the room becomes closed. On the other hand, if the stoops of coal are taken out, the roof comes down with a crash, and the effects on the surface may be disastrous; but of course it sometimes pays better to get out all the coal and let the surface go, than to allow the workings to get closed up and the coal in the pillars to be lost for ever.

The subsidence following on a 'longwall' working is gradual, but sure. The surface is not broken to any great extent, but comes down in one sheet, and not irregularly, as in stoop-and-room workings. The strata generally come to rest in about three or four years. A row of houses which have been cracked through and through on the subsidence reaching the surface, have been known to close up again when the strata have settled.

The damage done by pillar-and-room workings is irregular both as regards effect and time. It may commence, stop, and commence again. Houses are literally wrecked by it. So palpable is it, indeed, that actually the sound of the crushing and subsiding of the house can be distinctly heard. The slates are twisted off the roof, the chimneys hang in all directions, the walls are rent asunder, the foundations give way, and the house is rendered uninhabitable. An instance of this is to be found in the

salt-workings of Cheshire, in the neighbourhood of which, houses are constantly being wrecked. Thousands of pounds are paid every year by mine-owners for damages done to surface proprietors, farmers, and others; and there is no more fruitful source of litigation than surface-damage.

Even under public roads, we find the minerals being worked. The public have only a right of passage, the minerals underneath belonging to the adjoining proprietor, and it is not an uncommon circumstance in mining districts for a road to suddenly sink several feet.

In the case of a proprietor of minerals in lands adjoining the sea, his right, as a general rule, extends only to high-water mark. Below that line, underneath the foreshore and the sea itself, the minerals belong to the Crown. The Crown, of course, can lease the minerals, and they are very frequently worked under the sea itself. In such a case, great precautions have to be observed in the workings, to prevent any chance of the sea breaking in, though, when the stratum above is rock, the mineral is sometimes worked out within a very few feet of the bottom of the sea! In some mines, the roar of the ocean above can be distinctly heard.

This, however, is a digression from the subject of subsidence. 'Subsidence' of the surface above our almost inexhaustible beds of coal has been going on, and will go on more or less, until that day in the dim futurity which has been foretold, when our coal-seams will have become exhausted, but when, let us hope, the inventive genius of posterity will have discovered another fuel, or done away with the necessity of fuel altogether.

GEORGE HANNAY'S LOVE AFFAIR.

CHAPTER II.—LOVE'S YOUNG DREAM.

For a few days Anne Porkeous felt rather miserable. She was angry with herself for her imprudence in allowing such a misfortune to have happened; her feminine vanity was not in the least hit tickled at having the refusal of the famous editor, for she was not at all of that class of savage females who gloat over the roll of their rejected suitors as a Red Indian does over his string of scalps. No; she felt really and truly vexed for her old and kind friend, though, with the inconsistency of her sex, she could not but feel just the least bit piqued that, seeing he had cared for her so much as to ask her to be his wife, he had taken her unavoidable refusal so calmly and in such good part. She was glad to find, however, he had not forgotten her altogether; although he was now at Lucerne, she got the *Olympic* and other London magazines addressed to her in his familiar splashy handwriting, just as before. But there were no letters now. Formerly, she used to act as correspondent between him and her father, whose fingers were too stiff from rheumatism to make writing convenient. She missed the gay cheerful letters, with their satirical sketches of the lions of the circles he moved in, and their playful banter of herself even. However, one day this postman

brought a letter which turned her thoughts into an entirely different channel. It ran as follows:

BRUSSELS, 19th Sept. 1893.

MY DARLING NAN—I have just time to write this before starting for London by the tidal train. Old Uncle Joseph is dead. I have just got the telegram announcing the event, which took place this morning. I hope he will have left me a good round sum, so that I can start practice at once, and then a certain young lady I know of will not be long of coming to keep house for me. With a thousand kisses—Yours ever,

ALFRED ROBERTSON.

She mused over this letter for a few minutes; something in it jarred on her feelings. She did not quite like the matter-of-fact way in which the writer announced the death of his uncle, to whom he was entirely indebted for his upbringing and education. Nor was she quite pleased at the assured way he spoke of a 'certain young lady' coming to keep house for him. Why, as yet he had not even seen her father—not to speak of his having got no consent to their union. Nan was a pre-eminently practical young woman; but a kind, loving, faithful heart beat in her bosom, and it resented the tone of the note as being callous and far too self-assured. Of course, it was written under a pressure for time; but still it might have contained some little expression of sorrow for the death of one who had done so much for him, instead of hoping for a good legacy.

Alfred Robertson was her engaged lover. She met him at a dancing party given by a mutual friend in le Quartier l'Anglais, Brussels. He was possessed of a stalwart handsome figure, and an agreeable face and voice. That he was clever, might possibly be inferred from the fact that he had carried off quite a number of college honours. That he thought himself clever, didn't require to be inferred from anything—it was stamped on his face, and showed itself in his every look and gesture. Whether Anne saw this, we know not; if she did, it was insufficient to prevent her falling deeply in love with him. A few moonlight strolls under the linden trees, a few soft pressures of the hand, a few sighs and tender speeches, and practical, sober-minded Anne gave her whole heart to this handsome youth—the first who had ever addressed her in the magic accents of love. And he? Well, he loved truly and sincerely enough in his own sort of way, just as he had loved other young ladies before. He was one of those men who seem to hold a power of fascination over the other sex. He did not mean to be a flirt—but how could he help the girls falling in love with him? He couldn't make a brute of himself, and be rude and insolent to them—could he? His conquests were, however, usually of brief duration; for some reason or other not known, his previous love affairs had come to an untimely end. It was generally thought by his friends—and himself too—that his love for Anne was sincere and genuine, and could end in nothing else than matrimony. His uncle's demise would bring matters to a crisis. He had adopted him at an early age, being himself a childless widower. Mr Joseph Robertson was a Scotchman, and had

gone early in life to push his fortune in the great Metropolis. Starting business after a while as a cheesemonger, he had in the course of years managed to scrape together quite a little fortune; and when his brother died, he gladly adopted his only son Alfred, and gave him a first-class education. When he arrived at an age for choosing a business or profession, he expressed a desire to be a doctor, so his uncle sent him to Edinburgh University, where, in due course of time, he received his diploma of M.D. While he was engaged pursuing his medical studies, his uncle took it into his head to marry his housekeeper, Mrs Janet Grant. Alfred did not like this change in the old gentleman's domestic arrangements, for, truth to say, there was little love lost between him and the late housekeeper; but any unpleasant feeling he might have felt in the matter was changed into unmitigated disgust by the advent of a baby-cousin—his uncle's son and heir. The old gentleman was of course delighted at this addition to his family; but it did not make any difference in his treatment of his nephew. He still gave him an allowance of three hundred pounds a year; and as he had now got his professional degree, it was arranged that he should travel on the continent for a year, visiting the various centres of medical science, and making himself acquainted with the latest discoveries, before beginning practice in London. It was while on this tour that he met Anne Porteous.

About a week after receiving her lover's letter, a tall, gentlemanly looking stranger entered the coffee-room of Locheubreck Inn, and, much to the waiting-maid's surprise, asked to see Miss Porteous. Anne did not need to look at the stranger's card; she knew instinctively it was her lover, and there being no one else in the room, she went to meet him. The first fond greetings over, she saw there was something on his mind, and that not of a pleasant nature. She was not long kept in suspense.

'Do you know, Nan, I have been swindled—thoroughly swindled? After my uncle's funeral, I waited to hear the will read, of course. The family lawyer was there; and he said there was no will. His client, he said, had been talking some time ago of making one, and had even given him some general directions about it; but he says it was never executed, and that the scheming old housekeeper and her brat are heirs to all. Isn't it shameful?'

'Well, Alfred dear,' Anne replied in a consolatory tone, 'you know they were nearer to him than you could ever be, and you mustn't grudge them taking what is justly their own. Besides, remember how kind your uncle was to you in his lifetime. Look at what a lot of money he spent on your education and in fitting you for a profession.—But did your aunt give you nothing—not even a remembrance of your uncle?'

'Well, yes,' he grumblingly rejoined; 'she gave me a cheque for a hundred guineas, and had the impudence to tell me she never wanted to see my face again.'

'And you took it?'

'Why, yes. Why shouldn't I?'

'Well, Alfred, if I had been in your place, I would not have accepted of a gift given in such a spirit. However, it will be useful when you begin

practice, which I suppose you will be doing at once now.'

'Start business as a doctor in London, with only a hundred pounds to fall back on! Why, Nan, you're surely joking. But I forget: girls don't understand these matters.'

'Then, what do you purpose doing?' she asked anxiously.

'Oh, my mind is quite made up as to that,' he said, drawing himself up proudly. 'I intend devoting myself to literature.'

'And throw away all your medical study and training for nothing,' she exclaimed. 'Surely, that would be folly, Alfred.'

'There's no folly about it,' he answered. 'Lots of fellows, without half the education or, I may say, ability that I possess, make a thousand or two a year by writing science articles, stories, and what not for the monthlies. I'm told it's about the best paying thing that's going. And then, you see, it does not require any capital. You just jot down your thoughts on a quire of paper, forward it to an editor, and you get a cheque back by return of post for twenty or thirty guineas—or far more, if your name is well known—as mine will soon be,' he added confidently.

This piece of news was not very pleasant to poor Nan. To be a doctor's wife in a year or two was an agreeable enough prospect, especially when she so fondly loved the man. But to enter on matrimony with no more assured means of living than the honorariums which fall to the lot of an ordinary literary hack, was a bleak outlook. How often had she heard Mr Hannay aver that not one in a hundred who tried literature as a profession succeeded in earning a decent living. True, Alfred must be very clever, from the number and value of his college prizes; but then, hadn't her old friend often said that education had but little to do with literary success, and that he had rejected more manuscripts from college-bred would-be contributors than from any other class. She did not fear a life of haphazard poverty for herself; but her woman's instinct told her that it would press hardly on Alfred. She was not blind to the imperfections of his nature; she was far too clear-headed for that. But she regarded him from two distinctly different points of view: from the one, her common-sense showed him in all his human imperfections and failings; from the other, or ideal one, he appeared as a being so far exalted above the common herd of men that to love and serve him all the days of her life would be her chiefest joy and happiness. As the stereoscope projects two different images into one more seemingly real than either taken singly, so did her woman's love commingle these diverse impressions of her lover into a glorified and lovable whole. Who on this earth could be to her what he was to her? Not being of an exacting or jealous nature, she had never asked herself the question—Did he love her as she loved him? If she had done so, she would have smiled in scorn at the very suggestion of such a mean doubt; for did not she remember his warm, trembling words of love—his soft sighs and tender caresses—his declarations of hopeless despair, if she withheld her heart from him? It certainly was a pity this abandonment of his profession; but then, it might only be a temporary one. He perhaps might find that, clever as he was, the paths leading to literary success were

steeper and less flowery than he imagined. If so, then, of course, he would start practice, and all would yet be well. The slight shadow on her countenance cleared off. She said: 'Well, Alfred, you should know best—perhaps you are right. Come and I'll take you to our private parlour. Papa is sitting out in the garden. I must bring him in and introduce him to you.—He must know all now,' she added with a slight tremor. She had put off the evil day as long as she could; but further concealment was now impossible.'

It was with faltering accents she confessed her secret to the old gentleman, as she sat down beside him in the garden arbour. If she had informed him that Lochenbreck had suddenly run dry, he could not have been more astonished. Then he got angry, and made use of some very uncomplimentary expressions regarding Anne and her sex in general. But he was a man of sense and feeling at heart; and when he saw the hot tears coursing down her cheeks, he checked himself at once, caressed her, and told her not to make a fool of herself. He knew Anne's character too well to think that he, or any one, could prevent her permanently from doing anything her heart was set on, and which her sound moral consciousness told her was right and justifiable. He, it is true, had cherished secret hopes that his old friend Hammy might have taken a fancy for the girl, and he would have parted with her to him freely; now he was asked to give her to a man that he had never yet seen. It was monstrous; but then girls always do act in a ridiculous and contrary manner in these matters of love.

'Well, Nan, I'll see the lad—there can be no harm in that; and I'll not thwart your happiness if I find him deserving of you.'

Ay, there was the rub. Was he, or almost any one else in the world, deserving of his Nan?

Seated in the cosy parlour, and the embarrassment of the unexpected introduction over, Nan prudently withdrew, leaving the two gentlemen to feel their way into each other's acquaintance over a bottle of claret and a box of cigars. Alfred was a good talker, easy, self-possessed, and even genial in his style.

He felt no diffidence in proposing for Anne; true, meantime he was almost impecunious, and had no established or certain means of living; but he was a gentleman, well educated and bred, and, as he inwardly thought, a very eligible son-in-law for any innkeeper in the land. Anne was now called in, and blushing joined in the conversation. The suitor pressed for an immediate union. This was, however, decisively negatived by both father and daughter. Porteous had been favourably impressed by his proposed son-in-law; but when he learned that his future income was to be derivable solely from literary emoluments, it became him to act in the matter with great caution, for the sake of his daughter's future. If this literary venture was to be gone into, its success must be thoroughly demonstrated in actual pounds, shillings, and pence, before the marriage could take place. Anne thought this a reasonable stipulation: her lover didn't. His pride felt hurt at finding obstacles where he imagined he had an easy walk over. He had, however, to pocket his pride and submit to the inevitable. On these conditions the lovers became engaged, with the old gentleman's approval. A

great weight of concealment was now off Anne's mind. Her spirits rose, and for a few brief days the happy pair abandoned themselves to the innocent delusions and delights of 'Love's young dream.'

Anne was the first to awake to the realities of life. She was nothing if not practical, and she soon realised that all this sweet billing and cooing was but a waste of time. Her knight must go forth into the tournament of life, gain his trophies, and then come back to claim her as his guerdon.

'Now, Alfred,' she said one day, 'I think it is high time you should put your literary projects into execution. That, you can't well do here. I think you should take a cheap lodging in Edinburgh, or some place where you would have the advantage of good reference libraries, and set to work at once.'

'True, Nan; I must think of making a start one of these days.—But you don't wish me away, dearest, do you?' he said in a tender way.

'Oh, you know well enough I don't!' she returned with the slightest trace of impatience in her tone. 'But if we are to get married, it will not be by your idling your time away here. You'll find a hundred pounds won't keep you long in a large city; and think in what an awkward position you would be, if it got done before you found a regular and profitable market for your literary work.'

He was forced to admit the soundness of the advice, which was emphatically indorsed by Mr Porteous. So, the following day he packed up his traps; and the evening found him established in a modest lodging in Nicolson Street, Edinburgh, which had formerly known him as a student.

The lovers might have served as a model for all others so situated, in the regularity and length of their communications to each other. For fully a month, Alfred wrote in the brightest of spirits. He was engaged on a lengthy paper, 'A Comparative Analysis of the Literature of Greece and Rome.' This was intended for a famous London quarterly; he would act prudently, however, and would not commit himself until he had ascertained the very highest sum obtainable for it.

This first venture was completed and posted. In a few days the manuscript was returned with a polite note from the editor. The paper, he admitted, was well written, although not containing any particularly new views on the subject; and at any rate there was no demand for classic literature on the part of the reading public at present: therefore, he was under the necessity of declining it with thanks, &c. He sent it to some other magazines; but the result in substance was the same. He was surprised and disappointed, of course; but buoyed up by his own self-esteem and Anne's kind sympathetic letters, he determined to make a new venture on different lines. He had been very successful in taking prizes in the science classes at college. The science of optics was a strong point with him, so he set to to compose 'A Dissertation on the Polarisation of Light.' This he sent when completed to a celebrated science monthly. The manuscript was returned, and the note accompanying it was discouraging. The editor thought

the article fairly well written, and the facts and theories were correctly given so far as it went, but it was rather behind the times. Repulsed in the higher branches of his chosen profession, he now condescended to write ordinary magazine sketches and stories; but still the long-looked-for success failed to come. He wrote scores of papers—tales, social sketches, &c.; but not one of them found their way into print. In most cases they were returned with a printed form of letter, expressive of the editor's regret at being unable to use the manuscript. In some cases, however, they were good enough to append a line or two of criticism. One said his style was a little stilted, and that he used too many long-syllabled words. Another said, in effect, that he lacked dramatic instinct in the grouping of his incidents and characters, and that the plot was bald and destitute of any probable *motif*. Many never returned his manuscripts at all, or paid the least attention to his oft repeated inquiries regarding them. Disheartened by these repeated failures, it was with delight he read in one of the daily papers an advertisement addressed 'To Authors.' The advertiser, who seemed to be of a philanthropic disposition, professed deep sympathy with the difficulties that beset the path of young aspirants to literary fame. Many a splendid intellect, the advertisement went on to say, had been doomed to languish in obscurity through the want of enterprise of selfish publishers. It was his (the advertiser's) wish to assist struggling merit—in other words, to enable young authors to publish their works on exceptionally favourable terms. Letters inclosing a stamped envelope for reply, and addressed to 'Author,' G. P. O., London, would receive instant attention.

'The very thing to meet my case,' said Alfred to himself. 'I'll write a novel, and then these beggarly editors will see how the public will appreciate my writings.' In high spirits he wrote a letter asking further particulars from the literary philanthropist; and in due course received a courteous reply, stating that if he forwarded the manuscript of the proposed work when finished, it would be examined carefully, and, if judged worthy, would be published on the 'half-profit' system—that is, the resulting profits to be equally divided between the author and the advertiser. It was necessary that a registration fee of ten guineas should be paid in the first instance; this, however, was only as a guarantee of bona fides, and it would be returned when the book was published. The requisite fee was at once forwarded; and Alfred set to work in great spirits to compose a short high-class novel; he purposed giving the story a literary *personnel*, to afford him an opportunity of holding up to his readers' derisive scorn the ridiculous pretensions of ignorant London editors. He wrote to Anne, and depicted in glowing terms the brilliant prospects before him in the near future; and putting his whole soul in his work, and working twelve hours a day, he finished his story (which was somewhat after the style of the *Castles*) in less than two months. In sending it to London, he earnestly requested that it should be put in type and published with the least possible delay. The manuscript was duly acknowledged, and compliance with his request promised. It had been handed to the

reader, who would at once set to work on it; and his fee was ten guineas, payable in advance. Poor Alfred's store of sovereigns was now pretty well reduced, and it was with reluctance that he sent this second remittance. In a week his manuscript was returned with a polite note, saying that while the story showed germs of genius, it was not of sufficient general literary merit to warrant publication. Inquiries made through a London friend revealed the fact that he had been the victim of a used-up penny-a-liner, a man without means, influence, or respectability, who made a discreditable living by playing on the credulity and vanity of amateur authors. Dark despair would have taken hold of most people in his circumstances; his money was now reduced to a trifle; his health affected by his prolonged and severe efforts; but his self-esteem was in no way abated. He still believed literature to be his forte, and determined to give it one more chance. First of all, though, he required rest; and having an invitation from Nan, he took the train one day for Lochenbreck, where he arrived with a portmanteau full of rejected manuscripts, and ten pounds in his pocket.

BLEEDING-HEART YARD.

WITH the demolition of Bleeding Heart Yard, many a pilgrim to London will have one goal the less. But it has been too graphically pictured in *Little Dorrit* ever to be forgotten. Of all Dickens' many sketches of the London slums, this is one of the best, although it requires great imaginative powers now to recognise here any 'relish of ancient greatness.' The 'mighty stacks of chimneys,' now much the worse for wear, are still here, and still 'give the Yard a character.' But the poor people who had 'a family sentimental feeling' about the Yard have nearly all flitted, like rats from a sinking ship. Indeed, piles of massive warehouses, which have sprung up on all sides, have already almost swamped their habitations; and any one seeing them in the gray gloaming of a wet winter afternoon, will bave some difficulty in devising pleas for their preservation. The Yard is altogether dreary and unlovely, now that it is deserted, save for a couple of workshops, which, possibly, have replaced the factory of Daniel Doyce. A few carriers' carts and costers' barrows, too, seem to have been left here by accident. But for the most part the picture is one of dilapidated desolation. The three-storied brown-brick houses with their low-pitched red-tiled roofs, that run down the southern side, seem to have been the scene of an explosion or a conflagration; or, possibly, they may have been besieged by an army of urchins. Anyhow, not a pane of glass remains in the windows, which were probably cut through the wall at odd times, when wanted; and but for a tattered fringe which still decorates the frames, they might never have been glazed. Some of the cart-sheds and stables which form the ground-floor—to use an appellation that properly belongs

to suburban villas—have been converted into shops, but bear no signs of ever having done a thriving trade; and it is easy to believe that the Yard, 'though as willing a yard as any in Britain,' was never 'the better for any demand for labour.'

But whatever its past, before very long it will have been improved away, and visitors will probably soon have some difficulty in finding out even its site. The witchery of Dickens is shown in nothing so much as the atmosphere of vivid actuality with which he surrounded nearly all his characters, and the localities in which they lived and moved. For years, crowds have paid visits of devotion to the shrines which he has surrounded with such a halo of romance; and he possessed in a remarkable degree the faculty of appropriating all the charm with which legend and tradition had surrounded spots, and endowing them with a new glamour, until he made himself the true *genius loci*. His knowledge of London was certainly 'extensive and peculiar.' It would be easy to name a dozen nooks within a stone's throw of Holborn alone which he made his own. The narrow and crowded streets which, when Dickens wrote, were even more squalid than they are now, had for him an irresistible attraction. From his chambers in Furnival's Inn as a centre, he was a veritable explorer in all directions; and he has painted for us with his pen a series of sketches of these courts and alleys the realism of which the pencil of even George Cruikshank could not rival.

The nomenclature of London presents an endless succession of problems which never seem to get much nearer solution; and so far as many disputed sites are concerned, there is every likelihood that they will soon be removed from the field of controversy by being obliterated and altogether forgotten. It is notoriously a perpetual cause of surprise to foreigners, and especially our American cousins, that we are so heedless of being a nation with a history as to take no pains to preserve our historical landmarks. There are a thousand-and-one buried sites in the streets of London alone, which have played their parts in our national and municipal development, and there is none that cares to put up a stone to preserve their traditions from oblivion. But for Bleeding Heart Yard no very heroic etymology can be claimed. Dickens, it is to be feared, drew largely on his imagination, which he doubtless found served him in better stead than any number of old folios, for his amusing derivations. Except in *Little Dorrit*, there seems to be but scanty authority for the tradition that this was the scene of a murder. It is, however, beyond dispute that Ely Place and the adjacent streets were occupied by the luxurious town palace of the Bishops of Ely. Within the walls were included twenty acres of ground. This was, about the year 1577, sold to Christopher Hatton by the Bishop of Ely, who was, however, only made to carry out the contract by Elizabeth's memorable threat that otherwise she would unfrock him. It was here that the famous chancellor died in

1591. But his house and garden do not seem to have been demolished until the middle of the seventeenth century, for Evelyn, writing in 1659, tells us how he went to see 'the foundations now laying for a long street and buildings in Hatton Garden, designed for a little town, lately an ample garden.' Of a certain Lady Hatton, probably the wife of Sir Christopher's great-nephew, it is gravely recorded that she had a compact with the Evil One, and that on the night when this came to an end, that personage, in the guise of a cavalier, attended certain festivities which were being held at Hatton House, and having lured her into the garden, tore her in pieces—her 'bleeding heart' being afterwards found. But if this weird legend had even so solid a foundation as a murder, it is probable that some record of it would have survived.

Little Dorrit is also the authority for the story of the young lady who was closely imprisoned in her chamber here by her cruel father for refusing to marry the suitor he had chosen for her. The legend related how the young lady used to be seen up at her window behind the bars, murmuring a love-lorn song, of which the burden was, 'Bleeding heart, bleeding heart, bleeding away,' until she died. It will be remembered that although the Yard was divided in opinion, this story carried the day by a great majority, notwithstanding that it was supposed to have originated with 'a tambour-worker, a spinster, and romantic,' living in the Yard.

It is scarcely necessary to say that the point has received the attention of the seekers after miscellaneous knowledge, and a number of alternative derivations have been suggested. One learned antiquary, for instance, reminds us that 'bleeding heart' is the name of the red wallflower in certain parts of England, but omits to point out the connection. The most plausible is the suggestion that the court may have taken its name from a hostel known as the *Bleeding Hart*, and it is well known that sign-painters frequently prove shaky in their orthography. Thus, he records that in Warwickshire, an inn known as the *White Hart* was some years since adorned with a signboard representing a human heart, or at least an ace of hearts. Then some people still cling to the belief that the sign of the Bleeding Heart dates from pre-Reformation times, and is emblematical of the five sorrowful mysteries of the rosary. We must leave it to others to reconcile these conflicting theories. But for its associations with the fortunes of *Little Dorrit*, the bare existence of the court would certainly have remained in oblivion, and its demolition would have excited no unusual regret.

But there are those for whom the Yard has been associated with the history of a set of very real personages. Hither many folk have gone in search of 'the domicile of Plornish, plasterer,' and have sought to identify 'the parlour' in which the Plornish family lived, and which was pointed out to callers by 'the painted band, on the forefinger of which the artist had depicted a ring, and a most elaborate nail of the gentlest form.' Here, too, they have probably pictured for themselves the Patriarch 'floating serenely through the Yard in the forenoon' with the

express purpose of getting up trustfulness in his shining bumps and silken locks, to be succeeded a few hours later by Pancks, that prince of rent-collectors, who, 'perspiring, and puffing and darting about in eccentric directions, and becoming hotter and dingier every moment, lashed the tide of the Yard into the most agitated and turbid state.' They may further have looked for the small grocery and general dealer's shop 'at the crack end of the Yard,' where Mrs Plornish was established by Mr Dorrit; and for 'Happy Cottage,' that most wonderful of interiors. And they may have wondered whereabouts was the spot where Pancks tackled the Patriarch, snipped off short the sacred locks, and cut down the broad-brimmed hat to a stepman, thereby converting the venerable Custy, 'that first-rate humbug of a thousand guns,' into 'a bare-polled, goggle-eyed phantom.'

FLEET STREET MARRIAGES.

It is said that the Fleet Street marriages of London originated with the incumbents of Trinity, Minories, and St James's, Duke Place. The incumbents claimed to be exempt from the jurisdiction of the Bishop of London, and performed the marriages without banns or license. It is not exactly known in what year these gentlemen started their lucrative profession; but one named Elliot, who was rector of St James's, was suspended by the Bishop of London in 1616 for performing these ceremonies. The trade was then taken up by clerical prisoners living within the Rules of the Fleet; and Mr Burn tells us that, as a rule, these were just the men—having neither money, character, nor liberty to lose—to adopt the profession; and he further says that they were in the main 'lusty jolly fellows, but thorough rogues and vagabonds, guilty of various offences.' That they were not ashamed of the business is evident from the fact that they advertised in the *Daily Advertiser* of that year to the following effect: 'G. R.—At the true chapel, at the old *Red Hand and Mire*, three doors up Fleet Lane, and next door to the *White Swan*, marriages are performed by authority by the Rev. Mr Symson, educated at the university of Cambridge, and late chaplain to the Earl of Rothes.—N.B. Without imposition.'

'J. Lilley, at the *Hand and Pen*, next door to the China Shop, Fleet Bridge, London, will be performed the solemnisation of marriages by a gentleman regularly bred at one of our universities, and lawfully ordained according to the institutions of the Church of England, and is ready to wait on any person in town or country.'

There must have been great competition in the business, for we are told that there might be seen in corners of windows tickets stating 'Weddings performed cheap here,' 'The Old and True Register,' &c. But the great trade was at the 'marriage houses' whose landlords were also publicans, the *Bishop Blaire*, the *Horseshoe and Maggie*, the *Fighting Cocks*, the *Sawyers*, the *Hand and Pen*, the *Bull and Garter*, and the *King's Head*, the last two being kept by warders of the Fleet prison.

The parson and landlord—the latter usually acting as clerk—divided the fees between them,

after paying a shilling to the tout who brought in the customers.

The *Grub Street Journal* of January 1735 has the following: 'There are a set of drunken, swearing parsons, with their myrmidons, who wear black coats, and pretend to be clerks and registers of the Fleet, and who ply about Ludgate Hill, pulling and forcing people to some peddling alehouse or brandy-shop to be married; even on a Sunday, stopping them as they are going to church and almost tearing their clothes off their backs.'

This is confirmed by Pennant, who says: 'In walking along the streets in my youth, on the side next the prison, I have often been tempted by the question, "Sir, will you be pleased to walk in and be married?" The parson was seen walking before his shop, a squallid, profligate figure, clad in a tattered plaid nightgown, with a fiery face, and ready to couple you for a dram of gin or a roll of tobacco.'

Ladies who were possessed, or supposed to possess means, were often kidnapped and forced to marry ruffians whom they had never seen. For instance, we read that a young lady of birth and fortune was forced from her friends, 'and by the assistance of a wry-necked swearing parson, married to an atheistical wretch, whose life was a continual practice of all manner of vice.'
